

Transformations of *cyclobutyldiethylcarbinol*. NICOLAI M. KIJNOR (*J. Russ. Phys. Chem. Soc.*, 1911, 43, 1149—1157).—As it has been found that all the transformations of *cyclobutyldimethylcarbinol* are accompanied by isomerisation of the four-membered into a five membered ring, it is necessary to reconsider the transformations undergone by *cyclobutyldiethylcarbinol* (compare Kijnor and Amosoff, *Abstr.*, 1905, i, 772). If, with the latter, the changes are similar to those occurring with the former, the action of oxalic acid on *cyclobutyldiethylcarbinol* should give 1:2-diethyl- Δ^1 -cyclopentene, whilst the action of alcoholic potassium hydroxide on the iodo- or bromo-derivative corresponding with the alcohol should yield 1:1-diethyl- Δ^2 -cyclopentene. In the latter case it is, indeed, found that the resulting product is an unsaturated hydrocarbon, C_9H_{16} , which differs from that given with oxalic acid, and yields oxidation products in complete agreement with the conclusion that it is 1:1-diethyl- Δ^2 -cyclopentene. It is hence to be assumed that the action of hydrobromic (or hydriodic) acid on the alcohol is accompanied by isomeric change of the carbon ring, and so gives rise to 1:1-diethyl-2-bromocyclopentane.

(With W. AMOSOFF.)—1:2-Diethyl- Δ^1 -cyclopentene, $\text{CH}_3\begin{matrix} \text{CH}_2\cdot\text{C}^1\text{Et} \\ \text{CH}_2\cdot\text{C}^2\text{Et} \end{matrix}$ formed by the action of oxalic acid on *cyclobutyldiethylcarbinol* and

previously given as $\text{CH}_3\begin{matrix} \text{CH}_3 \\ \text{CH}_2 \end{matrix}\text{C}^1\text{C}^2\text{Et}$ (*loc. cit.*), has b. p. 151.5—152°/774 mm., and is also obtained as a by-product in the synthesis of the carbinol itself. In the reaction with oxalic acid there is no isomeric change of the tertiary into secondary alcohol, such as occurs with *cyclobutyldimethylcarbinol*. Reduction of this hydrocarbon with concentrated sulphuric acid yields (1) a saturated hydrocarbon, C_9H_{18} (*loc. cit.*), isomeric with that obtained by reducing *cyclobutyldiethylcarbinol* with hydriodic acid, and (2) an unsaturated dimeride of 1:2-diethyl- Δ^1 -cyclopentene, $\text{C}_{18}\text{H}_{32}$, b. p. 295—300°, or 168—173°/15 mm.

The two hydrocarbons of the formula C_9H_{18} have probably structures:

has b. p. 143.5—144.5°/754 mm., D_4^{20} 0.8084, n_D^{20} 1.4455, and gives a green coloration with concentrated sulphuric acid and alcohol. On oxidation with permanganate, it yields an acid, $C_9H_{16}O_4$, which crystallises from light petroleum in needles, m. p. 85°, and forms an anhydride, C_9H_{14} , $\begin{array}{c} \text{CO} \\ \diagup \quad \diagdown \\ \text{CO} \end{array} \text{O}$, m. p. 10—11°, D_4^{20} 1.1077, n_D^{20} 1.4689, an anilic acid, $\text{CO}_2\text{H} \cdot \text{C}_7\text{H}_{14} \cdot \text{CO} \cdot \text{NHPh}$, crystallising from aqueous methyl alcohol in slender needles, m. p. 142°, and an anil, $\text{C}_7\text{H}_{14} \cdot \begin{array}{c} \text{CO} \\ \diagup \quad \diagdown \\ \text{CO} \end{array} \text{NPh}$, separating from benzene in silky needles, m. p. 163°. On reduction with sulphuric acid, 1:1-diethyl- Δ^2 -cyclopentene gives 1:2-diethylcyclopentane.

2-Bromo-1:1-diethylcyclopentane, $C_9H_{17}\text{Br}$, has b. p. 105—106°/24 mm., D_4^{20} 1.2005, n_D^{20} 1.4695, and, on reduction with a copper-nickel couple, gives 1:1-diethylcyclopentane, $C_9H_{18}\text{Et}_2$, b. p. 150.5—151° mm., D_4^{20} 0.8028, n_D^{20} 1.4388. T. II. P.

Syntheses in the Fatty Aromatic Series. II. JULIUS v. BRAUN [with H. DEUTSCH and O. KRUBER] (*Ber.*, 1911, 44, 2867—2881. Compare Abstr., 1910, i, 843).—At the present time there are, for the conversion of an alcohol into the next higher homologue, three practical methods, represented by the following schemes: (i) $\text{R} \cdot \text{OH} \rightarrow \text{RCl} \rightarrow \text{R} \cdot \text{CN} \rightarrow \text{R} \cdot \text{CO}_2\text{H} \rightarrow \text{R} \cdot \text{CO}_2\text{Et}$; $\text{R} \cdot \text{CH}_2 \cdot \text{OH}$, (ii) $\text{R} \cdot \text{OH} \rightarrow \text{RBr} \rightarrow \text{R} \cdot \text{MgBr} \xrightarrow{\text{CH}_2\text{Ph}} \text{R} \cdot \text{CH}_2 \cdot \text{OH}$, (iii) $\text{R} \cdot \text{OH} \rightarrow \text{RCl} \rightarrow \text{R} \cdot \text{CN} \rightarrow \text{R} \cdot \text{CH}_2 \cdot \text{NH}_2 \rightarrow \text{R} \cdot \text{CH}_2 \cdot \text{NH}_2 \xrightarrow{\text{PCl}_5} \text{R} \cdot \text{CH}_2\text{Cl} \rightarrow \text{R} \cdot \text{CH}_2 \cdot \text{OH}$. All these methods are efficacious for the conversion of γ -chloropropylbenzene into δ -phenylbutyl alcohol, method (ii) giving the best result. For the synthesis of yet higher alcohols, however, only methods (i) and (iii) are practicable, the latter being the more convenient, since larger quantities can be manipulated at a time. In this way derivatives of phenylheptane have been prepared.

Ethyl γ -phenylbutyrate, $\text{CH}_2\text{Ph} \cdot \text{CH}_2 \cdot \text{CH}_2 \cdot \text{CO}_2\text{Et}$, b. p. 130—131°/10 mm., is reduced by sodium and alcohol to δ -phenylbutyl alcohol, $\text{CH}_2\text{Ph} \cdot [\text{CH}_2]_2 \cdot \text{CH}_2 \cdot \text{OH}$, b. p. 140°/14 mm., in 70% yield; the alcohol, which has a strong, unpleasant odour, forms a phenylurethane,

m. p. 51—52°, and is converted by concentrated hydrobromic acid at 100° into δ -bromobutylbenzene, b. p. 131—133°/12 mm. ϵ -Phenylamyl alcohol, $\text{CH}_2\text{Ph} \cdot [\text{CH}_2]_3 \cdot \text{CH}_2 \cdot \text{OH}$, b. p. 155°/20 mm., can be prepared in less than 50% yield from this bromide, magnesium, and trioxymethylene, but is obtained quantitatively by converting ϵ -chloroamylbenzene into ϵ -phenylamyl acetate, $\text{CH}_2\text{Ph} \cdot [\text{CH}_2]_3 \cdot \text{OAc}$, b. p. 155°/12 mm., by boiling acetic acid and potassium acetate and hydro-

ing the ester by alcoholic alkali; it has an extremely pleasant, but very persistent, odour of citron.

Phenylheptonitrile, $\text{CH}_2\text{Ph}(\text{CH}_2)_6\text{CN}$, b. p. 160—164°/13 mm., prepared from *ε*-iodohexylbenzene and potassium cyanide in boiling anisic alcohol, yields by hydrolysis *ε*-phenylheptoic acid, b. p. 150—150°/17 mm. (*ethyl ester*, b. p. 161—163°/13 mm.), and by reaction with sodium and alcohol, *ζ*-phenylhexylamine,

b. p. 144—146°/15 mm., which absorbs moisture and carbon dioxide; forms a *picrate*, m. p. 99—100°, *benzoyl derivative*, m. p. 59—61°, *tinichloride*, m. p. 216—220° (decomp.), *aurichloride*, m. p. 71—72°, *quaternary methiodide*, $\text{CH}_2\text{Ph}(\text{CH}_2)_5\text{NMe}_3\text{I}$, m. p. 172°.

Chlorohexylbenzene, $\text{CH}_2\text{Ph}(\text{CH}_2)_5\text{Cl}$, b. p. 142—146°/15 mm., prepared by fusing the preceding benzoyl derivative with phosphorus pentachloride, has a pleasant odour less intense than that of *ε*-chlorohexylbenzene, and is converted into the almost odourless *ζ*-iodohexylbenzene, b. p. 168—173°/15 mm., by sodium iodide in the usual manner. *ζ*-Phenylhexyl alcohol, b. p. 160—161°/13 mm., obtained by reduction of ethyl *ε*-phenylhexoate, has a not particularly pleasant odour, less intense than that of the phenylamyl alcohol, forms an *acetate*, b. p. 166—168°/13 mm., and is converted by concentrated hydrochloric acid at 120° into the preceding chlorohexylbenzene, and by hydrobromic acid at 125° into *ζ*-bromohexylbenzene, h. p. 161—161°/17 mm.

Phenylheptonitrile, $\text{CH}_2\text{Ph}(\text{CH}_2)_6\text{CN}$, b. p. 173—178°/15 mm., arising from iodoheptylbenzene and potassium cyanide, has a very strong, persistent odour, and yields by hydrolysis *ζ*-phenylheptoic acid, b. p. 205—210°/17 mm. (*amide*, m. p. 89°), from the *ethyl ester*, b. p. 177—177°/16 mm., of which is obtained *η*-phenylheptyl alcohol,

b. p. 170—172°/15 mm. This alcohol has a pleasant odour of roses, which is less intense than that of the phenylhexyl alcohol (attention particularly called to the alternating intensity of the odour of the homologous alcohols); its *acetate* has b. p. 188—190°/24 mm. *η*-Phenylheptylamine, h. p. 159—160°/16 mm., obtained by the action of the preceding nitrile, forms a *picrate*, m. p. 120—122°, *tinichloride*, m. p. 210—213° (decomp.), *aurichloride*, m. p. 103°, *quaternary methiodide*, $\text{CH}_2\text{Ph}(\text{CH}_2)_6\text{NMe}_3\text{I}$, m. p. 164°. By distillation of its oily benzoyl derivative with phosphorus pentachloride is obtained *η*-chlorohexylbenzene, b. p. 159—164°/17 mm.; the corresponding *bromide* and *iodide* have b. p. 170—175°/15 mm. and 184—184°/17 mm. respectively. The iodide combines with trimethylamine to form the preceding methiodide.

η-Chloroethylbenzene is conveniently obtained by reducing benzyl chloride with sodium and alcohol, and distilling the benzoyl derivative to the resulting *β*-phenylethylamine (which need not be isolated) with phosphorus pentachloride; the yield is 65—70%. C. S.

Trinaphthylmethane Compounds. ALEXEI E. TSCHITSCHIBABIN *Russ. Phys. Chem. Soc.*, 1911, 43, 1022—1039.—Further investigation of the alcohol described by Schmidlin and Massini (Abstr., 1904, C. i.

1909, i, 563) as tri- α -naphthylcarbinol and of the hydrocarbon regarded as tri- α -naphthylmethane, obtained by the author by reduction of the carbinol (this vol., i, 436), shows that these compounds are really α -naphthyl-di- α -naphthylfluorol alcohol (I) and α -naphthyl-naphthylfluorene (II) respectively:

This stable carbinol, described by Schmidlin and Massini, is found to be formed as a result of the oxidising action of atmospheric oxygen on the unstable tri- α -naphthylcarbinol, with which it has no reaction in common, thus: $\text{C}_{31}\text{H}_{22}\text{O} + \text{O}_2 = \text{C}_{31}\text{H}_{20}\text{O} + \text{H}_2\text{O}_2$. This oxidation may also be carried out by means of neutral permanganate solution. These constitutions of the two compounds and that of the reduction product of the stable carbinol referred to above are confirmed by the previous and also by new analytical results.

Contrary to the opinion of Schmidlin and Massini, the yellow colour of the bromo-derivative (see below) of α -naphthyl-di- α -naphthylfluorol alcohol is probably due to its paraquinonoid structure,

Also the red colour of the solution of this alcohol in sulphuric acid may be due to the formation of an oxonium compound,

and the blue colour obtained on heating this solution to loss of water and formation either of a carbonium salt, $(\text{C}_{10}\text{H}_7)_2\text{:C:OSO}_3\text{H}$, or, more probably, of a complex compound of the type

Di- α -naphthyl ketone, obtained by the oxidation of di- α -naphthylcarbinol with sulphuric acid and potassium dichromate, forms large yellow prisms, m. p. 98°. In view of the higher melting point (104°) of the colourless compound obtained by Schmidlin and Massini (ibid., 1909, i, 561), it is regarded as possible that this ketone exhibits polymorphism.

Tri- α -naphthylcarbinol, $\text{C}_{31}\text{H}_{22}\text{O}$, prepared by the interaction of di- α -naphthyl ketone and magnesium α -naphthyl bromide in presence of ether, forms compounds with both ether and benzene, the former showing the greater inclination to oxidise in the air; both these compounds dissolve with some difficulty in sulphuric acid, giving pale yellow solutions, whilst the stable carbinol dissolves readily and forms an intense red solution. The amount of the solvent in the dry benzene compound cannot be determined by analysis. The carbinol free from solvent forms drusy masses of large, colourless prisms, m. p. 140–150° (decomp.). The hydroxyl group of tri- α -naphthylcarbinol is readily replaceable by halogens; thus the action of hydriodic acid in the cold on an acetic acid solution of the carbinol gives iodotri- α -naphthylmethane, $\text{CI}(\text{C}_{10}\text{H}_7)_3$, which crystallises in slender, unstable, white needles, decomposing at 159°; the corresponding bromo-derivative forms slender, white needles, m. p. 178° (decomp.).

Naphthyl-di- α -naphthylfluorol alcohol, obtained by oxidation of α -naphthylcarbinol, crystallises from acetic acid in yellow prisms, m. p. 165°, and does not give the reaction for hydroxyl. **α -Naphthyl-naphthylfluorol bromide**, $C_{21}H_{19}Br$, forms an intensely lemon-yellow crystalline powder, decomposing at 215—218°, and gives a blue solution with concentrated sulphuric acid. Reduction of the bromide with hydriodic acid yields α -naphthyl-di- α -naphthylfluorene, m. p. 191°, identical with that obtained by reduction of α -naphthyl-di-naphthylfluorol alcohol (compare this vol., i, 436). T. H. P.

Preparation of Cholesteryl Ethers. ORTO DIELS and PAUL FUNKER (Ber., 1911, 44, 2847—2851).—The following cholesteryl ethers have been prepared by heating magnesium and cholesteryl chloride with the corresponding alcohol; the numbers in parenthesis indicate the temperature and time of heating. **Methyl ether**, $C_{27}H_{45}OMe$, m. p. 84° (125°, twelve hours); **ethyl ether**, $C_{27}H_{45}OEt$, m. p. 88—90°, long needles (140°, eighteen hours); **propyl ether**, $C_{27}H_{45}OPr$, m. p. 99.5—100.5°, long prisms (140—150°, six hours); **butyl ether**, m. p. 114—115° (Obermüller gives 78°) (170°, seven hours). An attempt to prepare α -cholesteryl methyl ether from magnesium, cholesteryl chloride, and methyl alcohol (140°, eight hours) led to the formation of a hydrocarbon, $C_{27}H_{46}$, m. p. 56°, leaflets or prisms.

C. S.

Some Ethers of Cholesterol. WILHELM STEINKOPF and ERWIN LINDENMEYER (J. pr. Chem., 1911, [ii], 84, 460—472).—When heated with ethyl iodide, the potassium derivative of cholesterol yields ethylene and cholesterol; with cholesteryl chloride it forms cholesterol and cholesterylene (compare Lindenmeyer, J. pr. Chem., 1863, [i], 1, 321).

By heating cholesteryl chloride with zinc dust or zinc oxide, Kautner and Suida (Abstr., 1896, i, 425) obtained a substance which they considered to be cholesteryl ether. The authors have repeated these experiments, and find that the product consists of cholesterylene together with a small quantity of a substance, m. p. 9—225°.

Cholesteryl phenyl ether, $C_{27}H_{45}OPh$, obtained by heating cholesteryl chloride with sodium phenoxide, crystallises in lustrous, silvery leaflets, m. p. 157.5°, and has, in chloroform solution, $[\alpha]_D - 34.89^\circ$; the **ethyl ether**, prepared in a similar manner, has m. p. 154.5°, $[\alpha]_D - 32.95^\circ$ in chloroform solution. The benzyl ether, obtained by heating the potassium derivative of cholesterol with benzyl chloride at 100°, forms small, white needles, m. p. 118.5°, $[\alpha]_D - 26.02^\circ$ (compare preceding extract).

Cholesteryl p-methylbenzyl ether, $C_{27}H_{45}OCH_2C_6H_4Me$, prepared from p-bromo-p-xylene in a similar manner, exists in several solid and liquid crystalline modifications. It melts at 129—130° to a turbid, opalescent liquid, which becomes clear at 141.5°; on cooling, the liquid again becomes turbid, and acquires a deep violet colour, which then passes successively into blue, green, red, and pink, solidification finally taking place at 130°; in chloroform solution it has $[\alpha]_D - 26.32^\circ$. The m-methylbenzyl ether melts at 93—94° to a turbid

liquid, which becomes isotropic at 125° , and shows the same colour changes as the preceding compound; in chloroform solution n_D^{20} is 1.4625 , $[\alpha]_D^{20} = 31.76^{\circ}$. A microcrystallographic examination of the two last mentioned ethers is given by Lehmann.

1-Phytosterols. II. TIMOTHÉE KLOBB (*Ann. Chim. Phys.*, 1911, [viii], 24, 410—421. Compare Abstr., 1910, i, 31; ii, 1100, 1911 i, 199).—The phytosterols of *Matricaria chamomilla*, *Tilia europaea*, *Linaria vulgaris*, and *Verbascum thapsus* are described.

The oily matter left after the deposition of hydrocarbon by the acetone extract of *Matricaria chamomilla* (Abstr., 1910, ii, 1165), on treatment with potassium hydroxide in alcohol yields a small amount of unsaponifiable matter, which after solution in hot alcohol deposits a mixture (m. p. $120-131^{\circ}$, $n_D^{20} = 29.3^{\circ}$) of needles and hexagonal lamellae. This mixture gives the colour reactions of the 1-phytosterols, and in addition a purple coloration with sulphuric acid containing nitrous acid. Acetic anhydride converts it into a mixture of acetyl derivatives, m. p. $150-175^{\circ}$, crystallising as lamellae and flattened prisms. The mixture on bromination separates into a substance, $C_{26}H_{42}OAc, Br$, m. p. $158-160^{\circ}$, crystallising as hexagonal lamellae, and a product, $C_{26}H_{40}OAc, Br$, m. p. $115-116^{\circ}$, which crystallises from benzene, on addition of alcohol, in microscopic granules.

[With J. GARNIER, in part.]—The unsaponifiable matter from the flowers of *Tilia europaea* contains a phytosterol, $C_{26}H_{44}O$, $n_D^{20} = 29.7^{\circ}$, m. p. 126° , crystallising in hexagonal lamellae, and giving certain colour reactions; the benzoyl derivative, m. p. 140° , and the acetyl derivative, m. p. $118-119^{\circ}$, crystallise in hexagonal lamellae. The second of these gives a dibromo-compound, $C_{26}H_{40}OAc, Br$, m. p. $115-120^{\circ}$, which separates from benzene on addition of alcohol as microscopic granules.

The phytosterol, $C_{26}H_{44}O$, obtained from *Linaria vulgaris* (Abstr., 1907, ii, 123), gives a benzoyl derivative, $n_D^{20} = 14.55^{\circ}$, m. p. 147° , crystallising in nacreous, rectangular lamellae, and an acetyl derivative, $n_D^{20} = 38.61^{\circ}$, m. p. $117-130^{\circ}$, which crystallises simultaneously as hexagonal lamellae and short prisms, and may be a mixture.

[With R. EHREWEIN.]—The flowers of *Verbascum thapsus* treated by the general process (Abstr., 1910, ii, 1100) furnish *verbasterol*, $n_D^{20} = 33^{\circ}$, m. p. $142-144^{\circ}$, containing carbon 82.05% and hydrogen 11.89%, and crystallising in pearly, hexagonal lamellae. On treatment with acetic anhydride two substances are formed; the one has m. p. $169-171^{\circ}$, and the other, m. p. $108-110^{\circ}$. It is impossible at present to say whether in this and the previous case the two acetyl derivatives are isomerides derived from the same phytosterol, or whether the original substance is a mixture and is resolved into its components by acetylation.

T. A. H.

3:4-Dihydroxybenzyl-methyl and -dimethyl Amines. MAX TIEFFENHAU (*Bull. Soc. chim.*, 1911, [iv], 9, 928—932).—These two bases, which are closely related to adrenaline and exhibit a similar but far weaker physiological action, are described.

3:4-Dimethoxybenzyl alcohol (*veratryl alcohol*), D¹⁶ 1-180, b. p. 169°/13 mm., obtained by the action of potassium hydroxide on veratraldehyde, is a viscous liquid; the *acetate*, b. p. 170—175°/13 mm., is a thick liquid; the *benzoate*, D¹⁶ 1-203, m. p. 36—37°, b. p. 233—256°/12 mm., crystallizes on long keeping; the *phenylurethane*, m. p. 118°, is crystalline.

3:4-Dimethoxybenzyl chloride, m. p. 48°, is crystalline, and when heated with methylamine in a closed tube furnishes 3:4-dimethoxybenzyl dimethylamine, b. p. 135—140°/12 mm., the *hydriodide* of which has m. p. 170—171°. On demethylation, the base yields 3:4-dihydroxybenzyl dimethylamine, m. p. 179°, the *hydrochloride* of which has m. p. 182°.

When heated with dimethylamine in a closed tube, or when treated with this substance in dilute ethereal solution, 3:4-dimethoxybenzyl chloride yields 3:4-dimethoxybenzyl dimethylamine, D¹⁶ 1-0578, b. p. 132—137°/12 mm., or 236—239°/760 mm., as a colourless liquid. This gives a *hydriodide*, m. p. 174°, a *methiodide*, m. p. 179°, and with acid anhydrides or chlorides furnishes the corresponding acyldimethylamines and dimethoxybenzyl esters. On demethylation of the parent base, 3:4-dihydroxybenzyl dimethylamine is obtained, yielding a *hydrochloride*, m. p. 183°, which may also be prepared by the action of phosphorus pentachloride on 3:4-methylenedioxybenzyl dimethylamine, D¹⁶ 1-101, h. p. 125°/13 mm. The latter was obtained by heating piperonyl chloride (Decker and Koch, Abstr., 1905, i, 473) with dimethylamine in a closed tube. The *hydrochloride* has m. p. 233°, the *hydriodide*, m. p. 135°, and the *methiodide*, m. p. 233°.

Piperonyl alcohol furnishes an *acetate*, m. p. 18°, and a phenylurethane, m. p. 102-5°.

T. A. II.

2:3 and 3:4-Dihydroxybenzylamines. RENÉ DOUETTEAU (Bull. Soc. chim., 1911, [iv], 9, 932—938. Compare preceding abstract).—These substances were prepared with a view to comparing their physiological action with that of adrenaline.

2:3-Dimethoxybenzylamine, D¹⁶ 1-1243, b. p. 137°/11 mm., obtained by reduction of 2:3-dimethoxybenzaldehyde (Noelting, Abstr., 1910, i, 176), is a colourless, oily liquid; the *hydrochloride*, m. p. 159°, is crystalline; the *picrate*, m. p. 205°, forms golden-yellow needles; the *methiodide* has m. p. 174°; the *acetyl* derivative, m. p. 94°, b. p. 110—211°/10 mm., is crystalline, and when treated with sodium in boiling benzene and then submitted to the action of methyl iodide furnishes 2:3-dimethoxyphenylacetomethylamide,

D¹⁶ 1-1506, b. p. 202—205°/13 mm. (approx.), as a pale yellow, viscous liquid. When heated with acetic anhydride at 150—160° this decomposes, furnishing the initial amide (compare Tiffeneau, this vol., i, 778).

2:3-Dihydroxybenzylamine *hydriodide*, m. p. 149°, obtained by the action of hydriodic acid on the dimethyl ether referred to above, is crystalline, and on treatment with silver chloride yields the *hydrochloride*, m. p. 186°; both salts give a green coloration with ferric chloride.

3:4-Dimethoxybenzylamine, b. p. 154—158°/12 mm. (apparently prepared like its isomeride, is a colourless oil; the hydrochloride, m. p. 257°, the picrate, m. p. 169°, and the methiodide, m. p. 239°, were obtained crystalline. On demethylation by hydriodic acid, 3:4-dihydroxybenzylamine hydroiodide, m. p. 205°, is produced, from which the hydrochloride, m. p. 172°, is obtained by agitation with silver chloride.

T. A. H.

1-Aminocyclopentane-1-carboxylic Acid. NICOLAI D. ZELINSKI and G. STADNIKOFF (*Zeitsch. physiol. Chem.*, 1911, 75, 356—358). Compare Abstr., 1906, i, 425).—1-Aminocyclopentane-1-carboxylic acid has been obtained by the interaction of cyclopentanone, ammonium chloride, and potassium cyanide in aqueous alcoholic solution, and subsequent hydrolysis of the nitrile so formed by means of hydrochloric acid. It separates from water in monoclinic crystals containing $1\frac{1}{2}H_2O$, decomp. 320°. The copper salt was analysed.

H. W.

Naphthenic Acids. I. PETROFF (*J. Russ. Phys. Chem. Soc.*, 1911, 43, 1198—1201).—Crude naphthenic acid from Baku naphtha was carefully purified from neutral substances and then converted into methyl esters, of which the three following were isolated: (1) b. p. 161—163°/748 mm.; the acid from this has b. p. 211—213°, which corresponds with that of Markownikoff's heptanaphthenic acid (Abstr., 1893, i, 93); (2) b. p. 169—171°/748 mm., the acid from which has b. p. 218—220°, corresponding with that of Colman and Perkin's 1-methylpentamethylene-2-carboxylate (*Trans.*, 1888, 53, 185), and (3) $C_7H_{16}\cdot CO_2Me$, h. p. 177—178°/736 mm., D_4^{20} 0.9455, D_4^{25} 0.9295, n_D^{20} 1.43005.

Reduction of ester (3) by Bouveault and Blanc's method (Abstr., 1903, i, 597) yields the alcohol, $C_6H_{12}\cdot OH$, as a colourless, viscous liquid with a pleasant odour, b. p. 183—184°/756 mm., or 103—104°/35 mm., D_4^{20} 0.8943, D_4^{25} 0.8808, n_D^{20} 1.44541.

The alcohol was converted through the xanthate into the naphthylene, b. p. about 108°, which contained an admixture of toluene, and hence was not analysed.

When the ester (3) was heated in a sealed tube with concentrated ammonia solution at 150°, it was converted into a mixture of two amides, which after several fractional crystallisations showed m. p. 117° and 160° respectively, but it is possible that the separation was not complete; it is probable that these two amides are *cis*- and *trans*-isomerides. Two other fractions, b. p. 192° and 200°, were also separated, and are being investigated.

T. H. P.

o-Amino-*p*-sulphobenzoic Acid and its Derivatives, with Special Reference to their Fluorescence. II. JOSEPH H. KASTNER and R. L. HADEN (*Amer. Chem. J.*, 1911, 46, 508—518).—It has been shown in an earlier paper (this vol., i, 200) that when disilver *o*-amino-*p*-sulphobenzoate is treated with ethyl iodide, *o*-ethylamino-*p*-sulphobenzoic acid is produced. In one experiment, a small quantity of a sulphur-yellow compound was obtained, which has now been found to be diethyl *o*-ethylamino-*p*-sulphobenzoate,

p. 151—153° (uncorr.); it crystallises in yellow needles, and on hydrolysis is converted into *o*-ethylamino-*p*-sulphobenzoic acid.

When *o*-amino-*p*-sulphobenzoic acid (1 mol.) is heated with its silver salt (1 mol.), an acid silver salt,

$\text{C}_6\text{H}_3(\text{NH}_2)\cdot\text{SO}_3\text{H}\cdot\text{CO}_2\text{Ag}\cdot\text{C}_2\text{H}_5(\text{NH}_2)\cdot\text{SO}_3\text{Ag}\cdot 2\text{H}_2\text{O}$, is formed, which on being treated with ethyl iodide is converted into a mixture of diethyl *o*-ethylamino-*p*-sulphobenzoate and the original amino-acid.

Comparison has been made of the fluorescence in various solvents of *o*-amino-*p*-sulphobenzoic acid, *o*-ethylamino-*p*-sulphobenzoic acid, and the diethyl ester of the latter. The substitution of an ethyl group for a hydrogen atom of the carboxyl or amino-group has the effect of increasing the blue tint of the fluorescence; thus, in a mixture of equal volumes of water and alcohol, *o*-amino-*p*-sulphobenzoic acid shows a pinkish-purple fluorescence, and the ethylamino-acid a pure blue, whilst the diethyl ester of the latter gives a yellow solution with a pure blue fluorescence.

o-Aminoterephthalic acid exhibits a reddish-blue fluorescence in dilute aqueous and alkaline solutions, and a pure blue fluorescence in acetone solutions. Aqueous solutions of the mono- and di-ethyl esters show a pure blue fluorescence.

E. G.

Isomerism of the Three *allo*-Cinnamic Acids. JULIUS MEYER (*Ber.*, 1911, 44, 2966—2970).—Evidence is adduced in support of Billmann's (*Abstr.*, 1909, i, 155, 382; 1910, i, 346) view of the relationship of the three acids as opposed to Stobbe's explanation of their isomerism (this vol., i, 859).

Billmann's observation that any one of the three acids may be obtained by inoculating the melted substance with the required acid is confirmed (*Abstr.*, 1909, i, 155) and extended by the observation that a supersaturated solution behaves similarly. A spontaneously crystallised fusion of one form can be converted into a second form by inoculation, and the rate of this transformation descends in the following order, $42^\circ \rightarrow 68^\circ > 42^\circ \rightarrow 58^\circ > 58^\circ \rightarrow 68^\circ$. The velocity of crystallisation is greatest for the 68° acid and least for the 42° acid. The heat developed in the change of one form into either of the other two is too small to be measured. The spontaneously crystallised fusion may consist of all three acids, and no difference in behaviour could be observed whichever form was melted in the first instance. Solutions of all three acids at the same concentration and temperature have the same electrical conductivity (compare Billmann, *Abstr.*, 1910, i, 346), but the solubility in water is least for the 68° acid and greatest for the 42° acid. All these observations are in harmony with Billmann's view that the *allo*-cinnamic acids are polymorphous modifications of *cis*-cinnamic acid.

T. A. H.

Transformations of *cis*-Cinnamic Acid. HUGO R. KRUYT (*Ber.*, 1911, 44, 3108—3115. Compare Stobbe, this vol., i, 859). To explain Stobbe's results (*loc. cit.*), Tamman's theory of the mechanism of spontaneous crystallisation must be extended to the equilibrium solid-solid. The maximum rate of crystallisation occurs at a much higher temperature than that of the formation of crystalline nuclei. When a

liquid is undercooled and warmed again slightly, no crystallization takes place at the lower temperature, but it sets in rapidly on warming, owing to the marked formation of nuclei at the lower temperature. Stobbe's results are criticised in detail, and shown to be fully in agreement with this hypothesis.

E. F. A.

Compounds of 3:5-Dinitro-4-hydroxybenzoic Acid with Hydrocarbons. II. OTTO MORGENSTERN (*Monatsh.*, 1911, 32, 711-714. Compare Abstr., 1910, i, 482).—It is sought by physical chemical measurements to establish the composition of the coloured compounds of 3:5-dinitro-4-hydroxybenzoic acid with aromatic hydrocarbons previously described (Abstr., 1910, i, 482). Measurements have been made of the equilibrium between hydrocarbon and acid in alcoholic solution.

If two molecules of acid combine with one of hydrocarbon $(c_1^2/c_2) = a$ constant, c_1 , c_2 , and c_3 being the concentrations of free and free hydrocarbon, and of the compound of the two respectively.

The values of c_1 , c_2 , and c_3 were determined experimentally in two ways. In the first a small proportion of hydrocarbon was added to the saturated solution of acid; in the second a little acid was added to the saturated hydrocarbon solution. The results show that in the second series the expression $(c_1^2/c_2)/c_3$ was not a constant, but that equilibrium was obtained between an equal number of molecules of acid and hydrocarbon, or, in other words, $(c_1 c_2)/c_3 = a$ constant. The first series in which acid was in excess pointed to the formation of a compound 2 acid + hydrocarbon as assumed.

Two series of compounds are thus proved to exist in the case of phenanthrene, retene, and fluorene with dinitrohydroxybenzoic acid.

The compound acid + phenanthrene crystallises in yellow needles, m. p. 180° (decomp.).

The compound acid + fluorene is a yellowish-white powder, m. p. 210—214° (decomp.).

The analogous retene compound forms yellow plates, m. p. 226° (decomp.).

E. F. A.

Studies on Tautomerism. V. Enolic Forms of Methyl Benzoylacetate and Acetylacetone. LUDWIG KNORR (*Ber.*, 1911, 44, 2767—2772. Compare Meyer, this vol., i, 833).—The enolic forms of methyl benzoylacetate and acetylacetone can be isolated by the methods previously given in the case of ethyl acetoacetate (this vol., i, 516), with the difference that in these cases the enolic and not the ketone forms crystallise out on strongly cooling solutions of the equilibrium mixtures. Methyl benzoylacetate when dissolved in a mixture of ether and light petroleum deposits at -78° acicular crystals, which can be collected, washed, and dried in the apparatus previously described. The freshly prepared substance has m. p. about 40° (bath previously heated), and gives an intense coloration with alcoholic ferric chloride solution. It has n_D^{25} 1.5620, whilst the equilibrium mixture has n_D^{25} 1.5418. These properties indicate that it is the enolic form of the ester, and, in fact, the same substance is obtained (but it is not

pare) by treating an aqueous solution of the pure sodium salt (see below) with the calculated quantity of normal sulphuric acid at 0°.

The production of the ketonic form takes place fairly rapidly. The crystals liquefy gradually even in a desiccator, and the oil attains the refractive index of the equilibrium mixture in the course of hours or days according to the nature of the containing vessel.

The sodium and iron salts of the enolic ester were also prepared. The sodium salt, $C_{10}H_9O_2Na$, is obtained in small laminae by mixing at 0° a methyl-alcoholic solution of sodium methoxide with the equivalent quantity of the ester dissolved in ether. The sodium salt of ethyl benzoylacetate, $C_{11}H_{11}O_2Na$, is similarly prepared. The ferric salt of ethyl benzoylacetate, $Fe(C_{10}H_9O_2)_3$, is prepared by mixing at 0° a methyl-alcoholic solution of the ester with an ethereal solution of ferric chloride, and the salt is washed with water until the chlorine reaction disappears. After recrystallisation, it forms red needles, m. p. 185° (previously sintering). From the reaction in dilute ethereal solution of molecular quantities of ferric chloride and the ester, an iron salt containing chlorine is obtained. It forms compact, yellow, hygroscopic crystals, which on analysis yield numbers corresponding fairly well with the formula $FeCl_2(C_{10}H_9O_2)_3 \cdot 3H_2O$. It dissolves in water and alcohol, with production of the deep reddish-violet coloration characteristic of the iron reaction.

[With HERMANN FISCHER.]—The enolic form of acetylacetone has been isolated by strongly cooling solutions of the equilibrium mixture. The crystalline substance has m. p. -2°, n_D^{20} 1.4609. At the ordinary temperature the substance rapidly changes into the atropic mixture of diketone and enol ketone (n_D^{20} 1.4550); at 15° the transformation is complete in twenty minutes. By withdrawal of the enolic isomeride with copper hydroxide, preparations containing much of the ketonic form have also been obtained.

R. V. S.

General Additive Reaction between Alkylidene-urethanes and β Dicarboxylic Compounds. G. BIANCHI and ROBERT SCHIFF (*Gazzetta*, 1911, 41, ii, 81—93).—When a concentrated alcoholic solution of equimolecular quantities of ethyl acetoacetate and urethane are treated with a corresponding quantity of benzaldehyde and a few drops of concentrated hydrochloric acid, the mixture becomes solid in a few minutes (formation of benzylidenediurethane), then liquefies, and finally solidifies two days later. The substance produced (compare Schiff and Bertini, *Abstr.*, 1897, i, 493) is the additive product, ethyl urethanobenzylacetoacetate, $CO_2Et \cdot CHAc \cdot CHPh \cdot NH \cdot CO_2Et$, which is a white, microcrystalline powder, m. p. 96—97°. When slightly warmed with concentrated sulphuric acid, it gives a red coloration. The analogous compounds described were similarly prepared, and the reaction appears to be a general one.

Ethyl urethanobenzylbenzoylacetate,

is a white, minutely crystalline powder, m. p. 97°.

Ethyl urethanobenzylacetylacetone, $CHAc_2 \cdot CHPh \cdot NH \cdot CO_2Et$, forms a white, crystalline powder, m. p. 101°; its alcoholic solution gives a red coloration with ferric chloride when warmed.

Ethyl urethanocinnamylacetate,
 $\text{CHPh}\cdot\text{CH}\cdot\text{CH}(\text{NH}\cdot\text{CO}_2\text{Et})\cdot\text{CHAc}\cdot\text{CO}_2\text{Et}$,
 is a white, microcrystalline powder, m. p. 92—93°.

Urethanocinnamylacetylacetone, $\text{CHPh}\cdot\text{CH}\cdot\text{CH}(\text{CHAc})\cdot\text{NH}\cdot\text{CO}_2\text{Et}$,
 is a white, microcrystalline powder, m. p. 107°, and gives an intense
 red coloration with ferric chloride.

Urethanocinnamylacetylacetone, $\text{OMe}\cdot\text{C}_6\text{H}_4\cdot\text{CH}(\text{CHAc})\cdot\text{NH}\cdot\text{CO}_2\text{Et}$, is
 a white, crystalline powder, m. p. 98°; with ferric chloride it gives
 an intense red coloration.

Urethanosalicylacetylacetone, $\text{OH}\cdot\text{C}_6\text{H}_4\cdot\text{CH}(\text{CHAc})\cdot\text{NH}\cdot\text{CO}_2\text{Et}$, is a
 white, crystalline powder, m. p. 128—130°, and gives a red coloration
 with ferric chloride.

All the compounds described are very stable towards mineral
 acids.

R. V. A.

Preparation of Unsymmetrical Substituted Diphenylmethane Derivatives. ANILINFARBEN- & EXTRAKT-FABRIKEN, WAG.
 JOH. RUD. GMBH (D.R.-P. 236046).—When 2-hydroxy-*m*-toluic acid
 is treated with chloromethyl alcohol (or analogous reagents) in the
 presence of fuming hydrogen chloride, condensation takes place in the
 para-position to the hydroxyl group.

2-Hydroxy-3-methyl-5-chloromethylbenzoic acid (annexed formula) is a
 colourless, crystalline powder, m. p. 197°; when heated with water it
 furnishes, in part, *2-hydroxy-3-methyl-5-hydroxy-3-methylbenzoic acid*, $\text{CO}_2\text{H}\cdot\text{C}_6\text{H}_2\text{Me}(\text{OH})\cdot\text{CH}_2\text{OH}$,
 hard prisms, m. p. 186°; in part, the anhydro-
 compound an amorphous, colourless, insoluble,
 infusible powder.

2-Hydroxy-5-diethylaminobenzyl-3-methylbenzoic acid is prepared by heating 2-hydroxy-3-methyl-5-chloromethylbenzoic
 acid with diethylaniline, first at 70°, and subsequently at 140°, the
 sodium salt forms glistening leaflets, and the free acid crystallizes in
 tablets, m. p. 171°.

2-Hydroxy-5-ethylaminotolylmethyl-3-methylbenzoic acid, glistening
 prisms, m. p. 184°, is prepared from 2-hydroxy-3-methyl-5-hydroxy-
 methylbenzoic acid (or its anhydro-compound) and ethyl-*o*-toluidine
 in the presence of hydrogen chloride at 110—120°; the sodium salt
 forms glistening leaflets.

2-Hydroxy-5-methylaminobenzyl-3-methylbenzoic acid, leaflets, m. p.
 193°; *2-hydroxy-5-dimethylaminobenzyl-3-methylbenzoic acid*, glistening
 silvery scales, m. p. 195°; *2-hydroxy-5-dimethylaminotolylmethyl-3-*
methylbenzoic acid, glistening, pearly leaflets, m. p. 167°; *2-hydroxy-5-*
diethylaminochlorobenzyl-3-methylbenzoic acid, prisms, m. p. 152°; and
2-hydroxy-5-diethylaminodichlorobenzyl-3-methylbenzoic acid, needles,
 m. p. 230°, were also prepared.

F. M. G. M.

Action of Sodium Amalgam on Naphtholcarboxylic Acids
 HUGO WEIL (Ber., 1911, 44, 3058—3062).—When reduced with
 sodium amalgam in aqueous solution in the presence of boric acid as

sodium hydrogen sulphite, α -naphthol-2-carboxylic acid yields 1-hydroxy-2-naphthaldehyde (Beadrik and Friedländer, Abstr., 1909, i, 416).

β -Naphthol-3-carboxylic acid is reduced, under similar conditions, to tetrahydronaphthaldehyde, and β -naphthoic acid to β -naphthaldehyde, whilst α -naphthoic acid remains unchanged.

[With Walter HERRDT.]—4-Sulphoxyl- α -naphthol-2-carboxylic acid is converted into 1-hydroxy-2-naphthaldehyde, the sulphoxyl group being eliminated during the reduction.

4-Bromo- α -naphthol-2-carboxylic acid, obtained by brominating α -naphthol-2-carboxylic acid in glacial acetic acid solution (compare Schmitt and Burkhard, Abstr., 1888, 59), is reduced by sodium amalgam to 4-bromo-1-hydroxy-2-naphthaldehyde. This crystallises in yellow needles, m. p. 112°, yields a phenylhydrazone, m. p. 159°, and condenses with primary aromatic amines, yielding anils; the compound, $C_{17}H_{11}ONBr$, obtained from aniline, forms orange-yellow needles, m. p. 161°; the compound, $C_{18}H_{14}ONBr$, formed by condensation with *o*- and *p*-toluidine crystallise in yellowish-red needles, m. p. 188° and 171° respectively; the compound from α -naphthylamine has m. p. 196°.

4-Chloro- α -naphthol-2-carboxylic acid, $C_{17}H_{11}O_3Cl$, prepared by chlorinating α -naphthol-2-carboxylic acid in glacial acetic acid solution, has m. p. 228°. It is reduced by sodium amalgam to 4-chloro-1-hydroxy-2-naphthaldehyde, which crystallises in yellow needles, m. p. 103°, and yields an oxime, m. p. 194°, and a phenylhydrazone, m. p. 153°; the acene, $C_{22}H_{14}O_3N_2Cl$, forms yellow needles, m. p. 179°. The aldehyde yields a sodium salt, crystallising in yellow leaflets, and condenses with aniline, yielding the anil, $C_{17}H_{12}ONCl$, which crystallises in yellow needles, m. p. 157°; with α -naphthylamine it forms the compound, $C_{21}H_{14}ONCl$, reddish-yellow leaflets, m. p. 183°; the compound, $C_{18}H_{14}ONCl$, obtained by condensation with *o*- and *p*-toluidine are orange-yellow, and have m. p. 183° and 164° respectively.

F. B.

Addition of Hydrogen Bromide to Cinnamylidenemalonie Acid, Cinnamylideneacetic Acid, and Phenylbutadiene. C. N. RIEBE (Ber., 1911, 44, 2974—2978).—The addition of hydrogen bromide (1 mol.) to methyl cinnamylidenemalonate (compare Hinrichsen, Abstr., 1904, i, 1012) and to methyl cinnamylideneacetate in the $\alpha\beta$ position (contrary to the predictions of Thiele's theory) has been proved as follows. Etheral solutions of the respective esters are treated with hydrogen bromide; the solution of the additive compound is treated with magnesium and subsequently with water, the resulting product being finally oxidised by potassium permanganate. In both cases benzoic and succinic acids are obtained. The reaction between α -phenyl- Δ^2 -butadiene and etheral hydrogen bromide yields, in addition to a small quantity of a crystalline substance, $C_{10}H_9Br_2 \cdot 2HBr$, m. p. 146°, an unstable oil, $CHPh:CH:CHBrMe$, which reacts with etheral zinc methyl at 100° to form a hydrocarbon, $C_{11}H_{10}$, b. p. 84–86°/13 mm., from which benzoic and isobutyric acids are obtained by oxidation with potassium permanganate.

C. S.

[Preparation of Derivatives of Anthraquinonecarboxylic Acids and of Anthraquinoneacridones.] BADISCHE ANILIN- & SODA-FABRIK (D.R.-P. 237236 and 237237).—Condensation products of chloro- and amino-anthraquinones have previously been described; it is now found that similar condensations take place with halogen- or nitro-anthraquinonecarboxylic acids (or bases) in the presence of condensing agents, such as aluminium chloride, sulphuric acid, or copper.

1-Anilinoanthraquinone-2-carboxylic acid is prepared by heating 1-nitro- or 1-chloro-anthraquinone-2-carboxylic acid with aniline at 120—130° in the presence of copper powder and anhydrous sodium acetate; it forms glistening, brown leaflets, m. p. 297—298°; the sodium salt, glistening, violet-black needles, gives a deep violet solution in water, and when heated at 59—60° with phosphorus pentachloride in benzene solution with aluminium chloride furnishes an anthraquinoneacridone as a violet-red powder.

p-Toluidino-1-anthraquinone-2-carboxylic acid, a violet powder, is similarly obtained with p-toluidine.

4-Chloro-1-anilinoanthraquinone-2-carboxylic acid, a carmine-red powder, is furnished by the employment of p-chloroaniline.

1-Naphthylamino-1-anthraquinone-2-carboxylic acid is a violet powder, and the product from 1-chloroanthraquinone-2-carboxylic acid (2 mol.) and 4:4'-diaminodiphenylmethane (1 mol.), a violet-red powder, all of which furnish the corresponding anthraquinoneacridone on treatment with phosphorus pentachloride.

The colours of the solutions given by these substances in various solvents and other tinctorial properties are described in the original.

The second patent describes the preparation of 1-anilinoanthraquinone-2-carboxyl chloride, glistening, reddish-brown leaflets, by the action of phosphorus pentachloride on a benzene solution of the foregoing acid at 50—60°; this, by heating at 200° with trichlorobenzene until the evolution of hydrogen chloride ceases, yields the anthraquinoneacridone in violet-red needles.

1-Naphthylaminoanthraquinone-2-carboxyl chloride, a reddish-brown powder, is obtained by treating the corresponding acid with thionyl chloride, and on boiling with xylene furnishes the anthraquinoneacridone.

F. M. G. M.

Oxidation of Phthalacene. D. MAROTTA (*Gazzetta*, 1911, 41, n. 59—63).—The oxidation of the methyl group of phthalacene (compare Errera, Abstr., 1908, i, 183) can be effected by means of nitric acid

and 3:4:5:6-dibenzoylenebenzoic acid, $\text{C}_6\text{H}_4 \cdot \text{C} \begin{array}{c} \text{C}_6\text{H}_5 \\ | \\ \text{CO} \end{array} \text{C} \begin{array}{c} \text{C}_6\text{H}_5 \\ | \\ \text{CO} \end{array} \text{C}(\text{CO}_2\text{H}) \cdot \text{CH} \begin{array}{c} \text{C}_6\text{H}_5 \\ | \\ \text{CO} \end{array} \text{C}_6\text{H}_4$

is produced. From this, on reduction, 3:4:5:6-dibenzoylenebenzoic acid, $\text{C}_6\text{H}_4 \cdot \text{C} \begin{array}{c} \text{C}_6\text{H}_5 \\ | \\ \text{CH}_2 \end{array} \text{C} \begin{array}{c} \text{C}_6\text{H}_5 \\ | \\ \text{CH}_2 \end{array} \text{C}(\text{CO}_2\text{H}) \cdot \text{CH} \begin{array}{c} \text{C}_6\text{H}_5 \\ | \\ \text{CH}_2 \end{array} \text{C}_6\text{H}_4$, is obtained. 3:4:5:6-Dibenzoyl

enobenzoic acid is prepared by heating phthalacene with dilute nitric acid (D 1.035) in a sealed tube for five hours at 200°. In this way nitration is avoided, but the reaction must be completed by opening the tube, decanting the liquid, adding more acid, and then re-heating

at 300° for five hours. The substance is an orange-red powder, m. p. 300°. The potassium salt, $C_{11}H_5O_4K \cdot 3H_2O$, can be prepared, and is very readily hydrolysable. From it the silver salt is obtained, and from this the ethyl ester, $C_{10}H_5O_4 \cdot CO_2Et$, which forms silky, yellow needles, m. p. 130°.

3:4:5:6-Dibenzylbenzoic acid is obtained by heating the above acid with hydriodic acid and phosphorus in a sealed tube for five hours at 200°; it forms minute, pale yellow needles, m. p. above 300°. The alkali salts can be hardly isolated on account of their hydrolysability. From the silver salt the ethyl ester (brown crystals, m. p. 136.—137°) was prepared.

R. V. S.

Derivatives of Phthalic Acid Containing Sulphur and Nitrogen. ARNOLD REISSERT and HERMANN HOLLE (*Ber.*, 1911, **44**, 3027—3040).—Thiophthalic anhydride, $C_6H_4 \begin{smallmatrix} \diagup CO \\ \diagdown CO \end{smallmatrix} S$, m. p. 114°, is

conveniently prepared by triturating phthalic anhydride and crystallised sodium sulphide in a mortar, adding water, and pouring the mixture into dilute hydrochloric acid; the product is freed from phthalic acid by repeated extraction with aqueous sodium carbonate. It is converted into phthalide by reduction with 8% sodium amalgam.

Ethyl thiophthalate, $CO_2Et \cdot C_6H_4 \cdot CO \cdot SEt$, b. p. about 194°/10 mm., is obtained by treating thiophthalic anhydride with cold alcoholic sodium ethoxide, and adding ethyl iodide. In a similar manner the isomeric esters, $CO_2R \cdot C_6H_4 \cdot CO \cdot SR'$ and $(CO_2R' \cdot C_6H_4 \cdot CO \cdot SR)$, have been prepared; thus (S)-methyl ethyl thiophthalate, $CO_2Et \cdot C_6H_4 \cdot CO \cdot SMe$,

b. p. 209°/16 mm., D 1-1923, is obtained by adding methyl iodide to thiophthalic anhydride in alcoholic sodium ethoxide, and yields phthalic acid, ethyl alcohol, and methyl mercaptan by hydrolysis, whilst methyl (S)-ethyl thiophthalate, $CO_2Me \cdot C_6H_4 \cdot CO \cdot SEt$, b. p. 209°/16 mm., D 1-1906, is prepared by adding ethyl iodide to the anhydride in methyl-alcoholic sodium methoxide, and yields phthalic acid, methyl alcohol, and ethyl mercaptan by hydrolysis. When chloro-2:4-dinitrobenzene in methyl alcohol is added to a cold methyl-alcoholic solution of sodium methoxide and thiophthalic anhydride, and the mixture is subsequently boiled, tetranitrodiphenyl sulphide and (S)-2:4-dinitrophenyl methyl thiophthalate, $CO_2Me \cdot C_6H_4 \cdot CO \cdot S \cdot C_6H_3(NO_2)_2$, m. p. 121°, yellow prisms, are obtained. Methyl dithiophthalate, $C_6H_4(CO \cdot SMe)_2$, m. p. 124°, yellowish-brown leaflets or needles, is obtained by the addition of methyl sulphate to the liquid produced by the trituration of thiophthalic anhydride and crystallised sodium sulphide.

Thiophthalanil, $C_6H_4 \begin{smallmatrix} \diagup CO \\ \diagdown CS \end{smallmatrix} NPh$, m. p. about 144°, long, red needles, is obtained in 80% yield by heating phthalanil and phosphorus pentasulphide in boiling xylene containing a little aniline as a sulphur-carrier, and is purified best by conversion into thiophthalanilic acid by alcoholic sodium hydroxide, the acid being reconverted into the anhydride by boiling with water. The hydrolysis of thiophthalanil by N-sodium hydroxide and alcohol, and the subsequent oxidation of the product by potassium ferricyanide, yields benzthiazole-1-o-benzoic acid,

$\text{CO}_2\text{H}\cdot\text{C}_6\text{H}_4\cdot\text{C}\begin{smallmatrix} \text{S} \\ \diagup \diagdown \\ \text{N} \end{smallmatrix}\text{C}_6\text{H}_4$, m. p. 189° , the methyl ester of which has m. p. 73° ; the hydrochloride, $\text{C}_{14}\text{H}_9\text{O}_2\text{NS}\cdot\text{HCl}$, and the copper and calcium salts are described, the latter yielding 1-phenylbeuzthiazide by distillation.

Iminophthalanil, $\text{C}_6\text{H}_4\cdot\text{C}\begin{smallmatrix} \text{CO} \\ \diagup \diagdown \\ \text{C}(\text{NH}) \end{smallmatrix}\text{NPh}$, m. p. 170° , yellow needles, obtained from thiophthalanil and carbamide at $140\text{--}150^\circ$, dissolves in alkalis and in dilute acids, and yields *methyliminophthalanil*, $\text{C}_6\text{H}_4\cdot\text{C}\begin{smallmatrix} \text{CO} \\ \diagup \diagdown \\ \text{C}(\text{NMe}) \end{smallmatrix}\text{NPh}$, m. p. 145° , with methyl sulphate in alkaline solutions, and *benzyliminophthalanil*, m. p. 120° , with benzyl chloride and alcoholic sodium ethoxide. *Oximinophthalanil*,

$\text{C}_6\text{H}_4\cdot\text{C}\begin{smallmatrix} \text{CO} \\ \diagup \diagdown \\ \text{C}(\text{NOH}) \end{smallmatrix}\text{NPh}$, m. p. 246° (decomp.), prepared from thiophthalanil, hydroxylamine sulphate, and sodium carbonate in alcoholic solution, is very stable, and has a strongly acidic, but no basic, character. The bromination of iminophthalanil in chloroform yields *bromiminophthalanil dibromide*, $\text{C}_6\text{H}_4\cdot\text{C}\begin{smallmatrix} \text{CO} \\ \diagup \diagdown \\ \text{C}(\text{NBr}_2) \end{smallmatrix}\text{N}\cdot\text{C}_6\text{H}_4\cdot\text{Br}$, brown needles, which redissolve at 180° , loses bromine, and yields *bromiminophthalanil*, $\text{C}_{14}\text{H}_9\text{ON}_2\text{Br}_2$, m. p. 242° , colourless leaflets. C. S.

Compounds of the Propane Series. II. SIEGMUND GABRIEL (*Ber.*, 1911, 44, 3084—3091. Compare this vol., i, 644).—When heated at 200° and then distilled under diminished pressure, α -phthaliminoisobutyl chloride loses carbon monoxide and hydrogen chloride, yielding β -phthaliminopropylene, $\text{C}_8\text{H}_7\text{O}_2\cdot\text{N}\cdot\text{CMe}\cdot\text{CH}_2$. This crystallises from alcohol in lustrous, hexagonal needles, m. p. $105\text{--}106^\circ$, and is hydrolysed by dilute acids to phthalic acid and acetone. It combines with bromine, forming $\alpha\beta$ -dibromo- β -phthaliminopropene,

$\text{C}_8\text{H}_7\text{O}_2\cdot\text{N}\cdot\text{CMeBr}\cdot\text{CH}_2\text{Br}$, which forms lustrous, glassy needles, m. p. $86\text{--}89^\circ$, and, in the presence of moisture, decomposes into phthalimide and bromoacetone. When heated above its m. p. under diminished pressure, the dibromo compound loses hydrogen bromide and yields a mixture of two isomeric bromo- β -phthaliminopropylenes, $\text{C}_8\text{H}_7\text{O}_2\cdot\text{N}\cdot\text{C}\cdot\text{C}_2\text{H}_3\text{Br}$, of which the one crystallises in leaflets or needles, m. p. $150\text{--}151^\circ$, whilst the other forms flat needles, m. p. $90\text{--}91^\circ$, with previous sintering at 86° . The interaction of bromine and phthaliminoisobutyl bromide (obtained from phthaliminoisobutyric acid and phosphorus pentabromide) yields dibromo- β -phthaliminopropylene, $\text{C}_8\text{H}_7\text{O}_2\cdot\text{N}\cdot\text{C}_2\text{H}_3\text{Br}_2$, which crystallises in lustrous needles, m. p. $169\text{--}170^\circ$; the same compound is obtained by the interaction of bromine and phthaliminoisobutyl chloride.

Tribromo- β -phthaliminopropylene, $\text{C}_8\text{H}_7\text{O}_2\cdot\text{N}\cdot\text{C}_2\text{H}_2\text{Br}_3$, obtained by the action of phosphorus and excess of bromine on phthaliminoisobutyric acid, crystallises in stout needles, resembling gypsum, m. p. $106\text{--}107^\circ$. It is hydrolysed by potassium hydroxide in aqueous alcoholic solution to a dibasic acid, $\text{C}_{11}\text{H}_9\text{O}_5\text{N}$. This crystallises in small needles, which become brown at 135° and decompose at

161–146°; the silver salt, $C_8H_4O_3NaAg \cdot 1\frac{1}{2}H_2O$, and barium salt, $C_8H_4O_3Na_2 \cdot 3H_2O$, are described.

It is suggested that the above-mentioned tribromo-compound has the constitution $C_8H_4O_3 \cdot N \cdot C(CH_2Br)_2 \cdot CHBr$ or $C_8H_4O_3 \cdot N \cdot C(CH_2Br)_2 \cdot CBr_2$, whilst the dibasic acid has probably the formula

When phthaliminocyclopropane (*loc. cit.*) is heated with excess of bromine on the water-bath, it yields a tribromo-derivative, $C_{11}H_6O_3NBr_3$, which crystallises in colourless needles, m. p. 162–163°, with previous melting at 159°, and is isomeric with the above trihalo-8-phthalimitopropylene.

F. B.

Preparation of 2:4-Diaminoisophthalic Acid and Derivatives. MARSTON TAYLOR BOGERT (D.R.P. 236848).—Diacetyl-m-xylylene-4:6-diamine, m. p. 295° (compare Morgan, *Trans.*, 1902, 81, 93), when oxidised with potassium permanganate in the presence of magnesium sulphate yields 4:6-diacetylaminoisophthalic acid, colourless needles, m. p. 276°, which on hydrolysis with concentrated hydrochloric acid furnishes 4:6-diaminoisophthalic acid hydrochloride as yellow needles; the free acid is a colourless powder, m. p. 235° (decomp.); the diacetylanthranil of the acid is crystalline, m. p. 283°, and forms with aniline (2 mols.) a condensation product, colourless needles, m. p. 315°.

F. M. G. M.

Trihydroxybenzoic Acids. FRANZ VON HEMMELMAYR (*Monatsh.*, 1911, 32, 773–791).—The influence of the position of the hydroxyl groups on the entry of bromine, and on the chemical behaviour of the substitution compounds obtained, has been studied in the case of the trihydroxybenzoic acids.

Phloroglucinolcarboxylic acid does not form a substitution compound, but on treatment with bromine, carbon dioxide is eliminated, and ultimately di- or tri-bromophloroglucinol is formed.

Pyrogallolcarboxylic acid forms a monobromo-derivative, which in view of the fact that it can be esterified, is considered to have the annexed constitution. Further treatment with bromine causes the elimination of carbon dioxide and subsequent formation of di- or tri-bromopyrogallol. The former is probably identical with a substance described by Einhorn (*Abstr.*, 1904, i, 238).

The hydroxyquinolcarboxylic acid described by Thiele and Jäger (*Abstr.*, 1901, i, 701) cannot be esterified by alcohol and hydrogen chloride. Accordingly, the annexed constitutional formula is the most probable. Only one bromine atom could be introduced, further action again causing elimination of the carboxylic group and formation of a dibromohydroxyquinol. The monobromo-compound could not be esterified.

The rate of elimination of carbon dioxide on boiling with water has been determined for each of these compounds; in general, the entry of the bromine atom doubles the rate of decomposition.

Dibromophloroglucinol forms colourless, lustrous needles, m. p. 171—172°; it dissolves in sodium carbonate or in ammonia with an orange-yellow coloration. *Dibromophloroglucinyl triacetate* forms colourless needles, m. p. 128—129°.

Monobromopyrogallolcarboxylic acid forms colourless or slightly yellow needles, which on heating sinter, decomp. 230°. The barium salt forms crystalline plates; the methyl ester separates in colourless needles, m. p. 135°. *Dibromopyrogallol* forms bunches of brown needles, which sinter at 160°, decomp. 173°. *Tribromopyrogallol* forms yellowish-brown plates, decomp. 180—186°.

The barium salt of hydroxyquinolcarboxylic acid separates in brown crystals. *Monobromohydroxyquinolcarboxylic acid* forms feather-like groups of needles, decomp. 199°. *Dibromohydroxyquinol* forms large, colourless, prismatic crystals.

Preparation of Tribasic Phenolphthalates. PHILIP A. KOWA and J. THEODORE MARSHALL (*J. Amer. Chem. Soc.*, 1911, 33, 1779—1785).—In an earlier paper (this vol., i, 300), tripotassium phenolphthalate was described. An account is now given of the preparation of this salt and the corresponding trisodium salt,

which crystallises in rhombohedra, and is more soluble, but less stable, than the potassium salt. Of the three alkali atoms in these salts, two are readily displaced by the action of weak acids, such as acetic and carbonic acids, whilst the third, probably that attached to the carboxyl group, is more resistant, but is easily displaced by mineral acids.

Unsaturated δ -Ketonic Acids. ELMER P. KOHLER (*Amer. Chem. J.*, 1911, 46, 474—502).—Unsaturated δ -lactonic acids have not been prepared for the first time. They can be readily obtained by the methods used for preparing the corresponding saturated compounds, or by introducing bromine into saturated ketonic acids and eliminating hydrogen bromide from the product.

Methyl γ -benzoyl- β -phenylethylmalonate can be obtained in good yield by the condensation of methyl malonate with phenyl styryl ketone in presence of piperidine; on hydrolysis, it yields the free acid. The ethyl ester, $\text{CH}_3\text{Bz}\cdot\text{CHPh}\cdot\text{CH}(\text{CO}_2\text{Et})_2$, m. p. 65°, forms friable needles, and, on bromination, yields two stereoisomeric ethyl γ -bromo- γ -benzoyl- β -phenylethylmalonates, m. p. 88° and 43°, the former crystallising in needles and the latter in large prisms or tablets. The methyl ester similarly yields two bromo-derivatives, m. p. 113° and 81°, crystallising in needles and prisms respectively; on the addition of bromine to solutions of these compounds in carbon tetrachloride two isomeric methyl α -dibromo- γ -benzoyl- β -phenylethylmalonates, m. p. 132° and 94°, are produced, which crystallise in needles and large tablets respectively.

Methyl γ -benzoyl- β -phenylvinylmalonate, $\text{CHBz}\cdot\text{CPb}\cdot\text{CH}(\text{CO}_2\text{Me})_2$, m. p. 94°, obtained by the action of potassium hydroxide on the methyl γ -bromo- γ -benzoyl- β -phenylethylmalonates, forms large, trans-

parent prisms or tablets; it does not combine with bromine, but yields a bromo-derivative, m. p. 141°, which crystallises in prisms or tablets. When methyl γ -benzoyl- β -phenylvinylmalonate is hydrolysed with potassium hydroxide, mono- and di-potassium salts are produced, which on treatment with acids yield γ -benzoyl- β -phenylbutyrolactonic acid, $\text{H}_2\text{Bz}\cdot\text{CPh}\cdot\text{CH}\cdot\text{CO}_2\text{H}$, which crystallises from water in small, lustrous

prisms containing $2\text{H}_2\text{O}$. When heated the hydrated acid melts at about 100°, then loses water, re-solidifies, and finally melts and decomposes at about 170°. The product of hydrolysis of the unsaturated ester contains also a small quantity of δ -hydroxy- $\beta\delta$ -diphenylcrotonic acid, $\text{OH}\cdot\text{CPh}\cdot\text{CH}\cdot\text{CPh}$

$\text{O}-\text{CO}-\text{CH}\cdot\text{CO}_2\text{H}$, m. p. about 170°, which crystallises in slender needles. When this acid is heated above its m. p. it is converted into benzoylphenylvinylacetic acid and γ -benzoyl- $\beta\delta$ -diphenyl- δ -crotonolactone, $\text{OH}\cdot\text{CPh}\cdot\text{CH}\cdot\text{CPh}\cdot\text{CH}_2$, m. p.

34. When benzoylphenylbutyrolactonic acid is heated at 170–185° and carbon dioxide ceases to be evolved, four substances are produced, namely: (1) γ -benzoyl- β -phenylvinylacetic acid; (2) an acid, m. p. 180°, isomeric with γ -benzoyl- β -phenylvinylacetic acid, and crystallising in large plates; (3) γ -benzoyl- β -phenyl- β -butyrolactone, m. p. 172°, which forms thin, lemon-yellow plates.

γ -Benzoyl- β -phenylvinylacetic acid, $\text{CHBz}\cdot\text{CPh}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$, m. p. 135°, forms small, colourless prisms. When a solution of this acid in methyl alcohol is saturated with hydrogen chloride, methyl β -chloro-benzoyl- β -phenylbutyrate, $\text{CH}_2\text{Bz}\cdot\text{CPhCl}\cdot\text{CH}_2\cdot\text{CO}_2\text{Me}$, m. p. 131°, is reduced, which crystallises in slender needles. The unsaturated acid combines with bromine to form two stereoisomeric $\beta\gamma$ -dibromo- γ -benzoyl- β -phenylbutyric acids, $\text{CHBzBr}\cdot\text{CPhBr}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$, which decompose without melting; one form crystallises in plates and the other in slender needles. When these dibromides are added to solution of sodium hydrogen carbonate, they are converted into a lactone, probably $\text{HBr}\cdot\text{CPh}\cdot\text{CH}$, m. p. 131°, which forms pale yellow needles.

γ -Benzoyl- β -phenyl- β -butyrolactone, $\text{CH}_2\text{Bz}\cdot\text{CPh}\cdot\text{CH}_2$, m. p. 93°,

crystallises in needles or prisms, and is very stable; it is not affected when boiled with water or sodium carbonate solution, and does not decompose when heated at 200°. When the lactone is added to alcoholic potassium hydroxide, it is converted into γ -benzoyl- β -phenylvinylacetic acid, and if treated with methyl alcohol and hydrogen chloride, it is transformed into methyl β -chloro- γ -benzoyl- β -phenylbutyrate. If a solution of the lactone in glacial acetic acid is saturated with hydrogen bromide, β -bromo- γ -benzoyl- β -phenylbutyric acid, $\text{CH}_2\text{Bz}\cdot\text{CPhBr}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$, is produced, which forms long needles

and decomposes without melting. When an ethereal solution of γ -benzoyl- β -phenyl- β -butyrolactone is treated with magnesium metal bromide and the product is decomposed with water before the addition of acid, δ -hydroxy- $\beta\delta$ -diphenyl- β -heptolactone,

m. p. 190°, is produced, but if the magnesium derivative is poured directly into a mixture of ice and hydrochloric acid, a stereoisomeric m. p. 140°, is formed. On adding acids to solutions of the potassium salts of these lactones, a third isomeric, m. p. 150°, is obtained, which must be a δ -lactone.

γ -Bromo- γ -benzoyl- β -phenylbutyric acid, $\text{CHBzBr} \cdot \text{CHPh} \cdot (\text{CH}_2)_3 \cdot \text{CO}_2\text{H}$, was obtained in two stereoisomeric forms by the action of bromine on benzoylphenylbutyric acid, one, m. p. about 189° (decomp.), which forms flat needles or plates, and the other, m. p. 145° (decomp.), which crystallises in small prisms; the corresponding methyl esters have m. p. 132° and 87° respectively. When these bromo-acids are dissolved in a solution of sodium carbonate, each is converted into a mixture of two stereoisomeric γ -benzoyl- β -phenyl- γ -butyrolactones,

one, m. p. 130°, forming large tablets, and the other, m. p. 98°, lactone needles. γ -Hydroxy- γ -benzoyl- β -phenylbutyric acid,

m. p. 160° (decomp.), obtained when either of the lactones is dissolved in alcoholic potassium hydroxide and subsequently acidified, forms long, colourless needles. By the action of magnesium ethyl bromide on the lactone of m. p. 130°, γ -hydroxy- γ -benzoyl- β -phenyl- γ -heptolactone

in needles.

E. G.

peri-Naphthalideacetic Acid. HERMANN PAULY [with WILHELM WALTER] (*Ber.*, 1911, 44, 2785—2786. Compare Sachs and Eng.

this vol., i, 719).—This substance, $\text{C}_{10}\text{H}_6 \begin{array}{c} \text{O} \\ \diagup \quad \diagdown \\ \text{CO} \end{array} \text{CH} \cdot \text{CH}_2 \cdot \text{CO}_2\text{H}$, was prepared by oxidation of naphthalidedimethyl ketone (Zink, *Abstr.* 1902, i, 159) with sodium hypobromite. It crystallises in rosettes of needles, m. p. 168.5° (bath previously heated), 158° (bath not previously heated). The silver salt, $\text{C}_{14}\text{H}_9\text{O}_4\text{Ag}$, forms microscopic laminae.

R. V. S.

Preparation of Acyl Derivatives of *o*-Salicyloxybenzoic Acids. C. F. BOEHRINGER & SÖHNE (D.R.-P. 236196 and 237211).—When *o*-salicyloxybenzoic acid is treated with condensing agents such as acetic anhydride, acyl derivatives of general formula

(R=an acyl group) are obtained, and the acetyl and ethylcarbonates derivatives (*Abstr.*, 1910, i, 386) have now been prepared by the

of acetic anhydride and ethylchlorocarbonate respectively on acetyloxybenzoic acid.

Benzyloxy-o-benzoyloxybenzoic acid, leaflets, m. p. 153°, was obtained by the action of benzoyl chloride on *o*-salicyloxybenzoic acid in aqueous alkaline solution, and *o*-salicyloxybenzoyl carbonate,

p. 192°, in a similar manner with carbonyl chloride.

The second patent states that the preparation of *o*-acyloxybenzoyloxybenzoic acids proceeds smoothly without the application of heat if the required *o*-acyloxybenzoic acid is left in contact with a tertiary amine during a long period. A solution of acetyloxybenzoic acid in pyridine was used after some days to contain *o*-acetyloxybenzoyloxybenzoic acid, and a dimethylaniline solution of ethylcarbonylsalicylic acid furnished ethylcarbonyloxybenzoyloxybenzoic acid.

F. M. G. M.

Angeli-Rimini Reaction of the Aldehydes. LUIGI BALBIANO *Atti R. Accad. Lincei*, 1911, [v], 20, ii, 245—249. Compare Paolini, *ibid.*, i, 779; Tiffeneau, *Abstr.*, 1910, i, 379).—The author now adds that the above reaction is given also by anisylacetone and other ketones, so that he no longer maintains the opinion that the substance obtained by the dehydration of anethole glycol is an aldehyde.

R. V. S.

Solutions of Benzaldehyde and Hydrogen Cyanide in Water. LEOPOLD ROSENTHALER (*Arch. Pharm.*, 1911, 249, 510—511. Compare *Abstr.*, 1909, i, 623).—A reply to Wirth, this vol., i, 875.

T. A. H.

Preparation of *o*-Nitrobenzaldehyde. SOCIÉTÉ CHIMIQUE DES BAINS DU RHÔNE (D.R.P. 237358).—When dilute aqueous solutions of salts of *o*-*o*-dinitrotoluene are treated at a low temperature with potassium permanganate, they yield *o*-nitrobenzaldehyde according to the equation:

If the mixture is kept neutral or only slightly alkaline, a theoretical amount of pure *o*-nitrobenzaldehyde is produced.

F. M. G. M.

Oxidation of *m*-Nitrobenzoylformaldehyde. WILLIAM L. EVANS and EDGAR JOHN WITZEMANN (*J. Amer. Chem. Soc.*, 1911, 33, 172—1779).—In an earlier paper (*Abstr.*, 1908, i, 338) an account has been given of the behaviour of *m*-nitrobenzoylcarbinol towards oxidising agents. The work has now been extended to the preparation and oxidation of *m*-nitrobenzoylformaldehyde.

The *osazones* of *m*-nitrobenzoylformaldehyde, m. p. 223°, form dark needles.

When the aldehyde is treated with potassium permanganate in neutral or alkaline solution, or with potassium ferricyanide, freshly precipitated silver oxide, or freshly precipitated mercuric oxide in presence of sodium hydroxide in each case, *m*-nitrobenzoic acid is the sole product of oxidation. In the absence of alkali hydroxide,

freshly precipitated silver oxide and mercuric oxide do not effect the oxidation of the compound at the ordinary temperature, but at 100° convert it into *m*-nitrobenzoic acid. When the aldehyde is treated with hot solutions of copper acetate or with alkali hydroxides, it is transformed into *m*-nitromandelic acid.

The results of these experiments and those recorded in the earlier paper (*loc. cit.*) indicate that *m*-nitrobenzoylcarbinol and *m*-nitrobenzoylformaldehyde behave similarly to the parent substances (compare Evans, Abstr., 1906, i, 269), but that they are more sensitive to reagents in the presence of alkali hydroxides. Moreover, the nitro-derivatives show a greater tendency to progress to the benzoic acid stage, yielding *m*-nitrobenzoic acid, than to give the possible intermediate compounds, namely, *m*-nitromandelic and *m*-nitrophenylglyoxylic acids.

F. G.

Catalytic Conversion of 1-Methylcyclopentane-3-one into Methylcyclopentane. NICOLAI D. ZELINSKY (*Ber.*, 1911, 44, 2781—2782).—Skita and Ritter (this vol., i, 272) have shown that the catalytic reduction of a number of substances containing six-membered rings is attended by the production of small quantities of the corresponding saturated cyclic hydrocarbons. The author finds that catalytic reduction of 1-methylcyclopentane-3-one with nickel at 150—160° yields a mixture of water, the alcohol, the ketone, and the hydrocarbon, whilst if the temperature is raised to 250°, methylcyclopentane is obtained in good yield. The fact that at this temperature no dehydrogenisation occurs marks the difference between the five-membered and the six-membered ring.

R. V. S.

Catalytic Reduction in a Vacuum. NICOLAI D. ZELINSKY (*Ber.*, 1911, 44, 2779—2780).—Reductions by means of hydrogen in the presence of nickel can be accomplished under reduced pressure. From 1:3-dimethyl- Δ^3 -cyclohexene-5-one at 200° and 75—80 mm., 1:3-dimethylcyclohexanone was obtained. From isophorone at a pressure of 70—75 mm., the temperature of the nickel being 180°, dihydroisophorone was produced.

R. V. S.

Synthesis of New Hydroaromatic Ketones. GEORGE DARZENS and H. ROST (*Compt. rend.*, 1911, 153, 772—775. Compare Abstr., 1910, i, 856; 1907, i, 627).—A description of new ketones obtained by the action of an organomagnesium halides on acid chlorides at -10°. The products are purified from small quantities of tertiary alcohols through the agency of their semicarbazones.

cyclohexacyclohexene, $C_6H_{11} \cdot CO \cdot C_6H_9$, b. p. 136°/19 mm., forms a semicarbazone, m. p. 117—118°.

n-Butylcyclohexene, $C_6H_{11} \cdot CO \cdot C_4H_9$, b. p. 94°/13 mm., forms a semicarbazone, m. p. 153—154°.

The following acid chlorides were obtained by the action of thionyl chloride on the acids: cyclohexeneacetyl chloride, $C_6H_{11} \cdot CH_2 \cdot COCl$, b. p. 98—100°/23 mm.; 2-methylcyclohexeneacetyl chloride, b. p. 104—105°/13 mm.; 3-methylcyclohexeneacetyl chloride, b. p. 95—96°/11 mm.; 4-methylcyclohexeneacetyl chloride, b. p. 109—110°/8 mm.; 4-methylcyclohexylacetyl chloride, b. p. 75°/7 mm.

1-Methyl-4-tert-butylcyclohexanone (this vol., i, 290) condenses with ethyl chloroacetate, giving ethyl hydroxy-1-methyl-4-tert-butylcyclohexanecarboxylate, $C_6H_3 \cdot C_4H_9(OH) \cdot CH_2 \cdot CO_2Et$, b. p. 129—131°/3 mm. It has been converted into ethyl 1-methyl-4-tert-butylcyclohexanecarboxylate, b. p. 136—139°/10 mm.; the corresponding acid has b. p. 174—177°/10 mm., and the chloride, b. p. 127—128°/8 mm. Ethyl 1-methyl-4-tert-butylcyclohexanecarboxylate has b. p. 146—149°/14 mm.; the corresponding acid has b. p. 173—176°/12 mm., and the chloride, b. p. 134—136°/12 mm.

These new chlorides give rise to the following ketones when treated with magnesium methyl iodide: 1-Acetylcyclohexene,

b. p. 79—80°/11 mm.; semicarbazone, m. p. 176°. Acetonyl-2-methylcyclohexene, b. p. 212°; semicarbazone, m. p. 170°. Acetonyl-3-methylcyclohexene, b. p. 208—207°; semicarbazone, m. p. 154°. 1-Acetylmethylcyclohexene, b. p. 208°; semicarbazone, m. p. 160—161°. Acetonylmethylbutylcyclohexene, b. p. 135—136°/10 mm.; semicarbazone, m. p. 206°.

W. O. W.

Action of the Chloroanhydride of cycloPropanecarboxylic Acid on Benzene in Presence of Aluminium Chloride. NICOLAI M. KUNER (*J. Russ. Phys. Chem. Soc.*, 1911, 43, 1163—1173).—The author has confirmed the formation of benzoylcyclopropane by the decomposition of benzoylcyclopropanecarboxylic acid (Perkin), and shows that this ketone is also obtained by the interaction of the chloroanhydride of cyclopropanecarboxylic acid and benzene in presence of aluminium chloride at 35—60°. Benzoylcyclopropane, obtained by the latter method, gives a γ -benzoylpropyl bromide, m. p. 35°, whilst this compound when prepared from the benzoylcyclopropane given by Perkin's method has m. p. 30.5°; this difference is not explained. The action of potassium hydroxide on γ -benzoylpropyl bromide yields benzoylcyclopropane.

m-Nitrobenzoylcyclopropane, $NO_2 \cdot C_6H_4 \cdot CO \cdot CH \begin{smallmatrix} CH_2 \\ CH_2 \end{smallmatrix}$, separates from methyl alcohol in rectangular plates, m. p. 77°, and on reduction with tin and hydrochloric acid yields a crystalline base, m. p. 97—98°, the diazo-compound of which combines with naphthols, forming scarlet azo-colouring matters.

cycloPropylbenzylamine, $NH_2 \cdot CHPh \cdot CH \begin{smallmatrix} CH_2 \\ CH_2 \end{smallmatrix}$, obtained by reducing the oxime of benzoylcyclopropane in alcoholic solution with sodium, has b. p. 234.7—235°/749 mm., D_4^{20} 0.9996—1.0019, D_4^{25} 0.9884, D_4^{30} 0.9843, n_D^{20} 1.5353—1.5360. The hydrochloride, m. p. 220—221°, platinumchloride, $(C_{10}H_{11}NH_2)_2PtCl_6$, m. p. 177° (decomp.), and the thiocarbamide, $NHPh \cdot CS \cdot NH \cdot C_{10}H_{11}$, m. p. 124°, were prepared. Oxidation of the amine by means of permanganate yields benzoylcyclopropane.

Phenylcyclopropylmethylcarbinol, $OH \cdot CPhMe \cdot CH \begin{smallmatrix} CH_2 \\ CH_2 \end{smallmatrix}$, obtained by the interaction of benzoylcyclopropane and magnesium methyl

iodide, has b. p. 241—242°/761 mm., 151—152°/51 mm., D_D^{20} 1.5350.

α -Phenyl- α -cyclopropylethylene, $\text{CH}_2\cdot\text{CPh}\cdot\text{CH}\begin{smallmatrix} \text{CH}_2 \\ \text{CH}_2 \end{smallmatrix}$, prepared by the action of acetic acid on the preceding compound, has b. p. 211—213°/758 mm., D_D^{20} 0.9553, n_D^{20} 1.5497, and gives a golden-yellow coloration with a drop of concentrated sulphuric acid. T. H. P.

Aromatic Amino-ketones. FRANZ KUNCKELL (*Ber. deut. pharm. Ges.*, 1911, 21, 419—456).—Various amino-ketones, in the form of their acetyl derivatives, have been prepared by heating acetanilide and an acyl halide with aluminium chloride in carbon disulphide and decomposing the resulting aluminium double compound with very dilute hydrochloric acid at 0°; the hydrolysis of the acetyl derivative is effected by 20% hydrochloric acid. It seems essential to success in the process that the acyl halide should have a b. p. exceeding 80—90° or should be halogenated; for instance, the method fails with acetyl chloride or isobutyryl chloride, but yields good results with acetyl bromide or chloroacetyl chloride.

p-Aminopropiophenone, $\text{NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{COEt}$, m. p. 140°, yellow needles, forms an acetyl derivative, m. p. 161°, hydrochloride, m. p. 225°, sulphate, m. p. 225°, oxime, m. p. 153°, and ethyl carbamate, m. p. 154°. It reacts with carbonyl chloride in benzene to form di-*p*-propionyl phenylcarbamide, $\text{CO}(\text{NH}\cdot\text{C}_6\text{H}_4\cdot\text{COEt})_2$, m. p. 271°, whilst its hydrochloride reacts with hot aqueous potassium cyanate to form *p*-propionyl phenylcarbamide, m. p. 218°.

p-Aminobutyrophenone, m. p. 84°, colourless needles, forms an acetyl derivative, m. p. 142°, hydrochloride, m. p. 178°, sulphate, m. p. 216°, ethyl carbamate, m. p. 128°, and benzoyl derivative, m. p. 170°. *p*-Butyrylphenylcarbamide and di-*p*-butyrylphenylcarbamide have m. p. 194° and 235° respectively.

ω -Chloro-*p*-acetylaminacetophenone, $\text{NHAc}\cdot\text{C}_6\text{H}_4\cdot\text{CO}\cdot\text{CH}_2\text{Cl}$, m. p. 212°, yields *p*-acetylaminobenzoic acid by oxidation, and forms the following derivatives in consequence of the reactivity of the chlorine atom: *p*-Acetylaminophenyl phenoxymethyl ketone,

m. p. 145°; *p*-acetylaminobenzoylmethyl acetate,

m. p. 162° (the hydrolysis of which yields *p*-acetylmino- ω -hydrazoacetophenone, m. p. 176°, phenylhydrazone, m. p. 223°); *p*-acetylaminobenzoylmethylbenzoate, m. p. 200—201°; and *p*-acetylaminino- ω -phenyliminoacetophenone, $\text{NHAc}\cdot\text{C}_6\text{H}_4\cdot\text{CO}\cdot\text{CH}_2\cdot\text{N}\begin{smallmatrix} \text{CO} \\ \text{CO} \end{smallmatrix}\text{C}_6\text{H}_5$, m. p. 271°.

By treatment with nitric acid, D 1.5, at 0°, ω -chloro-*p*-acetylaminacetophenone yields ω -chloro-*m*-nitro-*p*-acetylaminacetophenone, yellow crystals, m. p. 120°; ω -chloro-*m*-nitro-*p*-aminoacetophenone, m. p. 185°, obtained by its hydrolysis, yields *m*-nitro-*p*-aminobenzoic acid on oxidation. The bromination of ω -chloro-*p*-acetylaminacetophenone in chloroform at 100° yields ω -chloro-2:5-dibromo-4-acetylaminacetophenone, m. p. 137°, the oxidation of which by alkaline hydrogen peroxide yields 2:5-dibromo-4-aminobenzoic acid, m. p. above 350°.

acid yields 2:5-dibromobenzoic acid and *p*-dibromobenzene by the successive elimination of the amino- and the carboxyl groups. *ω*-Chloro-*p*-aminoacetophenone, m. p. 146°, obtained by the hydrolysis of its benzoyl derivative, forms a hydrochloride and benzoyl derivative, m. p. 177°. It reacts with potassium acetate and potassium benzoate respectively to form *p*-aminobenzoylmethyl acetate,

m. p. 135°, and the corresponding benzoate, m. p. 188°; the hydrolysis of the former yields *p*-amino-*ω*-hydroxyacetophenone,

m. p. 165° (phenylhydrazones, m. p. 199°).

By bromination in glacial acetic acid at 70°, *ω*-chloro-*p*-acetylaminobenzophenone yields *ω*-chloro-*ω*-bromo-*p*-acetylaminobenzophenone,

m. p. 163°, which is converted into *p*-acetylaminobenzoic acid by oxidation and into *ω*-chloro-*ω*-bromo-*p*-aminoacetophenone, m. p. 80-5° (hydrochloride, m. p. 182°), by hydrolysis. By diazotisation and treatment with cuprous cyanide, *ω*-chloro-*p*-aminoacetophenone yields *p*-chloroacetylbenzonitrile, $\text{CN}\cdot\text{C}_6\text{H}_4\cdot\text{CO}\cdot\text{CH}_2\text{Cl}$, m. p. 98-100°, which is converted into the corresponding acid, m. p. 210°, by hydrolysis.

Chloroacetyl chloride, *m*-chloroacetanilide, and aluminium chloride react in carbon disulphide to form *ω*-*m*-dichloro-*p*-acetylaminobenzophenone, $\text{NHAc}\cdot\text{C}_6\text{H}_3\text{Cl}_2\cdot\text{CO}\cdot\text{CH}_2\text{Cl}$, m. p. 146-147°, which has been converted successively into 2-chloro-4-aminobenzoic acid and 2-chloro-4-hydroxybenzoic acid, and yields by hydrolysis *ω*-*m*-dichloro-*p*-aminoacetophenone, m. p. 96-97° (hydrochloride, m. p. 178°). In a similar manner, chloroacetyl chloride and *m*-bromoacetanilide yield *ω*-chloro-*m*-bromo-*p*-acetylaminobenzophenone, m. p. 113°, which is converted into the amino-compound, m. p. 97-98° (hydrochloride, m. p. 180°), by hydrolysis and into 2-bromo-4-aminobenzoic acid by oxidation. Chloroacetyl chloride and *o*-acetotoluidide yield *ω*-chloro-3-acetylaminobenzophenone, $\text{NHAc}\cdot\text{C}_6\text{H}_4\text{Me}\cdot\text{CO}\cdot\text{CH}_2\text{Cl}$, m. p. 160°, which is converted by oxidation, hydrolysis, and diazotisation successively into *o*-acetylaminobenzotoluic acid, m. p. 267-270° (decomp.), *o*-amino-*p*-toluic acid, and *p*-toluic acid; it yields *ω*-chloro-*ω*-bromo-3-acetylaminobenzophenone, m. p. 110°, by bromination in acetic acid, and reacts with potassium acetate or benzoate to form an acetate,

m. p. 90°, or benzoate, m. p. 130°. The nitration of *ω*-chloro-3-acetylaminobenzophenone yields a nitro-compound, m. p. 204°, the constitution of which is proved by its conversion ultimately into *o*-nitro-*p*-toluic acid.

ω-Chloro-5-acetylaminobenzophenone, m. p. 145°, yields *m*-chloroacetyl-*m*-toluidine, m. p. 132°, by hydrolysis. C. S.

α-Aminoisobutyrophenone, $\text{NH}_2\cdot\text{CMe}_2\cdot\text{COPh}$. SIEGMUND GABRIEL (*Ber.*, 1911, 44, 3091-3092).—When kept for three weeks, *α*-aminoisobutyrophenone (this vol., i, 212) is converted into a crystalline substance, $\text{C}_{10}\text{H}_{11}\text{O}_2\text{N}$, which separates from light petroleum in lustrous, glassy, flat, obliquely-cut needles or rhombohedral crystals,

m. p. 105—106°. An aqueous solution of the compound becomes strongly alkaline when boiled with water, owing to reconversion into the original amino-ketone. It dissolves in warm hydrochloric acid, yielding α -aminoisobutyrophenone hydrochloride, which forms a platinum chloride, $(C_{10}H_{13}ON)_2H_2PtCl_6$, m. p. 205—206°, with previous sintering at 195°.

F. E.

Oxidation of Aniline. III. RIKŌ MAJIMA and YOSHIMIKO ARAI (*Ber.*, 1911, 44, 3080—3084. Compare this vol., i, 216).—By the oxidation of aniline with lead peroxide, Börnstein (*Abstr.*, 1891, i, 375) obtained a compound, which he considered to be 2-amino-*p*-benzoquinonedianil. The compound is readily prepared by oxidizing aniline in aqueous acetic acid solution at 0° with lead peroxide. Determinations of the molecular weight and analysis of its hydrochloride show that it has the composition $C_{24}H_{20}N_4$, and not $C_{24}H_{18}N_4$. From its solubility in organic solvents, and the fact that it yields α -phenine when heated with aniline in glacial acetic acid solution, the authors conclude that it has the constitution:

2-Amino-5-anilino-*p*-benzoquinonedianil forms a *monohydrochloride*, $C_{24}H_{20}N_4 \cdot HCl$, and a *dihydrochloride*, $C_{24}H_{20}N_4 \cdot 2HCl \cdot 3H_2O$; the *acetyl* derivative, $C_{26}H_{22}ON_4$, crystallises in long, bluish-red prisms, m. p. 212°.

Binary Systems of which One Component is an Organic Compound and the Other an Inorganic Salt. BORIS N. MENSCHUTKIN (*J. Chim. Phys.*, 1911, 9, 538—558. Compare this vol., i, 65).—A résumé of the author's work since 1903 on the additive organic compounds of magnesium, aluminium, and calcium haloids.

R. J. C.

Photochemical Reactions of the Nitrophenylindones. 1. MARUSSIA BAKUNIN and E. LAKIS (*Gazzetta*, 1911, 41, ii, 155—184).—4-Nitro-2-phenylindone, when kept in sunlight, yields a substance, m. p. 320—325° (decomp.), which has the same percentage composition and is very indifferent to chemical reagents. Solutions of 4-nitro-2-phenylindone in various solvents, when exposed to light, deposited crystalline substances (apparently mixtures) of different and inconstant melting points. From the ethereal solution three substances are produced, which cannot be separated by recrystallisation, but on melting the mixture of all three the substance of m. p. 218° is converted into 4-nitro-2-phenylindone, which can be removed. From the remainder, two substances can be obtained, one having m. p. 280°, and the other m. p. about 320°; the latter is identical with the substance obtained from 4-nitro-2-phenylindone without a solvent. The products obtained in the case of other solvents were similar to the three just described.

6-Nitro-2-phenylindone remains unchanged in sunlight, but when it is

solutions are exposed to light, mixtures of crystalline substances are produced. In the case of the benzene solution the product was separated into three substances, m. p. 227°—229°, about 280°, and above 300° respectively.

In the formation of 4-nitro-2-phenylindone from 4-nitro- α -phenyl-diamine and phosphoric oxide in chloroform, a small quantity of a yellow, crystalline substance, m. p. 286°, is obtained.

R. V. S

Chloroiminoquinones. LEMUEL CHARLES RAIFORD (*Amer. Chem. J.*, 1911, 43, 417—456).—Stieglitz and Earle (Abstr., 1904, i, 39) have described stereoisomeric chloroimino-acid ethers, and Stieglitz and Peterson (Abstr., 1910, i, 323; this vol., i, 879) have prepared stereoisomeric chloroimino-ketones. In the present paper, an account is given of experiments undertaken with the object of determining whether stereoisomerism could be observed in the chloroiminoquinones. Six chloroiminoquinones of a structure which should admit of the formation of stereoisomerides have been studied, but in no case was stereoisomerism discovered.

2-Bromo-4-aminophenol, m. p. 165°, crystallises in pale brown needles; its hydrochloride darkens at 225°, but does not melt.

2-Bromo-4-chloroiminoquinone, $O=C_6H_3BrCl$, prepared by the action of hypochlorous acid on 2-bromo-4-aminophenol, forms yellow crystals, and decomposes at about 60°.

2-Chloro-6-bromo-4-aminophenol, m. p. 181°, obtained by reducing the corresponding nitrophenol with stannous chloride, crystallises in thin plates, and is probably identical with the compound obtained by Clark (Abstr., 1893, i, 321). 2-Chloro-6-bromo-4-chloroiminoquinone, m. p. 87°—88°, forms yellow crystals.

2:4:6-Trichloro-*m*-cresol, m. p. 47°, prepared by the action of sodium hypochlorite on *m*-cresol, crystallises in colourless plates, and on oxidation is converted into 2:6-dichlorotoluquinone; the acetate, b. p. 273°—274°, was obtained as a colourless, viscous liquid.

When a solution of 2:4:6-tribromo-*m*-cresol in glacial acetic acid is treated with sodium nitrite, 2:4-dibromo-6-nitro-*m*-cresol, m. p. 134° (decomp.), and 2:6-dibromo-4-nitro-*m*-cresol, m. p. 87°, are obtained in yields of 35% and 40% respectively. 2:4-Dibromo-6-amino-*m*-cresol has m. p. 176°; the corresponding benzoylamino-compound, m. p. 198°, forms colourless crystals. 2:4-Dibromo-3-hydroxy-*o*-tolyl-6-urethane, $OH\cdot C_6H_3MeBr_2\cdot NH\cdot CO_2Et$, m. p. 155°, obtained by the action of ethyl chlorocarbonate on 2:4-dibromo-6-amino-*m*-cresol in presence of sodium hydroxide, is a brown solid. 2:6-Dibromo-4-chloroiminoquinone, $O=C_6H_3MeBr_2\cdot NCl$, m. p. 86°, forms yellow, hexagonal plates. 2:6-Dibromo-4-amino-*m*-cresol, m. p. 116°—117°, crystallises in brown scales; its hydrochloride is described. 2:6-Dibromo-4-benzoylamino-*m*-tolyl benzoate, m. p. 188°, forms colourless crystals. 2:6-Dibromo-3-hydroxy-*p*-tolyl-4-urethane has m. p. 169°. 2:6-Dibromo-4-acetylamino-*m*-tolyl acetate, m. p. 216°, crystallises in long, silky needles. When 2:6-dibromo-4-nitro-*m*-tolyl ethyl carbonate, $NO_2\cdot C_6H_3MeBr_2\cdot O\cdot CO_2Et$, m. p. 43°—45°, obtained by the action of ethyl chlorocarbonate on 2:6-dibromo-4-nitro-*m*-cresol in presence of

sodium hydroxide, is reduced with tin and hydrochloric acid, it is converted into 2 : 6-dibromo-3-hydroxy-*m*-tolylurethane.

Kehrmann and Tichvinsky (Abstr., 1899, i, 139) have shown that 4-chlorotoluquinoneoxime exists in two modifications, which, on reduction, give a chloroaminocresol, m. p. 204—205°, identical with that obtained by the reduction of the substance produced by chlorinating 6-nitro-*m*-cresol in glacial acetic acid solution. Attempts have been made to prepare stereoisomeric chloroiminoquinones corresponding with these oximes. A chloroaminocresol prepared from 6-nitro-*m*-cresol had m. p. 166—167°, and on oxidation gave a chloroiminoquinone, m. p. 87°, whilst that similarly obtained from Kehrmann's chloroaminocresol had m. p. 91°. It is shown that these compounds are 2-chloro- and 4-chloro-6-chloroiminotoluquinone respectively.

4-Chloro-6-benzoylamino-*m*-tolyl benzoate, m. p. 220°, prepared from Kehrmann's chloroaminocresol, forms nearly colourless crystals. 4-Chloro-6-chloroiminotoluquinone, $\text{O}:\text{C}_6\text{H}_4\text{MeCl}:\text{NCl}$, m. p. 91°, obtained by the action of hypochlorous acid on Kehrmann's chloroaminocresol, crystallises in radiating needles.

4-Chloro-3-chloroiminotoluquinone, m. p. 65°, prepared in a similar manner from the chloroaminocresol obtained by the electrolytic reduction of 3-nitro-4-chlorotoluene, forms brown nodules.

When 2-chloro-6-nitro-*m*-cresol, $\text{OH}\cdot\text{C}_6\text{H}_3\text{ClMe}\cdot\text{NO}_2$, m. p. 133°, obtained by the chlorination of 6-nitro-*m*-cresol, is reduced with stannous chloride, it is converted into 2-chloro-6-amino-*m*-cresol, m. p. 166—167°, which forms colourless crystals; its hydrochloride darkens above 225°. The acetate of the corresponding acetylamino-compound has m. p. 178°. On oxidation, 2-chloro-6-amino-*m*-cresol yields *o*-chlorotoluquinone, m. p. 55°, which is readily reduced to *o*-chlorotoluquinol, m. p. 173°, crystallising in colourless leaflets. By the action of hypochlorous acid on 2-chloro-6-amino-*m*-cresol, 2-chloro-6-chloroiminotoluquinone, m. p. 87°, is obtained.

By the chlorination of *o*-nitrotoluene, a mixture of 2-chloro- and 4-chloro-6-nitrotoluene is produced. These compounds on electrolytic reduction are converted into 2-chloro- and 4-chloro-6-amino-*m*-cresol, which, on oxidation, yield *p*-chlorotoluquinone, m. p. 105°, and *o*-chlorotoluquinone, m. p. 55°. E. G.

[Preparation of Condensation Products from *p*-Benzoquinone or α -Naphthaquinone.] RUDOLF LESSER (D.R.-P. 236074).

—When the condensation products of quinones (or other diketoderivatives) are reduced in alkaline solution with sodium hyposulphite, valuable dyes are produced. The products from dianilino-*p*-benzoquinone, $\text{C}_6\text{H}_4\text{O}_2(\text{NHPh})_2$, chlorodianilino-*p*-benzoquinone, and chloranilanilide (from aniline and chloranil) are mentioned. The compound, $\text{C}_6\text{Cl}_4\text{O}_2(\text{NH}\cdot\text{C}_6\text{H}_4\cdot\text{OMe})_2$, obtained from chloranil and *p*-anisidine, forms red needles with metallic lustre, and the product,

from *p*-phenetidine and α -naphthaquinone, glistening, metallic, reddish-brown needles. F. M. G. M.

The Partial or Total Replacement of Halogens by Hydrogen in Polyhalogenated Aminoanthraquinones. FARBER FABRIKEN VORM. FRIEDR. BAYER & Co. (D.R.P. 236604).—When polyhalogenated aminoanthraquinones or their derivatives are treated with reducing agents (such as iron and acetic acid) in the presence of pyridine, one or more of the halogen atoms are displaced by hydrogen.

Under these conditions, 2:4-dibromo-1-aminoanthraquinone yields 1-bromo-1-aminoanthraquinone; 2:4-dibromo-1-methylaminoanthraquinone furnishes 2-bromo-1-methylaminoanthraquinone, and 1:3-dibromo-2-aminoanthraquinone gives 3-bromo-2-aminoanthraquinone in brownish-yellow, glistening leaflets.

F. M. G. M.

Preparation of *p*-Dialkylaminobenzyl-1-aminoanthraquinone. FARBER FABRIKEN VORM. MEISTER, LUCIUS & BRÜNING (D.R.P. 236769).—When a mixture of 1-aminoanthraquinone and a tertiary aromatic amine is treated with formaldehyde, it yields a *p*-dialkylaminobenzyl-1-aminoanthraquinone of the general formula

p-Dimethylaminobenzyl-1-aminoanthraquinone, $\text{C}_{23}\text{H}_{20}\text{O}_2\text{N}_2$, obtained when dimethylaniline is employed, has m. p. 211° , and forms orange-red crystals, whilst *p*-diethylaminobenzyl-1-aminoanthraquinone, m. p. 196° , crystallises from xylene in red prisms.

F. M. G. M.

Preparation of Mixed Arylanthraquinonylcarbamides. FARBER FABRIKEN VORM. MEISTER, LUCIUS & BRÜNING (D.R.P. 236979 and 236981).—Arylanthraquinonylcarbamides have previously been prepared; it is now found that the reaction takes place when arylcarbonyl chlorides react with aminoanthraquinones. The product obtained by boiling a nitrobenzene solution of 2-aminoanthraquinone with diphenylcarbonyl chloride in the presence of sodium acetate forms yellow crystals, which does not fuse below 300° ; this reaction is capable of wide extension. The second patent states that when β -aminoanthraquinone is heated with phenylurethane, a yellow powder separates from the cooled mixture, which has the properties of *phenyl- β -anthraquinonylcarbamide*.

F. M. G. M.

Conversion of 1:2-Benzanthraquinone (Naphthanthraquinone) into Anthraquinone-1:2-dicarboxylic Acid. ROLAND SCHÖLL and EMIL SCHWINGER (*Ber.*, 1911, 44, 2992—2998).—*Anthraquinone-1:2-dicarboxylic acid*, $\text{C}_6\text{H}_4 \begin{array}{c} \diagup \text{CO} \diagdown \\ \diagdown \text{CO} \diagup \end{array} \text{C}_6\text{H}_2(\text{CO}_2\text{H})_2$ required for the synthesis of 1:2-phthaloylanthraquinone, has been obtained by the oxidation of 1:2-benzanthraquinone. By oxidation by potassium permanganate in neutral solution, diphtallic acid and anthraquinone-1:2-dicarboxylic acid are both formed, but only in small amount (compare Graebe and Peter, *Abstr.*, 1905, i, 704). However, when a 5% solution of 1:2-benzanthraquinone in concentrated sulphuric acid is added to twice the weight of hot water and the nearly boiling mixture is oxidised by solid potassium permanganate, anthraquinone-

1:2-dicarboxylic acid is formed in 75.5% yield. The same acid is obtained in about 22% yield when the oxidation is effected by nitric acid, D 1.15, at 190—195°.

Anthraquinone-1:2-dicarboxylic acid crystallises in pale yellow needles containing H_2O , yields anthraquinone by distillation with calcium oxide and a little water, and changes at its m. p., 267—268°, into the anhydride, $C_{16}H_6O_5$, m. p. 319—321°, yellow prisms and leaflets, which is converted by ammonia at 225—235° into the imide, m. p. 293°, yellow needles. (C. S.)

Relation between Bisnitroso-compounds and Arylnitroso-hydroxylamines. EUGEN BAMBERGER (*Ber.*, 1911, 44, 3068—3072).—According to Piloty (*Abstr.*, 1902, i, 734) the colourless, bimolecular C-nitroso-compounds and the coloured, unimolecular nitroso-compounds are to be considered as belonging to the same class.

This view is supported by the author, who finds that chloroform, benzene, and glacial acetic acid solutions of certain typical bimolecular nitroso-compounds (hienitrosylbenzyl, *d*-bisnitroscarbonate, *iso*-salicyl- ψ -nitrosite, and anethole- ψ -nitrosite) acquire a blue or bluish-green colour when heated, and accordingly must contain the nitroso-compound in the unimolecular form.

An explanation is also given of the transformation of bisnitroscarbonate, by the action of hydrochloric acid, into chlorocarbonate and carbonobisnitrosylic acid (carbonobisnitrosohydroxylamine) observed by Baeyer (*Abstr.*, 1895, i, 379).

The first stage in the action consists in the dissociation of bisnitroscarbonate into the unimolecular form, which under the influence of hydrogen chloride is converted into chlorocarbonate and nitroxyl $C_{10}H_{15}O \cdot NO + HCl = C_{10}H_{15}OCl + NOH$. The latter compound then unites with a second molecule of the nitroso-compound to form carbonobisnitrosylic acid, $C_{10}H_{15}O \cdot N(OH) \cdot NO$.

The evanescent blue coloration observed on acidifying an alkaline solution of nitroethane is considered by the author to be due to the formation of either nitrosoethyl alcohol, $NO \cdot CHMe \cdot OH$, or the ψ -nitrile, $NO_2 \cdot CHMe \cdot NO$. (F. B.)

Transformations of Thujane. NICOLAI M. KJNER (*J. Russ. Phys. Chem. Soc.*, 1911, 43, 1157—1163).—In the preparation of thujane by the oxidation of thujylhydrazine (this vol., i, 71), the purification of the latter by means of its hydrochloride may lead to the partial inversion of the thujylhydrazine, and hence of the thujane, if any excess of acid is present with the hydrochloride; thus, it was found that the thujane from the pure thujylhydrazine had $[\alpha]_D + 53.41^\circ$, whilst two preparations from the crude hydrazine had $[\alpha]_D + 69.29^\circ$ and $+ 73.07^\circ$ respectively.

When boiled with dilute sulphuric acid (1:6), thujane remains unchanged, whilst in a sealed tube the rotation is slightly lowered.

The action of hydrobromic acid on thujane for a short time yields an unstable bromo-derivative, but prolonged action gives a more stable, inactive bromo-compound, $C_{10}H_{16}Br$, b. p. 111—112°/19 mm., D_4^{20} 1.1812, n_D^{20} 1.4897, which is not decomposed when boiled with aqueous alcoholic

potassium hydroxide. Reduction of this compound in 80% alcohol by means of a copper-zinc couple yields a hydrocarbon, $C_{10}H_{18}$, b. p. $151^{\circ}/746$ mm., D_4^{20} 0.7923, n_D 1.4377. The formation of this hydrocarbon, which is isomeric with menthane, indicates that the action of hydrobromic acid on thujane leads to the rupture of the trimethylene ring with formation of a cyclopentane derivative, probably of the structure: $CHMe_2 \cdot CBr \begin{smallmatrix} CH_2-CH_2 \\ | \quad | \\ CHMe \cdot CHMe \end{smallmatrix}$. As the stable and the

unstable bromo-derivatives give one and the same unsaturated hydrocarbon on decomposition, it is to be assumed that they are structurally identical, and that the difference in stability depends on stereoisomerism of the cis- and trans-type.

The bromo-compound stable to alcoholic potassium hydroxide is decomposed by distillation with quinoline, giving the unsaturated, inactive hydrocarbon, $C_{10}H_{18}$, b. p. $162-164^{\circ}/755$ mm., D_4^{20} 0.8108, n_D 1.4527. The similar hydrocarbon, $C_{10}H_{18}$, obtained by the action of potassium hydroxide on the unstable bromo-derivative, has b. p. $163-164^{\circ}/755$ mm., D_4^{20} 0.8131, n_D 1.4540, $[\alpha]_D +2.88^{\circ}$, whilst the isomeric hydrocarbon prepared by the action of potassium hydroxide on the iodo-compound has b. p. $162.5-163.5^{\circ}/751$ mm., D_4^{20} 0.8111, n_D 1.4527, $[\alpha]_D +0.2^{\circ}$. Each of the three hydrocarbons gives a raspberry-red coloration with acetic acid. These hydrocarbons are probably of identical structure, which should be one of the three following: $CHMe_2 \cdot C \begin{smallmatrix} CH_2-CH_2 \\ | \quad | \\ CHMe \cdot CHMe \end{smallmatrix}$, $CHMe_2 \cdot C \begin{smallmatrix} CH_2-CH_2 \\ | \quad | \\ CMe \cdot CHMe \end{smallmatrix}$, and

Another isomeric hydrocarbon, $C_{10}H_{18}$, obtained by converting thujane into the dibromo-compound, $C_{10}H_{18}Br_2$, and decomposing the latter with aqueous-alcoholic potassium hydroxide, has b. p. $162-164^{\circ}/760$ mm., D_4^{20} 0.8163, n_D 1.4520, $[\alpha]_D +23.62^{\circ}$. T. H. P.

Catalytic Isomerisation of α -Pinene. NICOLAI D. ZELINSKY (*Ber.*, 1911, 44, 2782-2784. Compare Zelinsky and Glinka, this vol., i, 870).— α -Pinene (obtained by fractionation of French turpentine) yields an isomeride when treated with hydrogen in presence of palladium black from palladium chloride. This isopinene has b. p. $158.5-159.5^{\circ}$, D_4^{20} 0.8573, n_{20} 1.4641, $[\alpha]_D -38.69^{\circ}$. It does not absorb hydrogen chloride, and a nitrosochloride could not be prepared from it. The author supposes the substance to be produced

by dehydrogenisation of the hypopinene first formed, and assigns to it the annexed formula. The same α -pinene, however, when treated with hydrogen for four weeks under the pressure of the head of acid in a Kipp's apparatus and in the presence of palladium black from palladium ammonium chloride, yields pinene of b. p. $167.5-168^{\circ}/748$ mm. Hydrogenisation of levorotatory pinene by Sabatier's method gave

a hypopinene of b. p. 163—168.5° (corr.), D_4^{20} 0.8542, n_D^{20} 1.469, $[\alpha]_D^{20}$ -13.3°, and another hydrocarbon, $C_{15}H_{18}$, b. p. 163.5—165°, 750 mm., D_4^{20} 0.8512, n_D^{20} 1.4580, $[\alpha]_D^{20}$ -9.58°. R. V. S.

isoLaurolene. IWAN L. KONDAKOFF and I. SCHINDLER (J. Russ. Phys. Chem. Soc., 1911, 43, 992—1000).—Damsky (Abstr., 1888, 293) obtained isolaurolene by distilling the ammonium salt of sulphocamphylic acid in presence of ammonium chloride, but did not indicate the proportions of the two salts used. The authors have investigated this reaction, which they carried out in a current of carbon dioxide, and as molecular proportions of the two salts gave but little hydrocarbon, 2 mole. of ammonium chloride were taken per mol. of sulphocamphylate. The latter should be crystallised from 10% ammonia solution to prevent hydrolysis.

Sulphocamphylic acid, obtained by the action of sulphuric acid on camphoric anhydride, gave m. p. 162—164°, the value 160—165° having been given by earlier workers.

The products obtained by distilling the mixture of ammonium chloride and sulphocamphylate were: isolaurolene; diisopropenyl; a ketone giving an oxime, m. p. 116—118°, and a bromide, softening at 76°, m. p. 79°; β -hydroxyhexahydro-xylic acid (compare Lora and Perkin, Trans., 1907, 79, 332), and possibly other cyclic hydrocarbons.

The reactions probably proceed as follows: The sulphocamphylic acid combines with the hydrogen chloride yielded by dissociation of the ammonium chloride, giving two compounds, which lose hydrogen chloride, with formation of α - and β -campholytic acids. The former of these readily undergoes isomeric change into the latter, which loses carbon dioxide and gives isolaurolene. These two acids may also be transformed, by way of their hydrochlorides, into campholactones, including ψ -campholactone; this then gives (1) the lactone of α -hydroxyhexahydroxylic acid, and from it the corresponding acid, and

(2) xylic acid. The hydroxy-acids corresponding with the campholactones, and, to some extent, the acid corresponding with ψ -campholactone, in consequence of hydration, dehydration, and loss of carbon dioxide and other groups, give a pinacone (annexed scheme), this pinacone then undergoing dehydration to diisopropenyl. These hydroxy-acids also probably give an isomeride of camphorone or the latter itself.

The various products obtained are being investigated. T. H. P.

Santene and its Hydrohalides. IWAN L. KONDAKOFF (J. Russ. Phys. Chem. Soc., 1911, 43, 1107—1116).—The author has previously (Abstr., 1910, i, 327) drawn the conclusion that, on loss of hydrogen chloride, true bornyl chloride and also fenchyl chloride do not yield methylenecamphene and methylenefenchene immediately, but that they give, firstly, a mixture of bornylene and cycloene, and fenchobornylene and fenchocycloene respectively, these then undergoing isomeric change into (1) methylenecamphene, iso-

system, and isocamphene, and (3) fenchene, fenchocyclene, and isofenchene. May (*Diss.*, Berlin, 1910) arrived at a similar conclusion. The present paper records certain observations made in the attempt to confirm the above statement experimentally.

Two natural santenes were employed: that from sandalwood oil (compare Müller, *Abstr.*, 1900, i, 677), and that from the essential oil of the fir (compare Aschan, *Abstr.*, 1908, i, 94), these two being regarded as identical and pure. It is found that, in the latter case, santene cannot be obtained pure by fractionation, since the lower fractions of the oil contain a hydrocarbon with a lower boiling point than santene, whilst the neighbouring fractions with higher boiling points contain camphene and pinene. The hydrocarbon of low b. p. distils at 105–110°, does not change in the air, and is not oxidised by permanganate solution; its nature is under investigation. A hydrocarbon, C_7H_{10} (l), with this b. p. was obtained by Müller (*loc. cit.*) by the dry distillation of calcium teresantalate, either alone or mixed with calcium acetate.

When treated with concentrated hydrochloric acid, the various fractions of fir-santene exhibit the following behaviour: (1) the fraction, b. p. 105–125°, is turned brown, and yields principally a black, caoutchouc-like mass, and hence very little chloro-derivative; (2) that with b. p. 125–142° is coloured yellow, owing to the admixture with that of lower b. p., and gives a chloro-compound liquid at the ordinary temperature, and (3) that boiling at 142–147° remains colourless, and yields a mixture of liquid and solid chloro-derivatives. The santene hydrochloride obtained is identical with norbornyl chloride, and consists of two isomerides, melting at 14° and 81° respectively, assuming the m. p. 81°, given by Müller and by Aschan, to be that of the pure isomeride. Using conditions for its preparation different from those of these authors, it is found that santene hydrochloride from santalol has a lower melting point than 81°. This hydrochloride, when pure, remains unchanged for a long time, but is converted into the isomeride with the lower melting point under the influence of hydrochloric acid.

Contrary to Semmler's statement, the hydrochloride with high melting point is very stable to concentrated alcoholic potassium hydroxide at the ordinary temperature. On the water-bath it undergoes only partial decomposition in five hours, whilst in a sealed tube at 170° it yields in the same space of time the two products: (1) an optically inactive hydrocarbon, C_7H_{14} , b. p. 138.5–142.5°, D^{20}_D 0.8714, n_D 1.46761, and (2) an ether, b. p. about 195°.

The action of concentrated hydrobromic acid on santalol-santene yields a solid hydrobromide, melting in some cases at 25° and in others at 18°, and gradually undergoing change into an inactive liquid isomeride, $C_7H_{15}Br$, b. p. 79–81°/8 mm., D^{18}_D 1.273, n_D 1.50573, which either corresponds with the hydrochloride of lower melting point or represents a mixture of the two isomerides.

When treated with concentrated alcoholic potassium hydroxide, both the liquid and solid hydrobromides yield a mixture of santene and the ether, b. p. 195°. The formation of this ether, in this and also in the preceding case, is regarded as due to condensation.

Oxidation of the santene from the hydrohalides by means of permanganate gives a hydrocarbon, b. p. 137.5—142.5°, satene glycol, and a small quantity of a fragrant-smelling substance. Oxidation of santene from santalol gives the glycol in larger proportion and more rapidly.

The acetyl derivative, $C_9H_{15} \cdot OAc$, of the santenol synthesised from sandalol santene at the ordinary temperature has b. p. 85—89° s. mm., D_{20}^0 0.9859, n_D^{20} 1.45929, and is optically inactive. T. H. P.

Action of Nitrosyl Chloride on the Essential Oil of *Bupleurum fruticosum*. Nitrosochlorides. LUIGI FRANCESCONI and E. SERNAGIOTTO (*Atti R. Accad. Lincei*, 1911, [v], 20, ii, 190—196).—The previous attempts to prepare a nitrosochloride from the essential oil of *Bupleurum fruticosum* (Francesconi and Sanna, this vol., i, 896), by the method used by Wallach (Abstr., 1889, 1069) for carvone having been unsuccessful, the oil was separated into seventeen fractions by distillation in a vacuum, but the method yielded no better results when employed on the separate fractions. By modifying the procedure, however, by omitting the water and acetic acid, a nitrosochloride has been prepared from all the fractions. A well-cooled mixture of an alcoholic solution of the oil with amyl nitrite or ethyl nitrite is well stirred and treated with a saturated alcoholic solution of hydrogen chloride in drops. The crude nitrosochloride, $C_{10}H_{16}ONCl$, obtained is an unstable substance, and, although its m. p. and rotatory power are fairly constant, it is a mixture of at least two nitrosochlorides, termed α and β , which have very different solubilities in chloroform. The more soluble α -nitrosochloride has m. p. 101—102°, $[\alpha]_D^{20}$ -175°; the β -nitrosochloride has m. p. 100—101°, $[\alpha]_D^{20}$ -285°. R. V. S.

Essential Oil of *Bupleurum fruticosum*, Linn. LUIGI FRANCESCONI and E. SERNAGIOTTO (*Atti R. Accad. Lincei*, 1911, [v], 20, ii, 230—233. Compare this vol., ii, 1025; Francesconi and Sanna, this vol., i, 658, 896).—In the present paper an account is given of the fractional distillation of 10 litres of the essential oil. Seventeen fractions were collected, and the results are given of their examination in respect to refractive index, rotatory power, density, percentage composition, acidity, saponification number, etc. R. V. S.

$\Delta^{1,2}$ -Dihydrocuminaldehyde [and] β -Phellandrene in the Essential Oil of *Bupleurum fruticosum*. LUIGI FRANCESCONI and E. SERNAGIOTTO (*Atti R. Accad. Lincei*, 1911, [v], 20, ii, 325—331. Compare preceding abstract).—It is shown that the dihydrocumin-aldehyde previously obtained from the nitrosochloride from this essential oil is $\Delta^{1,2}$ -dihydrocuminaldehyde. The terpene of the oil is β -phellandrene, although it has a greater rotatory power than this substance as obtained from other sources. It gives a nitrosochloride, which (like its nitrosite) has a rotatory power of opposite sign to its own, and decomposes with production of $\Delta^{1,2}$ -dihydrocumin-aldehyde. R. V. S.

Champaca Oil. BENJAMIN T. BROOKS (*J. Amer. Chem. Soc.*, 1911, 33, 1763—1772).—The flowers of *Michelia champaca* yield 0.37% of an

essential oil, two specimens of which gave the following constants: D_4^{20} 0.9040 and 0.9107; n_D^{20} 1.4640 and 1.4688; ester number, 134 and 146; the ester number of the latter sample after acetylation was 199. The oil contains phenylethyl alcohol, cineol, isoeugenol, benzyl alcohol, benzoic and acetic acids, and a crystalline ketone, $C_{18}H_{20}O_8$, first described by Bacon (this vol., i, 73). This ketone has $[\alpha]_D^{20} - 82.5^\circ$; the phenylhydrazone has m. p. 161° . By a study of the action of alcoholic potassium hydroxide on the ketone, it is shown that it is probably a succinic ester of ethyl alcohol and a ketonic alcohol, $C_{18}H_{20}O_8$, containing the group $-\text{CH}:\text{CH}\cdot\text{CO}-$, and may therefore be represented by the formula $\text{CO}_2\text{Et}\cdot\text{CH}:\text{CH}\cdot\text{CO}_2\cdot\text{C}_{16}\text{H}_{18}\text{O}$.

The essential oil of *Michelia longifolia* differs considerably from that of *M. champaca*, and gives the following constants: D_4^{20} 0.897, n_D^{20} 1.4470, and ester number 180; its most characteristic constituent is methyl or ethyl α -methylbutyrate.

The flowers of both species of *Michelia* contain an oxydase, and it is suggested that to such enzymes the formation of aldehydes and ketones in essential oils is largely due. E. G.

Essential Oil of Santolina chamæcyparissus, L. I. LUIGI FRANCESCONI and P. SCARAFIA (*Atti R. Accad. Lincei*, 1911, [v], 20, ii, 235—260).—The quantity of essential oil contained in the stem of the plant is small, but it is found in considerable quantity in the leaves. The extraction was effected by distillation in steam, and the yield varied from 0.2% to 1.15% of the material taken, the maximum being obtained just before flowering. The densities and the rotatory powers of the various products were not markedly different. The oil begins to distil at 176° at the ordinary pressure. At 15—20 mm., distillation was carried out from 94° to 111° , six fractions being collected. The earlier fractions contained a terpene, whilst in the later ones there are probably hydroaromatic oxygenated compounds. The saponification numbers showed the presence of an ester, and indications of the presence of ketones were obtained. The oil does not contain acids, alcohols, or phenols. R. V. S.

Essential Oil of Santolina chamæcyparissus, L. II. Action of Hydroxylamine. LUIGI FRANCESCONI and P. SCARAFIA (*Atti R. Accad. Lincei*, 1911, [v], 20, ii, 318—324. Compare preceding abstract).—By the action of hydroxylamine hydrochloride on the essential oil in aqueous-alcoholic solution in the presence of sodium hydrogen carbonate, the following substances are produced: (1) the hydroxylamine-oxime of a ketone, $C_{16}H_{16}O$; (2) an oxime of the same ketone; (3) an oxime of another ketone; (4) a hydroxylamine; (5) terpenes and other unaltered substances.

The terpene, after fractionation, has b. p. 165 — 170° , and appears to contain one double linking.

When the product of the reaction is distilled with steam, the distillate contains the two oximes and the hydroxylamine. The oximes can be removed by acidifying and redistilling. The hydroxylamine crystallises in hexagonal laminæ, m. p. 62 — 64° . When oxidised with mercuric oxide it yields a nitroso-compound, which is a colourless, crystalline substance, m. p. 60 — 62° : fused or in solution it is blue.

The oximes are liquids which reduce Fehling's solution after they have been boiled with hydrochloric acid, and at the same time this hydrolysis leads to the production of one or more carbonyl compounds.

The hydroxylamineoxime, $\text{OH}\cdot\text{NH}\cdot\text{C}_{10}\text{H}_{17}\cdot\text{N}\cdot\text{OH}$, obtained by crystallisation from the original reaction product, forms large prisms or thin laminae, which on heating soften at $180-185^\circ$ and melt at 190° ; the liquid evolves gas and resolidifies, melting again at 260° . If the heating is slow, the conversion into the substance of m. p. 240° occurs directly, no previous fusion being observed. The hydroxylamineoxime does not reduce Fehling's solution, unless it has been boiled previously with hydrochloric acid. It does not react with aldehydes. By the action of nitrous acid, a dioxime, $\text{C}_{10}\text{H}_{16}(\text{N}\cdot\text{OH})_2$, is obtained; it forms small, lustrous prisms, m. p. 268° (decomp.). The dibenzoyl dioxime has m. p. $150-155^\circ$. When the hydroxylamineoxime is kept at $190-200^\circ$ for an hour or more, the above dioxime is obtained, and in addition the amino-oxime, $\text{NH}_2\cdot\text{C}_{10}\text{H}_{17}\cdot\text{N}\cdot\text{OH}$, which crystallises in colourless prisms, m. p. 150° .

R. V. S.

Components of Essential Oils. Composition of the Essential Oils of *Xanthoxylum aubertia* (Evodia aubertia), and *Xanthoxylum alatum*. FRIEDRICH W. SEMMLER and F. SCHLOSSBERGER (*Ber.*, 1911, 44, 2885-2890).—The oil of *Xanthoxylum aubertia* was divided into three fractions. Fraction 1, b. p. $70-80/16$ mm., comprised 2-3%, and has $D^{20} 0.8248$, $n_D 1.4977$, $a_D +30$. It is probably an aliphatic terpene. Fraction 2, b. p. $115-130/16$ mm., comprised 80-90%. On purification it had the following properties: b. p. $119-123/9$ mm., $D^{20} 0.8781$, $n_D 1.499$, $[\alpha]_D -58$. It consists in part of a sesquiterpene, *evoidene*, of the same type as limene; eugenol methyl ether is also present, and constitutes 40-60% of the crude oil. The third fraction is a solid, m. p. 85° (about 10% of the oil); it is phloracetophenone dimethyl ether, $\text{C}_{10}\text{H}_{12}\text{O}_4$.

Xanthoxylum alatum.—The first fraction, b. p. $50-60/9$ mm., comprised 80% of the crude oil, and is possibly *l-sabinene*, but is provisionally termed *xanthoxylene*; it has $D^{20} 0.84$, $n_D 1.47457$, $a_D -26^\circ$, and forms a hydrochloride, b. p. $83-87/10$ mm., $D^{20} 0.959$, $n_D 1.4824$, $a_D -11^\circ$. The hydrocarbon, $\text{C}_{10}\text{H}_{16}$, obtained from this on reduction showed b. p. $52-58/9$ mm., $D^{20} 0.8275$, $n_D 1.4582$, $a_D -17^\circ$. The oxonide on decomposition yielded an acid, b. p. $174-180/10$ mm. The corresponding *sabinene ketone* has b. p. $102-106/14$ mm., $D^{20} 0.9612$, $n_D 1.47064$, $a_D +14^\circ$.

The second fraction, which only amounted to 5-10% of the crude oil, yields two semicarbazones, m. p. $210-211^\circ$ and 221° . The former corresponds with cuminaldehyde.

The third fraction consisted of phloracetophenone dimethyl ether, $\text{CH}_3\text{C}(\text{OH})\text{C}(\text{COMe})=\text{CH}_2$; it forms a monobromo-derivative, m. p. 187° , an acetyl derivative, m. p. 107° , and a methyl derivative, m. p. 103° (Schimmel & Co., *Report*, 1909; *Abstr.*, 1909, i, 313).

E. F. A.

Apparently Reversible Character of the Vulcanisation Reaction of Caoutchouc by Sulphur. PAUL BARY and L. WITBERT (*Compt. rend.*, 1911, 153, 676—678).—The free and combined sulphur in a sample of vulcanised caoutchouc was estimated, and the former removed by extraction with acetone, or else separated by removing the gum with xylene. After heating the product at 145° for eight hours, the caoutchouc was again analysed in the same way. The results show that ordinary vulcanised caoutchouc is an equilibrium mixture, and that combined sulphur is set free on diminishing the osmotic pressure of the free sulphur. The reaction of vulcanisation is represented as $C_{10}H_{16} + S_2 \rightleftharpoons C_{10}H_{16}S_2$, but the numerical data obtained are not in agreement with the ordinary law of mass action, whatever hypothesis may be adopted as to the degree of polymerisation of the hydrocarbon. The conclusion drawn is that the hydrocarbon molecules having polymerised by union at the double linkings, on vulcanisation sulphur first becomes attached only to the terminal double linkings of a chain; further vulcanisation, therefore, can only occur after depolymerisation.

W. O. W.

Preparation of Substances Resembling Caoutchouc. FARBENFABRIKEN VORM. FRIEDR. BAYER & Co. (D.R.-P. 235686).—When compounds of the general type $:C:C:C:C:$, where the free valencies are saturated partly with hydrogen and partly with alkyl groups, are heated either in the presence or absence of condensing agents, they polymerise into substances like caoutchouc.

Piperylene, $CHMe:CH:CH:CH_2$, when heated at 150° during twenty-four hours or at 90—100° during eight days, yielded a colourless, elastic substance, isomeric with natural caoutchouc.

Plastic masses of similar nature were obtained by heating δ -methyl- Δ^7 -pentadiene, $CMe_2:CH:CH:CH_2$, at 200° during twenty-four hours, also from tetramethylerythrene, $CMe_2:CH:CH:CMe_2$, and from the substance $CH_2 \begin{smallmatrix} CH_2-CH \\ \diagup \quad \diagdown \\ CH_2-CH_2 \end{smallmatrix} > C \cdot CMe:CH_2$.

F. M. G. M.

Clavicepsin, a New Glucoside from *Secale cornutum*. FRANCESCO MARINO-ZUCO and V. PASQUERO (*Gazzetta*, 1911, 41, ii, 368—374).—When *Secale cornutum* is extracted with hot alcohol for several days, the alcoholic solution contains a syrup partly soluble in water. From the aqueous solution, the new glucoside, $C_{18}H_{34}O_{16} \cdot 2H_2O$, can be isolated in the form of acicular crystals, m. p. 91°, or, when anhydrous, 198°. It has $[\alpha]_D^{20} +142.27^\circ$. It is not hydrolysed by emulsin, but with acids it yields 2 mols. of dextrose (identified as phenylhydrazone) and 1 mol. of mannitol (identified by isolation and analysis) according to the equation: $C_{18}H_{34}O_{16} + 2H_2O = 2C_6H_{12}O_6 + C_6H_{11}O_6$.

R. V. S.

Picrotoxin. FRANCESCO ANGELICO (*Gazzetta*, 1911, 41, ii, 337—349. Compare Abstr., 1910, i, 404, 577).—The action of hydriodic acid and phosphorus on either picrotin or picrotoxinin yields an acid, $C_{15}H_{18}O_4$, and a ketone, $C_{14}H_{16}O_3$, previously described. The reaction is accompanied by the evolution of carbon dioxide and a little carbon monoxide.

The action of alkaline permanganate on the acid $C_{15}H_{11}O_7$ gives (in addition to the acids $C_{15}H_{15}O_8$, $C_{15}H_{15}O_9$, and $C_{15}H_{15}O_{10}$) a small quantity of an acid, $C_{14}H_{14}O_8$, which forms small needles, m. p. 169°.

The acid $C_{15}H_{15}O_7$, m. p. 175°, is not a malonic derivative. When it is oxidised with chromic acid in the presence of 25% sulphuric acid it yields a dibasic acid, $C_{12}H_{12}O_7$, which crystallises in needles, m. p. 289—290° (decomp.), and gives a silver salt, $C_{12}H_{10}O_7Ag_2$.

The series of acids which has now been obtained from picrotin and from picrotoxinin is therefore: $C_{15}H_{15}O_7$, $C_{15}H_{15}O_8$, $C_{15}H_{15}O_9$, $C_{15}H_{15}O_{10}$, $C_{14}H_{14}O_8$, $C_{13}H_{12}O_7$, and $C_{12}H_{12}O_7$.

The author suggests the annexed formula for picrotin. Picrotoxinin would then be the unsaturated (hexahydronaphthalene) derivative containing no hydroxyl groups, but having also

the two oxygen atoms of unknown function.

With a view to determining the function of these oxygen atoms, experiments have been made on various products with phosphorus pentachloride. The monocarboxylic acid, $C_{15}H_{15}O_8$, remains unaltered. The halogenated ketone yields an oily, chlorinated product, which gives a phenylhydrazone, and the halogenated ketone also yields a small quantity of a substance, m. p. 168—169°. The ketone, $C_{14}H_{14}O_7$, gives the same results, but in this case the substance of m. p. 168—169° was analysed, and corresponds with the union of 2 mols. of ketone less $1H_2O$, or $C_{28}H_{20}O_2Cl_2$. The ketone, $C_{14}H_{14}O_8$, when distilled with zinc dust gives traces of a substance, probably a hydrocarbon, of which the picrotin has m. p. 205—206°.

The nitro-acid, $C_{15}H_{15}O_8N$ (compare Abstr., 1910, i, 578), is accompanied by a small quantity of a substance, m. p. 86—87°. When reduced with ammonium sulphide in the warm, the nitro-acid gives the corresponding amino acid, $C_{15}H_{17}O_8N, H_2O$, m. p. 175—176°. The amino-acid is oxidised by permanganate at the ordinary temperature, giving a tribasic acid, $C_7H_{10}O_8$, which crystallises in small needles, m. p. 95°, and gives a silver salt, $C_7H_8O_8Ag_3$. R. V. S.

Composition of Tannin. WILHELM STEINKOPF and JOHANN SARGARIAN (*Ber.*, 1911, 44, 2904—2906).—Iljin (Abstr., 1909, i, 506) has stated that tannin derived from the commercial product by repeated purification has the composition 54.13% C and 3.22% H, values which are not in agreement with those usually obtained or with Nierenstein's formula. A careful repetition of Iljin's experiments indicates values 52.69% C and 3.77% H, in full agreement with those of previous observers. E. F. A.

Bile Pigments. II. Urobilinogen of Urine and the Nature of Ehrlich's Aldehyde Reaction. HANS FISCHER and FRIEDRICH MEYER-BETZ (*Zeitsch. physiol. Chem.*, 1911, 75, 232—261. Compare this vol., i, 803).—Urobilinogen has been prepared from pathological

urine in a crystalline form, and identified with hemibilirubin by the crystallographic characters. A number of unstable pyrrole derivatives, including all the crystalline blood pigments and the bile pigments at present known, are converted into urobilin on decomposition, both in experiments in test-tubes and in the organism. All these unstable pyrrole compounds contain a hydrogen atom attached to one of the carbon atoms in the chain, and they all give the Ehrlich reaction with *p*-dimethylaminobenzaldehyde.

The urobilinogen and urobilin tests are not decisive when they are given after unnatural substances have been administered to the animal; urobilinogen, moreover, may be present in urine in considerable quantity without giving the aldehyde reaction.

Ehrlich has shown that certain pathological urines give an intense red coloration with dimethylaminobenzaldehyde in acid solution. The dye in question is now shown to be a dipyrrolylphenylmethane dye formed by a secondary reaction from the corresponding leuco-base.

Ethyl 2:5-dimethylpyrrole-3-carboxylate condenses with anisaldehyde to form a colourless, crystalline substance, $C_{26}H_{32}O_3N_2$, m. p. 199—200 (corr.).

The pyrrole derivative also condenses with *p*-dimethylaminobenzaldehyde in acid alcoholic solution to a colourless, crystalline leuco-base, $C_{27}H_{32}O_4N_2$, m. p. 239°. On oxidation with ferric chloride, the dye is obtained; it forms a hard, dark red, lustrous mass, with a green reflex. The colour is stable towards acids, but altered by sodium hydroxide, although restored again on making the solution acid. It has the properties of a triphenylmethane dye.

The corresponding dyo from hemibilirubin and *p*-dimethylaminobenzaldehyde is reddish-violet and very sensitive to alkali; dilute sodium carbonate changes the violet colour into brownish-yellow.

E. F. A.

Bile Pigments. III. Hemibilirubin and its Oxidation Products. HANS FISCHER and PAUL MEYER (*Zeitsch. physiol. Chem.*, 1911, 75, 339—349. Compare Abstr., 1911, i, 803).—Hemibilirubin has been found to exist in two forms, an acidic and a non-acidic. The latter is the pure hemibilirubin. The former, which dissolves in solutions of hydrogen carbonates with the evolution of carbon dioxide, has not yet been obtained pure.

By the reduction of bilirubin in alkaline solution by means of sodium amalgam, three products have been obtained, namely: (I) hemibilirubin, (II) the acidic form of hemibilirubin, and (III) a substance which has not yet been identified. On oxidation all three substances yield the imide of hæmatic acid, together with methylethylmaleinimide. Hæmatic acid only was found among the products of the oxidation of bilirubin.

From determinations of molecular weight, the authors draw the conclusion that the formulae previously ascribed to hemibilirubin are incorrect, and propose either $(C_{16}H_{22}O_3N_2)_2$ or $C_{33}H_{44}O_6N_4$.

H. W.

Melanin Pigments of Animal Origin. MAURICE PIETTRE (*Compt. rend.*, 1911, 163, 782—785).—The material employed in this investigation was prepared by macerating sarcomatous tumours from horses, removing the cellular debris after cooling in ice, and separating the melanin pigment by centrifugation. When submitted to alkali hydrolysis the melanin yielded alanine, together with other crystalline amino-acids, the amount of which was insufficient for identification. The residual pigment had the composition C 61.7, H 4.39, N 9.4, S 1.6, Fe₂O₃ 0.178%. Acid hydrolysis resulted in the separation of tyrosine (0.11%), leucine (2.95%), amorphous amino-acids (9.32%), and a pigment containing iron and sulphur, and having C 55.69, H 3.49, N 9.72%. The original melanin, therefore, appears to contain a protein group in union with a pigment.

W. O. W.

Action of Sulphurous Acid and of Sulphites on Various Dyes. HUGO WEIL, KARL DÜRRSCHNABEL and PAUL LANDAUER (*Ber.*, 1911, 44, 3172—3179. Compare Dürschsnabel and Weil, *Abstr.*, 1903, i, 947).—Methylene-blue is at first unchanged by sulphurous acid, but, after a time, a substance separates in small quantity in well formed yellow crystals of both basic and acid character having the composition C₃₂H₃₆O₈N₆S₅·5H₂O or 4½H₂O, corresponding with the entry of three sulpho-groups into two methylene-blue residues. Characteristic derivatives could not be obtained; oxidation with dichromate gives a blue dye; with acetic anhydride a green, hygroscopic powder is obtained.

Sodium sulphite forms leucomethylene-blue, a lustrous, bronze-coloured, crystalline intermediate product being also formed, which probably represents methylene-blue sulphite.

With sodium hydrogen sulphite the first product is a dull blue precipitate, which, after remaining three or four days or on warming, is converted into the yellow, crystalline precipitate of leucomethylene-blue-sulphonic acid, C₁₆H₁₉O₃N₃S₂·2H₂O. If the original mother liquors are allowed to evaporate at a low temperature, very soluble, lustrous, silver platelets are obtained, which instantly become blue on exposure to the air; this is regarded as a sulphaminic acid.

Sulphurous acid and nitromethylene-blue interact to form a nitro-leucomethylene-blue-sulphonic acid, C₁₆H₁₉O₃N₃S₂; this has pronounced acid properties, and forms a green dye on oxidation. The mother liquors contain basic substances, which are oxidised to blue compounds. When the nitro-leuco-acid is reduced with zinc and hydrochloric acid, the zinc salt of an aminoleuco-acid, ZnC₁₂H₂₃O₆N₃S₄, is formed; this gives a blue oxidation product.

With Meldola's-blue, sulphurous acid yields a brown, crystalline compound, C₁₈H₁₆O₄N₄S.

Phenylindamine and sodium hydrogen sulphite form lustrous, colourless plates of a substance, C₁₂H₁₃O₆N₃S₂; tolylindamine and phenyltolylindamine behave similarly, the product in each case being a leucodisulphonic acid. Phenyltetramethylindamine reacts with sodium hydrogen sulphite or sulphurous acid to form lustrous, colourless crystals of a monosulphonic acid.

Safranines are not decolorised by sulphurous acid; coloured salts

separates after a time, which appear to be a mixture of sulphite and sulphate.

E. F. A.

Action of a Mixture of Allyl Bromide and Furfuraldehyde on Magnesium: Synthesis of Furylallylcarbinol. A. SEMENTOFF and P. KONJUKOFF-DOBRYNIA (*J. Russ. Phys. Chem. Soc.*, 1911, 43, 890—992. Compare Javorsky, Abstr., 1908, i, 753).—Furylallyl-

carbinol, $\begin{array}{c} \text{CH}\cdot\text{CH}_2 \\ | \\ \text{CH}-\text{O} \end{array} \text{C}\cdot\text{CH}(\text{OH})\cdot\text{CH}_2\cdot\text{CH}\cdot\text{CH}_3$, prepared by the interaction of magnesium, allyl bromide, and furfuraldehyde, is a colourless liquid, b. p. 96—97°/31 mm., D_4^{20} 1.0424, n_D^{20} 1.49192, which rapidly turns yellow.

T. H. P.

7-Methoxy-3:4-dihydro-1:4-benzopyrone. ALEKSEI E. TSCHITSCHIBABIN and I. V. NIKITIN (*J. Russ. Phys. Chem. Soc.*, 1911, 43, 1185—1189).—7-Methoxy-3:4-dihydro-1:4-benzopyrone,

may be expected to lead to the formation of substances of the two structural formulae which are at present regarded as the most probable for brazilin (compare Werner and Pfeiffer, *Chem. Zeitsch.*, 1904, 3, 421; Perkin and Robinson, *Trans.*, 1908, i, 489; von Kostanecki and Lampe, Abstr., 1902, i, 481).

The synthesis of this compound is effected in two stages: (1) the action of the sodium derivative of *m*-methoxyphenol on sodium β -iodopropionate gives sodium β -*m*-methoxyphenoxypropionate, which (2) is converted into 7-methoxydihydrobenzopyrone by the action of phosphoric oxide. The condensation of the pyrone with veratraldehyde, which should give a compound having a structure closely related to the Pfeiffer-Perkin formula for trimethylbrazilin, is being investigated.

β -*m*-Methoxyphenoxypropionic acid, $\text{OMe}\cdot\text{C}_6\text{H}_4\cdot\text{O}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$, separates from light petroleum in flat, shining needles, m. p. 82.5°; its silver salt was analysed.

3-Methoxydihydrobenzopyrone, $\text{C}_{10}\text{H}_{10}\text{O}_3$, crystallises from water in slender, colourless needles, m. p. 55°.

T. H. P.

Synthetical Experiments in the Pyranthrone Series. ROLAND SCHOLL, JULIUS POTSCHWAUSCHKE, and JOSEF LENKO (*Monatsh.*, 1911, 32, 687—710).—Pyranthrone homologues have been prepared in which the alkyl groups are attached to the benzene nuclei between the two anthraquinone complexes. 2:2'-Diethyl-1:1'-dianthraquinonyl condenses in a similar manner to the dimethyl

compound (Scholl, Abstr., 1910, i, 271), although at a higher temperature, forming 8:16-dimethylpyranthrone (annexed formula), isomeric with 6:14-dimethylpyranthrone (Scholl, *loc. cit.*; this vol., i, 656, 676). 2:2'-Di-*n*-propyl-1:1'-dianthraquinonyl behaves similarly, but the isomeric di-*isopropyl*dianthraquinonyl did not undergo condensation. The last can only react to give an aldol-like condensation product, and

the fact that none such is formed precludes the formation of side compounds as intermediate stages in the other condensations.

To prepare the 2-alkylanthraquinones, alkylbenzenes were condensed with phthalic anhydride in presence of aluminium chloride to 4-alkylbenzophenone-3'-carboxylic acids, these reduced to benzylbenzoic acids, condensed to alkylated anthrones, and oxidised to the corresponding anthraquinones.

In addition, *n*-propylbenzoylbenzoic acid was prepared by the Grignard reaction from *p*-iodo-*n*-propylbenzene, phthalic anhydride, and magnesium; it proved to be identical with the compound obtained by means of aluminium chloride, which in this instance does not cause isomerisation of the propyl group.

2-*n*-Propylanthraquinone could not be condensed to a homologue of the anthraflavone obtained from 2-methylanthraquinone (Böhm, Abstr., 1910, i, 405).

4-Ethylbenzophenone-2'-carboxylic acid, $\text{CO}_2\text{H}\cdot\text{C}_6\text{H}_4\cdot\text{CO}\cdot\text{C}_6\text{H}_4\text{Et}$, separates in needles, m. p. 122° ; it dissolves in concentrated sulphuric acid with a yellow coloration, changing to a reddish-brown on heating.

4-Ethyl-diphenylmethane-2'-carboxylic acid, $\text{CO}_2\text{H}\cdot\text{C}_6\text{H}_4\cdot\text{CH}_2\cdot\text{C}_6\text{H}_4\text{Et}$, crystallises in colourless needles, m. p. 86° . Concentrated sulphuric acid rapidly converts it at the ordinary temperature into a mixture of 2-ethylanthrone-9 and 2-ethylanthranol-9. The desmotropic mixture consists of irregular, yellow crystals and yellow needles, m. p. $67-75^\circ$. When brominated in acetic acid and boiled with water, 2-ethylanthraquinone is obtained in yellow needles, m. p. 108° . It dissolves in sulphuric acid with a reddish-yellow coloration, becoming greenish-yellow when heated.

1-Nitro-2-ethylanthraquinone forms yellowish-brown needles or plates, m. p. 226° .

1-Amino-2-ethylanthraquinone is obtained on reduction in red needles, m. p. $153-154^\circ$.

1-Iodo-2-ethylanthraquinone crystallises in lustrous, small, yellowish-brown leaflets, m. p. 149° .

2:3'-Diethyl-1:1'-dianthraquinonyl,

prepared by heating the above iodo-compound with copper powder, crystallises in yellowish-brown prisms, m. p. 315° ; in concentrated sulphuric acid it forms a yellow solution, which becomes violet red on heating.

8:16'-Dimethylpyranthrone was obtained amorphous, m. p. much above 300° . It gives yellow solutions with a green fluorescence; the sulphuric acid solution is violet. It gives a deep violet, alkaline vat, which dyes cotton brownish-yellow.

4-*n*-Propylbenzophenone-2'-carboxylic acid,
 $\text{CO}_2\text{H}\cdot\text{C}_6\text{H}_4\cdot\text{CO}\cdot\text{C}_6\text{H}_4\cdot\text{C}_3\text{H}_7$,
crystallises in colourless needles, m. p. $125-126^\circ$.

4-*n*-Propyl-diphenylmethane-2'-carboxylic acid,
 $\text{CO}_2\text{H}\cdot\text{C}_6\text{H}_4\cdot\text{CH}_2\cdot\text{C}_6\text{H}_4\cdot\text{C}_3\text{H}_7$,
forms slender needles, m. p. $80-81^\circ$.

The mixture of 2-n-propylanthrone-9 and 2-n-propylantranol-9 is obtained in slender, yellow, microscopic needles, m. p. 60—61°, only partly soluble in dilute sodium hydroxide.

2-n-Propylanthraquinone forms yellow, slender needles, m. p. 96—99°, and dissolves in concentrated sulphuric acid with a reddish-yellow coloration.

1-Nitro-2-n-propylanthraquinone crystallises in yellow plates, m. p. 160°. 1-Amino-2-n-propylanthraquinone forms red, lancet-shaped crystals of metallic lustre, m. p. 172—173°.

1-Iodo-2-n-propylanthraquinone separates in lancet-shaped, lustrous, golden needles, m. p. 148—149°.

2:2'-Di-n-propyl-1:1'-dianthraquinonyl has m. p. 214—215°; the solution in concentrated sulphuric acid is brown, becoming dark green at about 80° and violet-red at about 220°.

8.16-Diethylpyranthrone is a yellowish-brown powder more soluble than the dimethyl homologue. The coloration with concentrated sulphuric acid is blue. It gives a deep reddish-violet alkaline vat, and dyes lighter shades than pyranthrone.

[With E. BÖCKER.]—4-isoPropylbenzophenone-2'-carboxylic acid forms lustrous, silky needles, m. p. 133—134°.

4-isoPropylthiophenylmethane-2'-carboxylic acid crystallises in platelets, m. p. 111°.

The condensation product, 2-isopropylanthrone-9, was not isolated, but converted into 2-isopropylanthraquinone, which sublimes in concentrically grouped, yellow needles, m. p. 44—45°.

1-Nitro-2-isopropylanthraquinone forms yellow plates, m. p. 210—211°. 1-Amino-2-isopropylanthraquinone separates in red platelets or in needles with a green surface reflex, m. p. 146°.

1-Iodo-2-isopropylanthraquinone crystallises in well-formed bunches of yellow needles, m. p. 133—134°.

2:2'-Di-isopropyl-1:1'-dianthraquinonyl forms rhombohedral crystals, m. p. 326°.

E. F. A.

Oxy-2-methylthiophens. MAURICE LANFRY (*Compt. rend.*, 1911, 153, 821—823).—The action of hydrogen peroxide on 2-methylthiophen is similar to that on thiophen (this vol., i, 740), and the products closely resemble those previously obtained, the oxygen being united to sulphur. Dioxy-2-methylthiophen, $C_5H_6O_2S$, has b. p. 168—170°/760 mm., D^{13}_4 1.25. Tetraoxy-2-methylthiophen, $C_5H_6O_4S$, has b. p. 187—189°/760 mm., D^{13}_4 1.37; on treatment with excess of bromine it forms tribromotetraoxy-2-methylthiophen tetrabromide, $C_5H_6O_4Br_4S$, a yellow substance, m. p. -8°, decomposing on distillation. Fuming nitric acid converts the oxymethylthiophens into an ill-defined, yellow polynitro-derivative.

Excess of hydrogen peroxide converts 2-methylthiophen into a brown, amorphous substance.

W. O. W.

Preparation of Amino- and Alkylamino substituted (in the Aryl Group) Derivatives of 3-Oxy-(1)-thionaphthen-2-carboxylic Acids and of 3-Oxy-(1)-thionaphthen. KALLE & Co. (D.R.P. 237395).—When the *N*-substitution products of arylthio-

glycol-o-carboxylic acids (such as amino, acylamino, or alkylamino-acids) are fused with alkali hydroxides at about 170°, the fumes treated with water, and oxidised with potassium ferricyanide (or air), they furnish derivatives of "thioindigo."

3-Acetylamino-6-carboxyphenylthiolacetic acid,

a yellow powder, is prepared from monoacetyl-2:4-diaminobenzoic acid by successive diazotisation, xanthogenation, and treatment with chloroacetic acid; on fusion with sodium hydroxide it yields 6-amino-3-keto-(1)-thionaphthen-2-carboxylic acid, a grey, crystalline powder, which on boiling with hydrochloric acid furnishes 6-amino-3-keto-(1)-thionaphthen, a crystalline powder, and this by oxidation is finally converted into an "aminothioindigo" derivative.

4-Acetylamino-6-carboxyphenylthiolacetic acid, prepared in a similar manner from monoacetyl-2:5-diaminobenzoic acid, successively yielded 5-amino-3-keto-(1)-thionaphthen-2-carboxylic acid, 5-amino-3-keto-(1)-thionaphthen, yellow needles, and, finally, "pp-diaminothioindigo" in black flakes.

F. M. G. M.

Anthraquinone-thioxanthone. FRITZ ULLMANN and EMMY KNECHT (*Ber.*, 1911, 44, 3125—3132. Compare *Abstr.*, 1910, i, 270).—The colour change produced by the substitution of -S- for -NH- in the anthraquinoneacridones has been studied. Generally the result is the shifting of the colour into the yellow; thus the red anthraquinone-2:1-acridone corresponds with an orange anthraquinone-2:1-thioxanthone, and the isomeric orange 1:2-acridone compound corresponds with the yellow thioxanthone derivative.

Anthraquinone-o-thiolbenzoic acids were prepared by interaction of the appropriate chloro-derivatives with o-thiolbenzoic acid, and the former condensed by means of the *p*-toluenesulphonyl chloride or phosphorus pentachloride into anthraquinone-thioxanthones.

Anthraquinone-1-o-thiolbenzoic acid, $\text{C}_6\text{H}_4 \begin{smallmatrix} \diagup \text{CO} \\ \diagdown \text{CO} \end{smallmatrix} \text{C}_6\text{H}_4 \cdot \text{S} \cdot \text{C}_6\text{H}_4 \cdot \text{CO}_2\text{H}$, crystallises in orange-yellow plates, m. p. 261° (corr.).

Anthraquinone-2:1-thioxanthone, $\text{C}_6\text{H}_4 \begin{smallmatrix} \diagup \text{CO} \\ \diagdown \text{CO} \end{smallmatrix} \text{C}_6\text{H}_2 \begin{smallmatrix} \diagup \text{S} \\ \diagdown \text{CO} \end{smallmatrix} \text{C}_6\text{H}_4$, forms lustrous, orange-red platelets, m. p. 346° (corr.). The solution in concentrated sulphuric acid is red.

Anthraquinone-2-o-thiolbenzoic acid has m. p. 278° (corr.), and not 271° as previously stated (*loc. cit.*). Anthraquinone-1:2-thioxanthone forms small, yellow needles, m. p. 278° (corr.); the azine crystallises in yellow, lustrous platelets.

1:5-Dichloroanthraquinone forms citron-yellow needles, m. p. 251° (corr.). It condenses very readily with o-thiolbenzoic acid to *anthraquinone-1:5-bis-o-thiolbenzoic acid*,

which crystallises in sealing-wax-red needles, m. p. 349° (corr.). It dissolves in alkali with an orange-red, and in concentrated sulphuric acid with a Bordeaux-red, coloration.

Anthraquinone-2:1:6:5-bisthioxanthone,

forms red, lustrous platelets, which are not melted at 360° ; they dissolve in concentrated sulphuric acid with a wine-red coloration.

1:8-Dichloroanthraquinone separates in yellow needles, m. p. 202° .

Anthraquinone-1:8-bis-o-thiolbenzoic acid forms orange-red crystals, m. p. 279° (corr.).

Anthraquinone-2:1:7:8-bisthioxanthone crystallises in Bordeaux-red, lustrous needles, giving a violet-red solution in concentrated sulphuric acid. E. F. A.

Preparation of Diglycollic Esters of Quinine. C. F. BOESINGER & SÖHNKE (D.R.P. 237450).—*Quinine diglycollate*,
 $\text{O}(\text{CH}_2\text{CO}_2\text{C}_{20}\text{H}_{23}\text{ON}_2)_2$,

is prepared by treating a chloroform solution of quinine (11 parts) with diglycollic acid (3 parts) and allowing the mixture to remain during several days. It is a voluminous, tasteless, colourless powder, m. p. 70° (about), sparingly soluble in water, readily so in organic solvents.

Quinine diglycollyl sulphate, $\text{C}_4\text{H}_4\text{O}_3(\text{C}_{20}\text{H}_{23}\text{O}_2\text{N}_2)_2 \cdot \text{H}_2\text{SO}_4 \cdot 3\text{H}_2\text{O}$, is obtained in crystalline form by treating a dichloroethylene solution of quinine with diglycollyl chloride in the same solvent and subsequently adding dilute sulphuric acid; the ester separates on the addition of sodium acetate.

The Grignard reaction with magnesium ethyl bromide, quinine, and diglycollic acid can also be employed for this preparation.

F. M. G. M.

Rearrangement of Quinine by Sulphuric Acid. BRUNO : BUTCHER and STEFANIE HOROWITZ (*Monatsh.*, 1911, 32, 793—796).—When quinine is heated at 100° with sulphuric acid, D 1.61, two bases, A and B, are formed; the former yields a soluble oxalate and sparingly soluble tartrate; the latter yields a sparingly soluble oxalate and a soluble tartrate.

Base A crystallises in needles, m. p. 193.5° (corr.), $[\alpha]_D - 237.89^\circ$; the solution in sulphuric acid fluoresces blue. The sulphate crystallises in bunches of needles, $[\alpha]_D - 234.5^\circ$.

Base B forms colourless needles, m. p. 189° (corr.), $[\alpha]_D - 181.67^\circ$; it is probably identical with Lippman's *isoquinine* (Abstr., 1892, 82).

E. F. A.

Corydalis Alkaloids. IX. Corytuberine Sub-group. JOHANNES GADAMER (*Arch. Pharm.*, 1911, 249, 503—510. Compare Abstr., 1902, i, 391; this vol., i, 483, and following abstract).—The author has undertaken with FAITZ KUNTZE a revision of the chemistry of the alkaloids forming this sub-group. The experimental results of this work, which will be published later, are discussed, and the following constitutional

formulae for bulbocapnine (I), corytuberine (II), and corydine (III) are based on them:

isocorydine differs from *corydine* (III) only in the interchange of positions between -OMe and -OH in positions 3 and 4 in the phenanthrene nucleus. These formulae are mainly based on the fact that in certain reactions these alkaloids show great similarity to *apomorphine*. (*Glaucine* is the dimethyl ether of *corytuberine* (II). The two -OH groups in *corytuberine* are regarded as occupying positions 3 and 4, because (1) this alkaloid is readily oxidised by air in alkaline solution, forming a dark green liquid. (2) The two hydroxyl groups in *apomorphine* occupy positions 3 and 4 in the phenanthrene nucleus, and the physiological action of *corytuberine* is very similar to that of *apomorphine*, whilst the characteristic emetic action disappears on methylation of these groups, as in *bulbocapnine* and *corydine*. (3) *Bulbocapnine* and *isocorydine*, like *apomorphine*, give Pellagri's reaction, so that they must contain a hydroxyl group in a position analogous to one of those in *apomorphine*, and as *isocorydine* is produced by methylation of *corytuberine*, the latter must also contain an -OH group similarly situated. *Corytuberine* itself does not give Pellagri's reaction, probably because it forms a betaine, in which the -OH group, which should function in Pellagri's reaction, is not available.

T. A. H.

Corydalis Alkaloids. X. Bulbocapnine. JOHANNES GADAMER and FRITZ KUNTZE (*Arch. Pharm.*, 1911, 249, 598-637. Compare Freund and Josephi, *Abstr.*, 1894, i, 100; Herzig and Moyer, *Abstr.*, 1898, i, 53, 389; Ziegenbein, *Abstr.*, 1897, i, 175; Gadamer, Ziegenbein, and Wagner, *Abstr.*, 1902, i, 391).—A historical résumé of work on bulbocapnine is first given, followed by a summary of the results, and analogies on which the new formula for bulbocapnine is based (preceding abstract).

In the mother liquors from the preparation of bulbocapnine, dehydrocorydaline was obtained (compare Schmidt, *Abstr.*, 1909, ii, 86). On methylation with methyl sulphate or diazomethane, bulbocapnine yields a monomethyl ether, $C_{30}H_{31}O_4N$, m. p. 130-131°, $[\alpha]_D^{20} + 247.2^\circ$ in chloroform, forming hemihedral, tetragonal crystals $[a:c=1:1.0554]$, which gives a crystalline sulphate, $B_2 \cdot H_2SO_4 \cdot 7H_2O$. On oxidation with iodine in alcohol this gives *dehydrobulbocapnine methyl ether hydriodide*, $C_{30}H_{30}O_4NI$, m. p. 228°, which with gold chloride gives the *aurichloride*, $C_{30}H_{31}O_4N \cdot HAuCl_4$, crystallising in slender, cinnamon-brown needles, and on reduction with zinc dust in dilute sulphuric acid gives *dl-bulbocapnine methyl ether*, m. p. 136°.

forming rhombic crystals [$a:b:c=0.87288:1:0.61037$]. The latter on fractional crystallisation of the *d*-acid tartrate is separated into the optically isomeric methyl ethers.

On treatment with hot acetic anhydride, bulbocapnine yields a weakly basic diacetyl derivative, $C_{19}H_{17}O_4NAC_2$, which crystallises with 1 mol. $C_6H_5\cdot OH$, a fact which explains Ziegenbein's assumption that this product is a triacetyl derivative (*loc. cit.*). On warming with potassium hydroxide in alcohol, this yields the potassium derivative of *N*-acetylbulbocapnine as a yellow, crystalline precipitate, which rapidly becomes brown in the air, and with alcohol and dilute sulphuric acid gives *N*-acetylbulbocapnine, m. p. 163–165°, crystallising in slender, red needles. With benzoyl chloride, by the Schotten-Baumann method, bulbocapnine gives a weakly basic monobenzoyl derivative, m. p. 202–203°, $[\alpha]_D^{20} + 92.7^\circ$, rhombic crystals [$a:b:c=0.59437:1:0.63116$], which forms a methiodide, m. p. 228–230° (decomp.), $[\alpha]_D^{20} + 28.1^\circ$, crystallising in rosettes of needles or silky leaves, and on oxidation with iodine in alcohol gives benzoyl-dehydrobulbocapnine hydriodide, m. p. 219° (decomp.), $[\alpha]_D^{20}=0^\circ$. The latter on reduction with zinc dust and sulphuric acid gives dl-mono-benzoylbulbocapnine, m. p. 201–202°, and this on hydrolysis yields dl-bulbocapnine, m. p. 209–210°, which can be separated into its optical isomerides by crystallisation of the *d*-acid tartrate. With hot benzoyl chloride, bulbocapnine gives a dibenzoyl derivative, m. p. 156–157°, $[\alpha]_D^{20}=0^\circ$, which on treatment with sodium hydroxide in methyl alcohol yields *N*-benzoylbulbocapnine, m. p. 160°. Oxidation of dibenzoylbulbocapnine with chromic acid did not give a crystalline quinonoid derivative such as is obtained with tribenzoylapomorphine, although the red substance produced is probably a quinone.

With methyl iodide, bulbocapnine gives a methiodide (Freund and Josephi and Ziegenbein, *loc. cit.*), $[\alpha]_D^{20} + 173.8^\circ$ in alcohol, and the methyl ether on treatment with methyl iodide yields bulbocapnine methyl ether methiodide, $C_{20}H_{21}O_4N\cdot MeI$, m. p. 245–247°, $[\alpha]_D^{20} + 163.7^\circ$.

Dimethylbulbocapnimethine, $C_{17}H_{15}O_4\cdot CH_2\cdot CH_2\cdot NMe_2$, best obtained by the method described by Pschorr for the analogous apomorphine compound (Abstr., 1906, i, 878), is a viscid, yellow liquid and is optically inactive; it furnishes an unstable methiodide,

and a methosulphate, crystallising in thick, yellow needles. Either of these on warming with sodium hydroxide in methyl alcohol furnishes 3:4-dimethoxy-5:6-methylenedioxy-8-vinylphenanthrene, m. p. 101°, crystallising from ether in small, yellow needles. This on distillation with zinc dust gives ethylphenanthrene, which could not be obtained pure, but furnished a picrate, m. p. 138–140° (compare Pschorr, Abstr., 1906, i, 178), and on oxidation with permanganate in acetone yields the corresponding 3:4-dimethoxy-5:6-methylenedioxy-phenanthrene-8-carboxylic acid, m. p. 228°, which crystallises in slightly red needles. The latter on further oxidation with permanganate in water gives (1) a soft mass, and (2) a substance, m. p. 247°, crystallising in red needles, which is probably diethoxymethylenedioxyphenanthraquinonecarboxylic acid; it dissolved in alkalis,

forming eventually a colourless solution, from which acids liberate a colourless substance, m. p. 256—257°, which gradually becomes yellow on exposure to light. The soft mass referred to above, on solution in alcohol, deposits after a time a crystalline substance, m. p. 269°.

T. A. H.

Alkaloids of Ipecacuanha Root. OSKAR KELLER (*Arch. Pharm.*, 1911, 249, 512—524. Compare Paul and Cowley, *Abstr.*, 1896, i, 192; Frerichs and Tapir, *Abstr.*, 1902, ii, 711).—The bark of the root was extracted with ether, then moistened with ammonia solution, and re-extracted with ether and finally with chloroform. The first operation gave no alkaloid. The second furnished cephaeline and emetine, and the third psychotrine. Cephaeline crystallised from the second ethereal extract on concentration, and emetine was recovered from the mother liquors. Carthagena root yielded more cephaeline than Rio root. The colour reactions of both alkaloids are given (compare Allen and Scott-Smith, *Abstr.*, 1903, ii, 117), and the dilutions at which they cease to be precipitated by the usual reagents.

Cephaeline softens at 93°, melts at 104—105°, and is readily soluble in alcohol or chloroform, less so in ether or light petroleum.

Emetine, $C_{20}H_{44}O_4N_2$, was obtained as a snow-white, amorphous powder; the hydrochloride, $B, 2HCl, 3H_2O$, crystallised in groups of needles and melted indefinitely, the hydrobromide, $B, 2HBr$, in minute needles, and the hydriodide, $B, 2HI, 2H_2O$, m. p. 228—230°, in small masses of needles; the platinichloride, m. p. 248—249°, is amorphous. Emetine furnishes a dibenzoyl derivative, m. p. 96—106°, in which one benzoyl group is probably attached to a second nitrogen atom. It contains two methoxyl groups, and on heating with methyl iodide and sodium hydroxide forms a methyl dimethiodide, so that it appears to contain both a secondary and a tertiary nitrogen atom.

T. A. H.

Methyl Ether of Codeine and its Behaviour on Exhaustive Methylation. Morphine. XII. LUDWIG KNORR and PAUL ROTH (*Ber.*, 1911, 44, 2754—2758).—When α -chlorocodeide is heated in an autoclave for two days at 100—110° with sodium methoxide in methyl alcoholic solution, codeine methyl ether is formed, and can be isolated as hydrochloride, $C_{18}H_{25}O_3N, HCl$, which crystallises (with $\frac{1}{2}$ mol. of alcohol) in needles, m. p. about 285° (previously sintering); $[\alpha]_D^{20} - 66^\circ$ (in water). The hydriodide, $C_{18}H_{25}O_3N, HI$, crystallises in rosettes of needles, m. p. about 238—240° (decomp.). The sulphate (m. p. 241°), and the nitrate (which decomposes at 219°) also crystallise well. Codeine methyl ether, obtained from its salts, is a well crystalline substance, m. p. 137°, $[\alpha]_D^{25} - 80^\circ$ (in alcohol, $c = 1.965$). The methiodide, $C_{18}H_{25}O_3N, MeI$, crystallises in compact prisms, m. p. 270° (decomp.).

The methiodide, when boiled with sodium hydroxide, yields quantitatively a methine base, which is not crystalline; it suffers no rearrangement when heated with alcoholic potassium hydroxide (com-

see Knorr, H \ddot{u} rl \ddot{u} lein, and Grimme, Abstr., 1907, i, 956). The *hydriodide* (methylmorphimethine methyl ether hydriodide), $C_{10}H_{12}O_2N\cdot HI$,

crystallises in needles or plates, m. p. about 204–208° (sintering from 200°), $(n_D^{20} = 1.4035)$ or -87.3° ($c = 1.4950$). The *methiodide*, $C_{10}H_{12}O_2N\cdot MeI$, forms feathery crystals, m. p. 275°.

Methylmorphimethine methyl ether methiodide was deprived of iodine by means of silver oxide, and the resulting quaternary base was heated at 150° in a stream of hydrogen. Complete decomposition took place, and the following products were isolated and identified: ethylene, methylmorphenol, methyl alcohol, trimethylamine. R. V. S.

Preparation of 1-Aryl, Alkyl, or Alkylaryl Substituted Hydrastines. FARBENFABRIKEN VORM. FRIEDR. BAYER & Co. (D.R.P. 235358. Compare Abstr., 1902, i, 901; this vol., i, 906).—When *N*-acyl derivatives of homopiperonylamines are submitted to the action of condensing agents, they furnish hydrastinine derivatives. When *acetylhomopiperonylamine*, $CH_2\cdot O_2\cdot C_6H_5\cdot CH_2\cdot CH_2\cdot NHAc$,

colourless leaflets, m. p. 101°, is boiled with phosphoric oxide in toluene solution, it yields 6:7-methylenedioxy-1-methyl-3:4-dihydroisoquinoline; its *picrate*, a yellow, crystalline powder, has m. p. 232°; and the *methiodide*, yellow leaflets, m. p. 257°; when shaken during several hours with freshly precipitated silver chloride, it furnishes 1-methylhydrastinine hydrochloride (formula I), feathery needles, m. p. 232°.

When the foregoing isoquinoline derivative is treated with benzyl chloride it yields 2-chloro-6:7-methylenedioxy-2-benzyl-1-methyl-3:4-dihydroisoquinoline (formula II), yellowish-brown needles, m. p. 248°.

Phenacetylhomopiperonylamine, $CH_2\cdot O_2\cdot C_6H_5\cdot [CH_2]_6\cdot NH\cdot CO\cdot CH_2Ph$, yellow needles, m. p. 96°, under similar treatment yields 6:7-methylene-

dioxy-1-benzyl-3:4-dihydroisoquinoline, a yellow, oily liquid, b. p. 240°/16 mm.; its *picrate*, yellow crystals, has m. p. 189–190°, and the *methiodide*, yellow needles, m. p. 252°, on treatment with silver chloride furnishes 1-benzylhydrastinine hydrochloride (or methochloride), an uncrystallisable resin, readily soluble in water.

6:7-Methylenedioxy-1-benzyl-3:4-dihydroisoquinoline *ethiodide* (formula III) forms yellow crystals, m. p. 214°.

Benzylhomopiperonylamine, m. p. 122°, yields 6:7-methylenedioxy-1-phenyl-3:4-dihydroisoquinoline, colourless crystals, m. p. 142–143°; its *methiodide*, yellow needles, has m. p. 241°.

F. M. G. M.

Strychnine and Brucine. [III.] ROBERTO CIURA and G. SCAGLIARINI (*Atti R. Accad. Lincei*, 1911, [v], 20, ii, 201—206. Compare Abstr., 1910, i, 583; this vol., i, 155).—By the action of bromine on strychnine, under the conditions employed by Lösslich and Schoop (Abstr., 1886, 267), the authors obtained a monobromostrychnine, m. p. 222—223°, identical with that formerly described by them; they consider, therefore, that the β -monobromostrychnine of Lösslich and Schoop does not exist.

When treated with bromine in glacial acetic acid, brucine yields a *perbromide*, $C_{23}H_{16}O_4N_2Br_2 \cdot H_2O$, crystallising in yellowish-white needles, which do not melt at 270°. From it a *monobromostrychnine platinumchloride*, $(C_{23}H_{15}O_4N_2Br)_2 \cdot H_2PtCl_6 \cdot H_2O$, can be obtained.

On treating strychnine with potassium chlorate and hydrochloric acid in the cold, the tetrachlorostrychnine of Minunni and Ortolana (Abstr., 1900, i, 309) is produced, together with an amorphous, isomeric *tetrachlorostrychnine*, $C_{23}H_{12}O_2N_2Cl_4 \cdot HCl \cdot 3H_2O$. When the cooling is omitted in the above reaction, an *octachlorostrychnine* is obtained as a yellowish-white, crystalline powder, which on analysis gives numbers corresponding approximately with the formula

It yields a *p*-nitrophenylhydrazone, to which the formula

is ascribed.

The physiological action of the derivatives now and previously described has also been studied. The two dibromides, m. p. 122 and 260°, bromostrychnine, and the corresponding dibromide are as toxic as strychnine itself, whilst the octachlorostrychnine (like Minunni's tetrachlorostrychnine) and the acid, $C_{19}H_{22}O_6N_2$, are not toxic. R. V. S.

Iodine Derivatives of Strychnine, Brucine, and Some Other Alkaloids. L. KRAUZE (*Bull. Acad. Sci. Cracow*, 1911, [4], 6, 355—368).—True periodides of strychnine has been obtained by Butaczewski and Kozniewski (Abstr., 1908, i, 1007) and Kozniewski (Abstr., 1909, i, 826).

When more iodine is used, under otherwise similar experimental conditions, two modifications of a *strychnine heptaiodide*,

are formed. One of these is obtained from solutions containing 10% excess of iodine in brownish-needles with a golden lustre, m. p. 151°; it soon decomposes when kept. The other is formed when considerably more iodine is used; it separates in hard, black prisms of a steel-like lustre, m. p. 176—177°, which are stable when kept. Both forms when warmed with alcohol or acetone are converted into Jørgensen's tri-iodide (*J. pr. Chem.*, 1870, [ii], 2, 1334).

By the action of an alcoholic iodine solution on di-iodostrychnine, a brown product is obtained containing more than three iodine atoms, which is a mixture, and could not be obtained crystalline. On warming with acetone, it becomes yellow, forming a new insoluble

diiodostrychnine. Strychnine evidently tends to form several isomeric diiodides, a property entirely lacking in brucine.

Buraczewski and Dziursynski (Abstr., 1910, i, 873) have shown that complicated reactions take place on boiling diiodostrychnine in acetone; two non-poisonous, crystalline products were obtained. These have now been studied more fully. The one forms small, silky needles, m. p. 281° , $C_{21}H_{22}O_2N_2I_2 \cdot 1\frac{1}{2}H_2O$, the other yields hard prisms, m. p. 271° , $C_{24}H_{23}O_2N_2I_2 \cdot 1H_2O$.

The former, *iodoacetylstrychnine*, $C_{21}H_{22}O_2N_2 \cdot CH_2 \cdot COMe$, does not interact with acids or alkalis; with moist silver oxide a soluble, easily decomposed base is obtained; it reduces Fehling's solution and forms a *phenylhydrazone*, which is not well characterised. The *picrate* forms lustrous, yellow, silky needles; the *dichromate* is yellow and flocculent. It is optically inactive and does not react with methyl iodide.

The second substance, *iodoacetylstrychnic acid*,
 $NH \cdot C_{20}H_{22}O(CO_2H) \cdot NI \cdot CH_2 \cdot COMe$,

when dried in a vacuum loses half a molecule of water, forming an *anhydro acid*, $(C_{20}H_{22}O_2N_2)_2O$. It forms salts with salts of the heavy metals; with potassium dichromate a yellow, flocculent precipitate, $(C_{20}H_{22}O_2N_2)_2Cr_2O_7$, is obtained. The *picrate*, $C_{20}H_{21}O_{11}N_5$, is yellow. It reduces Fehling's solution, and forms a *phenylhydrazone*, m. p. 124° . With sodium nitrite in acid solution a crystalline precipitate of the nitrosamine sulphate is formed.

With alkaline methyl-alcoholic methyl iodide, *iodoacetyl-N-methylstrychnic acid*, $C_{23}H_{21}O_4N_2I$, is obtained; it crystallises in needles, m. p. 248° .

Analogous compounds could not be obtained from other alkaloids. Diiodobrucine and acetone interact to give a *periodide*,

crystallising in short, hard, brownish-red columns, m. p. 260° .

From diiodocinchonine or diiodoquinidine and acetone, the hydriodides of the bases were obtained. E. F. A.

Reduction Catalysts. V. Hydrogenation of Alkaloids.

VLADAR SKITA and H. H. FRANCK (*Ber.*, 1911, 44, 2862—2867).—Strychnine in dilute acetic acid containing a little 1% palladium chloride and 1% gum arabic is reduced in hydrogen under a pressure of 2 atmospheres at the ordinary temperature to *dihydrostrychnine*, $C_{21}H_{24}O_2N_2$, m. p. $209-210^{\circ}$, whilst brucine is converted into *dihydrobrucine*, $C_{22}H_{26}O_4N_2$, m. p. 115° , under similar conditions; under a pressure of 3 atmospheres at 70° , dihydrostrychnine is reduced further to Tafel's tetrahydrostrychnine.

In hydrochloric acid solution containing a little palladium chloride or platonic chlorido, morphine, codeine, quinine, and cinchonine are reduced by hydrogen to dihydromorphine (Oldenberg, this vol., i, 668), *dihydrocodeine*, $C_{18}H_{23}O_3N$, m. p. 65° , dihydroquinine, and dihydrocinchonine respectively, whilst piperine is converted into *tetrahydropiperine*, b. p. $261^{\circ}/14$ mm. These last reductions are not effected by the colloidal metal.

C. S.

Strychnine Alkaloids. XII. Derivatives of Bisapomethylbrucine. HERMANN LEUCHS and RUDOLPH ANDERSON (*Ber.*, 1911, 44, 3040—3049. Compare this vol., i, 746).—The nitrate,

$C_{21}H_{21}O_4N_3.HNO_3.1\frac{1}{2}H_2O$,
hydrobromide, $C_{21}H_{21}O_4N_3.HBr.2H_2O$, zincchloride,

$C_{21}H_{21}O_4N_3.H_2ZnCl_4.H_2O$,
diacetyl derivative, $C_{23}H_{23}O_6N_3$, m. p. 232—233°, and the methiodide, m. p. 280° (decomp.), of bisapomethylbrucine are described. The action of concentrated nitric acid at -5° on bisapomethylbrucine yields nitrobisapomethyldehydrobrucine nitrate,

$C_{21}H_{19}O_6N_3.HNO_3.3H_2O$,
orange needles, which is converted by warm 10% nitric acid into cacotheline. The latter is obtained directly by warming bisapomethylbrucine hydrochloride with 10% nitric acid.

An attempt to regenerate brucine from bisapomethylbrucine by means of methyl iodide failed. However, with a large excess of methyl sulphate, bisapomethylbrucine hydrochloride in alkaline solution yields *brucine methosulphate*, $C_{23}H_{23}O_5N_3.Me_2SO.2\frac{1}{2}H_2O$, m. p. 268° (decomp.), which crystallises in three forms, has a very bitter taste, and responds to the red brucine reaction. This substance, which is identical with that obtained from methyl sulphate and brucine itself, is converted by warm aqueous sodium hydroxide into methylbrucine, the acetyl derivative of which has m. p. 157—158° after strongly sintering at about 120° and resolidifying. When boiled with 10% nitric acid, methylbrucine yields cacotheline methosulphate, $C_{23}H_{23}O_5N_3.Me_2SO.2H_2O$, orange plates, which carbonise at about 280°. C. S.

Strychnine Alkaloids. XIII. Isolation of a Four Brucinesulphonic Acid. HERMANN LEUCHS and WALTER GUICH (*Ber.*, 1911, 44, 3019—3051).—When brucine is sulphated with manganese dioxide and sulphurous acid in the manner described previously (*Abstr.*, 1908, i, 563; 1909, i, 120, 253, 602, 671), and the resulting sulphonic acids are extracted with water, a very small amount (3%) of a very sparingly soluble *brucinesulphonic acid*, $C_{23}H_{23}O_5N_3S.4H_2O$, is left undissolved. This acid crystallises in large, truncated prisms, has $[\alpha]_D^{20} -122.2^\circ$ in *N*/10-alkali, and is soluble in 170 parts of boiling water. C. S.

Tetrahydropiperine and Tetrahydropiperic Acid. WALTER BORSCHKE (*Ber.*, 1911, 44, 2942—2945. Compare this vol., i, 850).— β -Styrylacrylic acid is readily reduced by palladium and hydrogen to β -phenylvaleric acid, and the same method applied to piperine furnishes a quantitative yield of tetrahydropiperine, which on hydrolysis gives piperidine and tetrahydropiperic acid. The latter crystallises from dilute alcohol in colourless leaflets, m. p. 100—101° (compare Buri, *Abstr.*, 1883, 485). The methyl ester, b. p. 193—195° is a colourless, odourless oil. The acid chloride is a mobile oil, and on distillation decomposes, giving (1) a brown, resinous residue, which evolves hydrogen chloride, and (2) a viscid, colourless liquid, which deposits crystals. The amide, m. p. 110°, prepared from the chlorid

crystalline in glancing leaflets. The chloride on treatment with lithium chloride in carbon disulphide gives *methylendioxydimethylenes*, $\text{CH}_2-\text{CH}_2-\text{CH}_2-\text{CH}_2-\text{CO}-\text{C}_6\text{H}_4-\text{O}-\text{CH}_2-\text{CH}_2-\text{CH}_2-\text{CH}_2$, as a nearly colourless oil, melting at $238-239^\circ$ (decomp.), crystallising in small, colourless needles. T. A. H.

Synthesis of 2:4-Dimethyl-3-ethylpyrrole, a Contribution to the Question of the Constitution of Hæmopyrrole. LUDWIG SOSS and KURT HESS (*Ber.*, 1911, 44, 2758-2767).—According to Pictet (this vol., i, 92), hæmopyrrole is 2:4-dimethyl-3-ethylpyrrole, whilst phenopyrrole is 2:3-dimethyl-4-ethylpyrrole, but the synthesis of these substances has not yet been accomplished. The present authors have prepared 2:4-dimethyl-3-ethylpyrrole from 3-acetyl-2:4-dimethylpyrrole, obtained from the ethyl carboxylate produced by combination of nitrosoacetoacetic ester with acetylacetone. The synthetic product is similar to, but not identical with, hæmopyrrole, which must be 2:3-dimethyl-4-ethylpyrrole, therefore, in view of Pictet's work. The identity of 2:4-dimethyl-3-ethylpyrrole with phenopyrrole remains to be established, owing to the lack of crystalline derivatives of the latter substance. 2:3:5-Trimethylpyrrole (compare Ciamician and Dennstedt, *Ber.*, 1881, 14, 1340), 2:5-dimethyl-3-ethylpyrrole, and 2:5-dimethyl-3-propylpyrrole are also described.

The preparation of the pyrrole derivatives from the oximinoketones and acetoacetic ester was effected by the method formerly described (Knorr, *Abstr.*, 1887, 275). The saponification of the arboxylic esters was carried out with 10% alcoholic sodium hydroxide containing a little water. On heating, the carboxylic acids lose carbon dioxide, the reaction being conducted in an atmosphere of nitrogen or hydrogen.

Ethyl 2:3:5-trimethylpyrrole-4-carboxylate, $\text{C}_{10}\text{H}_{15}\text{O}_2\text{N}$ (by reduction of methyl oximinopropyl ketone and acetoacetic ester), crystallises as small needles, m. p. $104-105^\circ$. The acid, $\text{C}_8\text{H}_{11}\text{O}_2\text{N}$, decomposes at 198° . 2:3:5-Trimethylpyrrole, $\text{C}_7\text{H}_{11}\text{N}$, has b. p. $180-181^\circ/54$ mm. (corr.).

Ethyl 2:5-dimethyl-3-ethylpyrrole-4-carboxylate, $\text{C}_{11}\text{H}_{17}\text{O}_2\text{N}$ (from ethyl oximinopropyl ketone and acetoacetic ester), crystallises in small needles, m. p. $106-107^\circ$. The acid, $\text{C}_9\text{H}_{13}\text{O}_2\text{N}$, decomposes at about 200° . 2:5-Dimethyl-3-ethylpyrrole, $\text{C}_8\text{H}_{13}\text{N}$, has b. p. $137-138^\circ/759$ mm. (corr.), $93-94^\circ/21$ mm. It shows the pine-needle reaction, and gives a white precipitate with mercuric chloride, it differs from its isomerides in having an odour reminiscent of chloroform, and in being much less sensitive to oxygen.

Ethyl 2:5-dimethyl-3-propylpyrrole-4-carboxylate, $\text{C}_{12}\text{H}_{19}\text{O}_2\text{N}$ (from nitrosobutyl methyl ketone, which has m. p. 60° , and acetoacetic ester), forms prismatic crystals, m. p. 110° . The acid, $\text{C}_{10}\text{H}_{15}\text{O}_2\text{N}$, has m. p. about 210° (decomp.). 2:5-Dimethyl-3-propylpyrrole, $\text{C}_9\text{H}_{15}\text{N}$, has b. p. $206-207^\circ/760$ mm.

For the preparation of 2:4-dimethyl-3-ethylpyrrole another method is to be devised, advantage being taken of the fact (L. Wolff,

unpublished) that hydrazones can be reduced to hydrocarbons by sodium ethoxide. 3-Acetyl-2:4-dimethylpyrrolehydrazones (compare Knorr and Lange, Abstr., 1902, i, 821), $C_8H_{11}N_2$, forms rhombic crystals, m. p. 178—179°. When this substance is heated with an alcoholic solution of sodium ethoxide for fourteen hours at 150—160° in a sealed tube filled with nitrogen, 2:4-dimethyl-3-ethylpyrrole is produced, and is isolated by distillation in steam, saturation of the distillate with ammonium sulphate, and extraction with ether, the being taken to conduct all the operations in an atmosphere of hydrogen. The distillation of the substance is carried out as indicated by Elias (loc. cit.) for hæmopyrrole. 2:4-Dimethyl-3-ethylpyrrole, $C_{10}H_{13}N$, b. p. 96°/16 mm., 107°/27 mm., 118°/37 mm. It behaves like hæmopyrrole towards nitrous acid, yielding methylethylmaleimide, but is not fluorescent, and yields a *picrate* which forms compact crystals, m. p. 131—132° (hæmopyrrole picrate has m. p. 108°).

R. V. S.

Products from Pyrrole-2-carboxylic Acid. EMIL FISCHER and DONALD D. VAN SLYKE (*Ber.*, 1911, 44, 3166—3171).—Pyrrole-2-carboxylic acid, in spite of the sensitiveness of the pyrrole ring to acids, is relatively easily converted into the chloride by phosphorus pentachloride. The chloride affords a convenient material for the preparation of the ester, amide, and anilide of the acid; it has also been coupled with glycine to form 2-pyrrolylglycine,

Pyrrole-2-carboxylic acid shows a very marked red coloration in aqueous or alcoholic solution with ferric chloride, and resembles in this respect the phenolcarboxylic acids.

α-Pyrrolecarboxyl chloride, $C_4H_4N\cdot\text{COCl}$, crystallises in long, yellow needles, aggregated in bunches, m. p. about 90°. When carefully purified, it forms very long, colourless crystals, which sinter at 119° and subsequently blacken without melting.

Pyrrole-2-carbanilide, prepared by interaction of pyrrolecarboxyl chloride and aniline in ethereal solution, forms colourless, long and much intergrown prisms, m. p. 153—154° (corr.) after previous sintering.

α-Pyrrolylglycine ethyl ester crystallises in six-sided platelets, m. p. 118° (corr.). *α*-Pyrrolylglycine forms small, spindle-shaped crystals, m. p. 167° (corr.). It gives no coloration with ferric chloride.

E. F. A.

Action of Ammonia on Benzoyldehydracetic Acid. PAUL IW. PETRENKO-KRITSCHENKO and JOH. SCHÖTTLE (*Ber.*, 1911, 44, 2826—2830).—Feist's so-called 2:6-diphenyl-4-pyridone, obtained from benzoyldehydracetic acid and ammonia (Abstr., 1891, 45, 252), not identical with the author's compound of the same name (Abstr., 1909, i, 605), and is proved to be probably the *lactam*,

of benzoyldehydracetic acid by analysis, and by the fact that it is

converted by alcoholic potassium hydroxide into 2:6-diphenyl-4-pyridone-3-carboxylic acid, $\text{NH} \begin{smallmatrix} \text{CPh}=\text{CH} \\ \text{CPh:C(CO}_2\text{H)} \end{smallmatrix} \text{CO}$, which yields 2:6-diphenyl-4-pyridone (m. p. 176—178°) at its m. p. 243—245°. Feist's compound, which can also be converted into 2:6-diphenylpyridone hydrochloride by concentrated hydrochloric acid at 180°, is obtained from benzoyldehydracetic acid and alcoholic ammonia even at the ordinary temperature in two to three days (compare Feist, *loc. cit.*). C. S.

Toluyl- and Xyloyl-picolinic Acids. OTTOKAR HALLA (*Monatsh.*, 1911, 32, 747—751).—Just (Abstr., 1898, i, 42) has obtained *p*-toluoylpicolinic acid by the condensation of quinolinic anhydride with toluene in presence of aluminium chloride. Quinolinic acid forms an exception to Kirpal's rule that two isomeric ketonic acids are formed in this reaction, as he only obtained 3-benzoylpicolinic acid on condensing it with benzene.

It is now found that when condensed with toluene, 3-*p*-toluoylpicolinic acid, m. p. 169°, is the main product, but that traces of a compound, m. p. 150°, are also formed; this has not been investigated. The 3-*p*-tolyl pyridyl ketone obtained by Just on heating 3-*p*-toluoylpicolinic acid at its melting point, has been synthesised from nicotinyll chloride and toluene; this establishes the formula of the 3-*p*-toluoylpicolinic acid, which has also been synthesised from quinolinic acid ethyl ester chloride and toluene.

3-(m:4)-Xyloylpicolinic acid, prepared in a similar manner from xylene, has m. p. 142°. On heating, β -m:4-xylyl pyridyl ketone is obtained, identical with that prepared from nicotinyll chloride and xylene; it is a faintly yellow-coloured oil, b. p. 240°, and forms a *perale*, crystallising in yellow plates, m. p. 134°. E. F. A.

Aldehydes of Oxindole, Indoxyl, and Hydroxythionaphthen. PAUL FRIEDLÄNDER and ST. KIELBASINSKI (*Ber.*, 1911, 44, 3098—3108).—Friedländer and Schwenk (Abstr., 1910, i, 592) have shown that indigotin is decomposed by potassium hydroxide at 150° into anthranilic acid and indoxylaldehyde. In a similar manner the isomeric oxindolealdehyde, $\text{C}_8\text{H}_4 \begin{smallmatrix} \text{C(CHO)} \\ \text{NH} \end{smallmatrix} \text{C}\cdot\text{OH}$, is obtained from "thioindigoscarlet R," whilst the dye prepared by condensing hydroxythionaphthen with *N*-methylsatin yields a *N*-methyl derivative of oxindolealdehyde, $\text{C}_8\text{H}_4 \begin{smallmatrix} \text{C(CHO)} \\ \text{NMe} \end{smallmatrix} \text{C}\cdot\text{OH}$. All three compounds show the normal aldehyde reactions.

Indoxylaldehyde, however, behaves abnormally towards mineral acids, which on moderate warming convert it into an intense violet dye; this dissolves in alkalis with a bluish-green coloration.

3-Indoxyl-2-thionaphthen-2'-one (Abstr., 1908, i, 673) is decomposed by alkali to 3-hydroxythionaphthen-2-aldehyde,

this is converted quantitatively by dilute acids into a red dye dis-

solving in alkali with a bluish-violet coloration. This dye is also formed from equal molecules of hydroxythionaphthen and hydroxythionaphthaldehyde, and has the constitution

The same dye is formed from hydroxythionaphthen under a variety of conditions; for example, by the action of air on the strongly alkaline solution, particularly in presence of formaldehyde or other aliphatic aldehyde. It is also formed on heating carboxyphenylsulphoxide-acetic acid, $\text{CO}_2\text{H} \cdot \text{C}_6\text{H}_4 \cdot \text{SO} \cdot \text{CH}_2 \cdot \text{CO}_2\text{H}$, in anhydrous potassium sodium acetate at $160-170^\circ$.

It is probable that the dye formation from indoxylaldehyde is similar in character, and that it may be formulated as

Other analogous hydroxyaldehydes, for example, indandionealdehyde, $\text{C}_6\text{H}_4 \begin{array}{c} \text{C(OH)} \\ \diagup \quad \diagdown \\ \text{CO} \end{array} \text{C} \cdot \text{CHO}$, behave similarly towards acids.

The 3-aldehydes of oxindole and 2-hydroxythionaphthen are likewise sensitive towards mineral acids; the latter,

is prepared by the action of potassium hydroxide on 2'-indoxyl-3-thionaphthen-2-one (*loc. cit.*).

Oxidole-3-aldehyde crystallises in faintly yellow-coloured needles, m. p. 213° ; the aqueous solution is turned dark blue by ferric chloride. The sodium salt forms light grey crystals. The *phenylhydrazones* separates in stellar aggregates of pale yellow needles, m. p. 210° . The *aldazines* forms orange-yellow needles, m. p. 239° . The *oximes* forms corny crystals, m. p. 150° ; its hydrochloride and sulphate crystallise well. The *anil* crystallises in yellow needles, m. p. 245° (decomp.). Analogous sparingly soluble anils are formed with *benzidine*, yellow needles, m. p. 300° , *p-toluidine*, greenish-yellow plates, m. p. 173° , *m-aminobenzoic acid*, yellow needles, m. p. above 290° , *p-phenylenediamine*, yellow plates, m. p. above 300° .

1-Methyloxindole-3-aldehyde crystallises in pale yellow needles, m. p. 186° ; the sodium salt is sparingly soluble. The following derivatives are described: *phenylhydrazone*, broad, pale yellow needles, m. p. 193° ; *oxime*, small, yellow, indefinitely formed needles, m. p. 111° ; *aldazine*, orange-yellow needles, m. p. 211° ; *anil*, pale yellow needles, m. p. 141° ; *benzidine* derivative, greenish-yellow needles, m. p. 218° ; *p-toluidine* derivative, well-formed, yellow needles, m. p. 150° ; *m-aminobenzoic acid* derivative, yellow needles, m. p. 296° ; *p-phenylenediamine* compound, orange-yellow needles, m. p. 210° (decomp.).

Indoxyl-2-aldehyde, m. p. 145° , forms a *phenylhydrazone*, crystallising in yellow needles, m. p. 116° (decomp.); the *aldazine* forms small, orange-red needles, decomp. above 150° ; the *anil* gives orange-yellow needles, m. p. 195° (decomp.).

3-Hydroxythionaphthen-2-aldehyde crystallises in yellow needles, m. p. 107° , and gives a dark olive-green coloration with ferric chloride. The *phenylhydrazones* crystallises in broad, golden-yellow needles,

m. p. 137°. The dye, $C_{17}H_{10}O_4S_2$, obtained on warming with 5% sulphuric acid crystallises in large, red needles; the sodium salt forms lustrous, gold platelets. The corresponding dye, $C_{17}H_9O_4S_2Cl$, obtained on condensing hydroxythionaphthaldehyde with 6-chlorohydroxythionaphthen, is very similar, crystallising in slender, red needles.

3. *Hydroxythionaphthen-3-aldehyde* crystallises in colourless needles, m. p. 126–127°; it gives a dark blue coloration with ferric chloride. The alizarine forms slender, yellow needles, m. p. 203°; with anthranilic acid a yellow, crystalline precipitate, m. p. 249°, of the azomethine is obtained.

E. F. A.

Cyclic Ammonium Bases. HERMAN DECKER and ADOLF KAUFMANN (*J. pr. Chem.*, 1911, [ii], 84, 425–448. Compare this vol., i, 207).—An aqueous solution of isoquinoline methiodide, when treated with potassium hydroxide and shaken with benzene, yields the corresponding carbinol base (1-hydroxy-2-methyldihydroisoquinoline). By shaking the benzene solution with water, the greater part of the carbinol base may be extracted in the form of the ammonium base (2-methylisoquinolinium hydroxide), the amount of which may be determined by titration with hydrochloric acid. The dilute aqueous solutions thus obtained are strongly alkaline, precipitate metallic hydroxides, and show all the characteristic properties of aqueous solutions of aliphatic ammonium bases. In contrast to the carbinol base, which undergoes atmospheric oxidation very readily, the ammonium base is very stable, its aqueous solutions showing no change even on exposure to air for seventy-two hours. Dilute aqueous solutions of the ammonium base, when shaken with benzene, yield no appreciable amount of the carbinol base; on the addition of sodium hydroxide, however, considerable quantities of the carbinol base may be extracted.

From these observations the conclusion is drawn that in aqueous solution there exists an equilibrium between the ammonium and carbinol bases: $C_8H_7 \begin{smallmatrix} \text{CH}:\text{CH} \\ \text{CH}:\text{NMe}_3\text{-OH} \end{smallmatrix} \rightleftharpoons C_8H_7 \begin{smallmatrix} \text{CH}=\text{CH} \\ \text{CH}(\text{OH})\text{-NMe}_3 \end{smallmatrix}$; in dilute solution the amount of the latter base is very small, but increases on the addition of an alkali hydroxide.

3. *Methylisoquinolinium picrate*, $C_{16}H_{12}O_7N_4$, crystallises in long, slender, yellow needles, sintering at 183°, m. p. 187°.

Similar experiments were carried out with quinoline methiodide, but no evidence of the transformation of the carbinol base into the corresponding ammonium base was obtained.

[With MATTHEW SASSE and WASLAW WISLOKI].—Addition of aqueous sodium hydroxide to pyridine methiodide yields a solution, which resembles in its behaviour that obtained from an aliphatic quaternary ammonium salt, and it has therefore been assumed (Hantzsch and Kalb, *Abstr.*, 1900, i, 113) that the base is present in solution wholly in the ammonium form. The ready oxidation of such a solution to 1-methylpyridone (Decker, *Abstr.*, 1893, i, 279) is, however, in contradiction to this view, but is readily explicable on the assumption that there exists in aqueous solution an equilibrium between the ammonium and carbinol bases, the amount of the latter being very small in com-

parison with that of the ammonium base. On oxidation, the carbinol base is continuously removed, and the equilibrium thereby displaced until the whole of the ammonium base is converted into 1-methylpyridone.

Reasons are given in favour of the annexed formula for the compound obtained by Weil (Abstr., 1902, i, 677) by the action of alkalis on trimethylquinolide methiodide.

1-Alkylpyridones are readily prepared by oxidising 1-alkylpyridinium halides with potassium ferricyanide in aqueous sodium hydroxide in the presence of benzene. The preparation of 1-methylpyridinium salts is best accomplished by treating the extremely hygroscopic additive compound of methyl sulphate and pyridine with the acid corresponding with the salt required; the picrate, $C_{12}H_{10}O_7N_4$, is thus obtained anhydrous in needles, m. p. 113–114°, or rhombohedra, m. p. 109–110°.

1-Propylpyridinium bromide (pyridine propylbromide), prepared from pyridine and propyl bromide, yields a cadmbromide, $C_{16}H_{12}N_2Br_4$, crystallising in white needles, m. p. 117–118°; the chloride, mercuric chloride, m. p. 82°, and platinumchloride, orange-red crystals, m. p. 196°, are also described.

1-Propyl-2-pyridone, $C_8H_{11}ON$, is a light yellow liquid, b. p. 263–264°/730 mm., having a repulsive odour of fungi.

1-isoButylpyridinium iodide forms very hygroscopic, light yellow crystals; the picrate, leaflets, m. p. 114°; the platinumchloride, yellow leaflets, m. p. 220° (decomp.). 1-isoButyl-2-pyridone, $C_9H_{13}ON$, is a yellow oil, h. p. 264–265°/725 mm.

1-isoAmylpyridinium iodide forms hygroscopic crystals; the picrate, yellow needles, m. p. 145°, and the platinumchloride, yellow leaflets, which decompose at 200°, were also prepared. 1-isoAmyl-2-pyridone has b. p. 283–284°/730 mm.

3-Bromopyridine methiodide crystallises in hygroscopic, yellow needles, m. p. 146°, and is oxidised by potassium ferricyanide to 3-bromo-1-methyl-2-pyridone, which forms a brown oil, and on treatment with bromine in glacial acetic acid solution yields 3:5-dibromo-1-methyl-2-pyridone; the latter compound, which crystallises in white needles, m. p. 176°, has also been prepared (1) by the oxidation of the additive compound of methyl sulphate and 3:5-dibromopyridine. (2) by brominating 1-methylpyridone. 3:5-Dibromopyridine methiodide, obtained by the action of potassium iodide on the above-mentioned additive compound, resembles isoquinoline methiodide in its behaviour towards alkalis.

[With S. PFEIFER, N. PROHATZKA, and A. ALBERTINI].—The entrance of substituents into quaternary quinoline salts considerably modifies the behaviour of the latter towards alkalis; whilst 6-aminoquinoline methiodide on treatment with aqueous sodium hydroxide undergoes no change, the dinitro- and bromonitro-derivatives are converted into the corresponding carbinol bases by dilute sodium hydrogen carbonate. It thus appears that positive substituents prevent the transformation of ammonium bases into carbinol bases, whilst

with negative substituents the transformation takes place with extraordinary ease.

6-Diacetylaminquinoline, prepared by heating 6-aminoquinoline with acetic anhydride in benzene solution, crystallises in long, slender, white needles, m. p. 75° ; the product, obtained by the interaction of the methiodide and silver chloride, yields either 6-diacetylaminquinoline methochloride or 6-acetylaminquinoline methochloride, accordingly as it is crystallised from alcohol or water.

6-Acetylmino-1-methylquinolone, prepared by oxidising 6-acetylaminquinoline methiodide, crystallises in needles, m. p. 278° (compare Decker and Engler, Abstr., 1903, i, 518).

6-Aminoquinoline methochloride, obtained by heating the acetyl (or diacetyl) derivative with hydrochloric acid, crystallises in citron-yellow needles, m. p. $242-243^{\circ}$; it separates from water in efflorescent crystals containing one molecule of the solvent; the methiodide forms reddish-brown needles, m. p. 199° (compare Claus and Schnell, Abstr., 1896, i, 319). When treated with 35% aqueous sodium hydroxide, 6-aminoquinoline methiodide yields a substance,

crystallising in microscopic, red needles, m. p. 166° , which have a vivid green, metallic lustre, and yield solutions having a yellow fluorescence.

6:8-Dinitro-2-isobutyloxy-1-methyldihydroquinoline,

has m. p. 87° ; the methyl and ethyl ethers (Kaufmann and Strubin, this vol., i, 322) are also described.

6-Bromo-8-nitroquinoline, which has m. p. $170-177^{\circ}$ (compare Claus and Hartmann, Abstr., 1896, i, 391), on successive treatment with methyl sulphate and potassium iodide yields the methiodide, $\text{C}_{10}\text{H}_9\text{O}_2\text{N}_2\text{BrI}$, which crystallises in dark reddish-brown needles, decomposing at $185-186^{\circ}$. With dilute aqueous ammonia the methiodide yields **6-bromo-8-nitro-2-hydroxy-1-methyldihydroquinoline**, which has m. p. $173-175^{\circ}$, and forms a methyl ether, m. p. $121-122^{\circ}$; the ethyl ether crystallises in prisms, m. p. 111° .

3-Bromo-8-nitro-2-hydroxy-1-methyldihydroquinoline (Decker, Abstr., 1905, i, 374) is obtained in quantitative yield by the action of very dilute aqueous ammonia on the methiodide; the ethyl ether, large, light brown, prismatic crystals, has m. p. $90-91^{\circ}$. F. B.

Preparation of Halogen-substituted Indophenol Derivatives from Carbazoles and *p*-Nitrosophenols. LEOPOLD CASSELLA & Co. (D.R.P. 235836).—When *p*-nitrosophenol or its halogen derivatives are condensed in concentrated sulphuric acid solution with *N*-alkyl or halogenated carbazoles, indophenol derivatives of tinctorial value are produced.

The products from monochlorocarbazole and *p*-nitrosophenol, from carbazole and *N*-ethylcarbazole with *o*-chloronitrosophenol respectively, and from carbazole with 2:6-dibromonitrosophenol were prepared. They are dark blue or green substances, insoluble in water, but soluble in concentrated sulphuric acid with a blue

coloration, decompose above 250° without fusion, and yield colourless leuco-compounds.

F. M. G. M.

[Preparation of Anthraquinone Derivatives.] **FARBENFABRIK VORM. FRIEDR. BAYER & Co. (D.R.P. 236407).**—When a chloroanthraquinone is boiled with isatin (in benzene solution) in the presence of cuprous chloride and copper acetate and the mixture subsequently acidified, it yields the compound (annexed formula) as a bluish-red, crystalline powder. The products from 1:5-dichloroanthraquinone and isatin (1 mol.), a violet powder, and the same with 2 mols. of isatin were also prepared, whilst 4-bromo-1-methylaminoanthraquinone under similar conditions yielded a greenish black powder.

F. M. G. M.

Preparation of Phenanthridone Derivatives. BASSEN ANILIN- & SODA-FABRIK (D.R.P. 236857).—When halogen *o*-benzoyl aminoanthraquinones (or their derivatives) are boiled with or without copper powder in naphthalene solution with anhydrous sodium carbonate (or acetate), condensation occurs, yielding phenanthridone derivatives.

The compound (I), $C_{21}H_{11}O_2N$, prepared from 2-bromo-1-benzoyl aminoanthraquinone (without the addition of copper powder), crystallises from dichlorobenzene, and has m. p. $266-267^{\circ}$.

The compound (II), m. p. $274-275^{\circ}$, was obtained from 1-chloro-2-benzoylaminoanthraquinone in nitrobenzene solution without copper powder. The products from 2:3-dichloro-1:4-dibenzoylaminoanthra

(I.)

(II.)

(III.)

(IV.)

quinone and from 3-halogen-2-benzoylaminoanthraquinone do not fuse below 325°.

The product (III), $C_{28}H_{11}O_4N_2$, prepared from 1:5-dichloro-3:6-dibenzoylaminoanthraquinone in the presence of copper, does not melt at 320°.

The compound (IV), $C_{21}H_{10}O_2NCl$, m. p. 278—280°, was obtained from 1-chloro-6-chlorobenzoylaminoanthraquinone (prepared from 6-chlorobenzoyl chloride and 1-chloro-2-aminoanthraquinone).

F. M. G. M.

[Preparation of Carbamide Derivatives.] CARL JÄGER (D.R.P. 236594).—When an aromatic *m*-diamino-sulphonic acid (1 mol.) reacts with an aminonaphtholsulphonic acid (2 mols.) and carbonyl chloride (2 mols.) in dilute aqueous sodium carbonate solution, derivatives of carbamide are obtained. The substance,

$SO_3H \cdot C_6H_2Me[NH \cdot CO \cdot NH \cdot C_{10}H_7(OH) \cdot SO_3H]_2$, is prepared in this manner from 2:6-tolylenediamine-4-sulphonic acid, 6-amino- α -naphthol-3-sulphonic acid, and carbonyl chloride. These compounds when combined with 2 mols. of a diazonium compound yield orange to bluish-red direct cotton dyes. F. M. G. M.

Catalytic Decomposition of Alkylidenhydrazines. II. NICOLAI M. KJERNER (*J. Russ. Phys. Chem. Soc.*, 1911, 43, 951—962).—With a view to generalising the method of obtaining hydrocarbons previously described (this vol., i, 679), the author has studied the decomposition, in presence of potassium hydroxide, of the hydrazones of dihydrocarvone, carvenone, citronellaldehyde, and citral.

Under these conditions, dihydrocarvonehydrazone yields Δ^{100} -*p*-menthene (compare Perkin and Pickles, *Trans.*, 1905, 87, 639). The action of hydrobromic acid on this hydrocarbon gives the bromo-derivative, $C_{10}H_{16}Br$, which yields *i*- Δ^{100} -menthane (compare Wallach, *Abstr.*, 1906, i, 682) when distilled with aniline.

Carvenonehydrazone, when distilled in presence of fused potassium hydroxide, yields Δ^2 -menthene.

Citronellaldehydehydrazone yields the hydrocarbon,

b. p. 164.5°/756 mm., D_4^{20} 0.7533, n_D^{20} 1.4304, $[\alpha]_D^{20} + 9.28^\circ$. Oxidation of this hydrocarbon with permanganate yields acetone, active amylic acid (compare Welt, *Abstr.*, 1895, i, 203), and, as an intermediate product, the *keto-alcohol*,

b. p. 218°/755 mm., D_4^{20} 0.9069, n_D^{20} 1.4363, which reduces ammoniacal silver solution in presence of alkali, and forms a *semicarbazone*, m. p. 125—126°, $[\alpha]_D^{20} + 1.78^\circ$ to $+2.20^\circ$.

The hydrocarbon, b. p. 164.5°, obtained from citronellaldehydehydrazone, gives with hydrobromic acid the *bromo*-derivative,

D_4^{20} 1.0772, n_D^{20} 1.4578, which gives a hydrocarbon, $C_{10}H_{20}$, with almost the same physical constants as the original one when distilled with aniline, with the exception of its specific rotation, which is $[\alpha]_D^{20} + 4.39^\circ$.

Reduction of the hydrocarbon, b. p. 164.5°, by means of hydriodic acid in a sealed tube yields β -dimethyloctane,

b. p. 159—159.5°/742 mm., D_4^{20} 0.7313, n_D^{20} 1.4110, $[\alpha]_D^{20} + 1.75^\circ$ (compare Markownikoff and Reformatsky, *Abstr.*, 1893, i, 663; Skita and Ritter, *Ber.*, 1911, 44, 668; this vol., i, 272).

Citralhydrazona, when distilled with solid potassium hydroxide yields an inactive hydrocarbon, $\text{CMe}_2\text{CH}(\text{CH}_2\text{CH}_2\text{CMe}_2\text{CHMe})\text{CHMe}$, b. p. 164—165°/755 mm., D_4^{20} 0.7674, n_D^{20} 1.4443, which is isomene with the dihydromyrcene, b. p. 171.5—173.5°, obtained by Semmler (*Abstr.*, 1901, i, 732) by the reduction of myrcene. T. H. P.

Decomposition of Alkylidenehydrazines. Conversion of Pulegone [Tanacetone] into a Bicyclic Hydrocarbon, $\text{C}_{10}\text{H}_{18}$, NICOLAI M. KIJNER and A. ZAVADOVSKY (*J. Russ. Phys. Chem. Soc.*, 1911, 43, 1132—1148. Compare this vol., i, 679).—The action of hydrazine hydrate on tanacetone would be expected to give an alkylidenehydrazine of the structure

this yielding, on decomposition, $\Delta^{8,9}$ -menthene (compare Wallach, *Abstr.*, 1908, i, 402). It is found, however, that pulegohydrazine is not hydrolysed by mineral acids, with which it forms stable salt, and that, on decomposition, it gives a bicyclic hydrocarbon, carane,

hydrazine hydrate on pulegone is hence accompanied by isomerisation, pulegohydrazine having the annexed constitution.

Pulegohydrazine, $\text{C}_{10}\text{H}_{18}\text{N}_2$, is an almost colourless liquid, b. p. 131—132°/23 mm., 143—144°/35 mm., D_4^{20} 0.9602, $[\alpha]_D^{20} - 5.55^\circ$, n_D^{20} 1.4943. The thiosemicarbazone,

forms thin, rhombic plates, m. p. 176°; $[\alpha]_D^{20} - 114.33^\circ$. The hydrazine undergoes oxidation in the air, yielding pulegone, and an oily product which was not investigated.

Carane, $\text{C}_{10}\text{H}_{18}$, obtained by the slow distillation of pulegohydrazine with potassium hydroxide, has b. p. 169.5°/759 mm., D_4^{20} 0.8404—0.8411, n_D^{20} 1.4561—1.4576, exaltation of molecular refraction 0.72—0.83, $[\alpha]_D^{20} + 56.89^\circ$ to 57.64°. Carane is quite saturated in character, and, owing to the presence of the trimethylene ring (indicated by the optical exaltation) readily combines with 1 mol. of bromine or halogen

hydroacid. The bromo-derivative, $\text{CH}_2 \begin{array}{c} \text{CHMe} \cdot \text{CH}_2 \\ \text{CH}_2 \end{array} \text{CH} \cdot \text{CMe}_2\text{Br}$,

obtained by the action of hydrobromic acid, has b. p. 123—124°/29 mm. (slightly decomp.), D_4^{20} 1.1811, D_4^{25} 1.1691, n_D^{20} 1.4893—1.4914, $[\alpha]_D^{20} + 5.37^\circ$ to 5.42°, and loses hydrogen bromide in two different ways.

(1) with alcoholic potassium hydroxide it gives $\Delta^{8,9}$ -menthene (compare Wallach, *loc. cit.*), which yields β -methyladipic acid when oxidised with excess of permanganate; (2) with aniline the principal

product is Δ^{400} -*m*-menthene, $\text{CH}_3 \begin{array}{c} \text{CHMe} \cdot \text{CH}_2 \\ \text{CH}_2 \cdot \text{CH}_2 \end{array} \text{CH} \cdot \text{CMe} \cdot \text{CH}_3$, which is, however, mixed with Δ^{300} -*m*-menthene.

When Δ^{300} -*m*-menthene is treated with hydriodic acid and the iodide heated with aqueous-alcoholic potassium hydroxide, Δ^{300} -*m*-menthene is obtained.

Reduction of carane or Δ^{300} -*m*-menthene yields *m*-menthane.

Combination of carane with bromine (1 mol.) and distillation of the bromide thus obtained with quinoline gives levorotatory menthadiene, which, after prolonged boiling with sodium, becomes inactive, and has b. p. 182—185°/749 mm., D_4^{20} 0.8544, n_D^{20} 1.4916; this hydrocarbon in acetic anhydride solution gives an intense blue coloration with sulphuric acid. Such a coloration is given by Δ^{200} -*m*-menthadiene (compare Haworth, Perkin, and Wallach, *Trans.*, 1911, 99, 118), but this could only be derived from carane as a result of isomerisation of the bromide previous to the removal of hydrogen bromide (see also Perkin, *Trans.*, 1910, 97, 2154).

T. H. P.

Influence of Auxochromes on Phototropy. MAURICK PADOA and L. SANTI (*Atti R. Accad. Lincei*, 1911, [v], 20, ii, 196—200. (Compare this vol., i, 693).—On comparing the phototropic substances previously obtained, it appears that the aldehydrazones which contain auxochrome groups are generally more phototropic than those which do not contain any, and this is even more noticeable in the case of the osazones of diketones. The position of the auxochrome appears to have some influence. In the present paper eight anishydrazones (*p*-methoxyphenylhydrazones) are described, which have been prepared for comparison with the corresponding phenylhydrazones.

p-Methoxyphenylhydrazine (compare Altschul, *Abstr.*, 1892, 1080) is best obtained by diazotising *p*-anisidine and reducing the diazonium compounds with stannous chloride. It has m. p. 66° (Altschul, 65°).

Benzaldehyde-p-methoxyphenylhydrazone, $\text{OMe} \cdot \text{C}_6\text{H}_4 \cdot \text{NH} \cdot \text{N} \cdot \text{CHPh}$, crystallises in pale yellow needles, m. p. 123°, and is phototropic.

Anisaldehyde-p-methoxyphenylhydrazone,

forms lustrous, yellow scales, m. p. 126°, and is not phototropic.

Cinnamaldehyde-p-methoxyphenylhydrazone,

crystallises in rosettes of short, thick needles, m. p. 126.5°, and is phototropic.

Cuminaldehyde-p-methoxyphenylhydrazone,

forms long, pale yellow needles, m. p. 99°. It is phototropic.

Piperonaldehyde-p-methoxyphenylhydrazone,

crystallises in yellowish-green, lustrous needles, m. p. 134—135°, and is phototropic.

p-Tolualdehyde-p-methoxyphenylhydrazone,

forms lustrous, yellow scales, m. p. 131°, and is not phototropic.

Vanillin-p-methoxyphenylhydrazones,

crystallises in minute, pale yellow prisms, m. p. 125—126°, and is phototropic.

Salicylaldehyde-p-methoxyphenylhydrazones,

forms yellowish-green needles, m. p. 137°, and is not phototropic.

R. V. S.

Phototropy of the Hydrazones of Furfuraldehyde. I. SAMI (*Atti R. Accad. Lincei*, 1911, [v], 20, ii, 228—230. Compare Padoa and Graziani, *Abstr.*, 1910, i, 509, 778).—Furfuraldehyde-phenylhydrazone is not phototropic.

Furfuraldehyde-a-naphthylhydrazone, $\text{C}_6\text{H}_5\text{O} \cdot \text{CH} : \text{N} \cdot \text{NH} \cdot \text{C}_{10}\text{H}_7$, forms small, canary-yellow prisms, m. p. 110.5°, and is not phototropic.

Furfuraldehyde-β-naphthylhydrazone crystallises in pale yellow needles, m. p. 137°, and is phototropic.

Furfuraldehyde-p-tolylhydrazone, $\text{C}_6\text{H}_5\text{O} \cdot \text{CH} : \text{N} \cdot \text{NH} \cdot \text{C}_6\text{H}_4\text{Me}$, is a pale yellow, crystalline powder, which is weakly phototropic.

R. V. S.

Action of Aldehydes on Pyrrole Derivatives. U. COTARINI (*Atti R. Accad. Lincei*, 1911, [v], 20, ii, 312—317).—Pyrrole derivatives which have only one free methine hydrogen, and have a negative substituent, react with aliphatic aldehydes when warmed with them in the presence of a little zinc chloride. The condensations with form aldehyde are best effected in the presence of hydrochloric acid.

Bis-5-acetyl-2:4-dimethylpyrrylmethane, $\text{CH}_2(\text{C}_4\text{NHMe}_2\text{Ac})_2$, forms yellow scales or needles, m. p. 272°.

Bis-3-acetyl-2:4-dimethylpyrrylmethane, $\text{CH}_2(\text{C}_4\text{NHMe}_2\text{Ac})_2$, is a yellow, crystalline powder, m. p. 268°.

Bis-5-benzoyl-2:4-dimethylpyrrylmethane, $\text{CH}_2(\text{C}_4\text{NHMe}_2\text{Bz})_2$, crystallises in small, colourless needles, m. p. 257—258°.

aa-Bis-5-acetyl-2:4-dimethylpyrrylethane, $\text{CHMe}(\text{C}_4\text{NHMe}_2\text{Ac})_2$, forms yellow needles, m. p. 253°.

aa-Bis-3-acetyl-2:4-dimethylpyrrylethane, $\text{CHMe}(\text{C}_4\text{NHMe}_2\text{Ac})_2$, crystallises in pale, rose-coloured scales, m. p. 254°.

aa-Bis-5-benzoyl-2:4-dimethylpyrrylethane, $\text{CHMe}(\text{C}_4\text{NHMe}_2\text{Bz})_2$, forms very small prisms, m. p. 244—245°.

aa-Bis-5-benzoyl-2:4-dimethylpyrrylbutane, $\text{CHPr}(\text{C}_4\text{NHMe}_2\text{Bz})_2$, crystallises in small, yellow prisms, m. p. 217—218°.

aa-Bis-5-benzoyl-2:4-dimethylpyrrylisobutane,

is a yellow, flocculent substance, which on heating becomes soft at 80°, spongy at 100°, and melts at 180°.

aa-Bis-5-benzoyl-2:4-dimethylpyrrylheptane,

forms a yellow, crystalline powder, m. p. 178—179°.

R. V. S.

Preparation of Halogenated Derivatives of Indigotin. BADISCHE ANILIN- & SODA-FABRIK (D.R.-P. 235631. Compare this vol., i, 925).—The preparation of tetrahalogenated indigotins has

previously been recorded; penta- and hexa-halogenated derivatives have now been prepared.

Dichlorotetrabromoindigotin is obtained when 4:4'-dichloroindigotin, dissolved in nitrobenzene (or acetic acid), is slowly treated with bromine and the mixture subsequently boiled until the evolution of hydrogen bromide ceases.

Pentachloroindigotin is prepared by the further chlorination of 4:4'-dichloroindigotin at 25–30° in acetic acid solution. The leuco-derivatives and intermediate halogenated acetylindigotins are also mentioned and their tinctorial properties described. F. M. G. M.

Hydantoins. VI. Action of Acylthiocarbamates, Acylthiocarbamates, Acyldithiocarbamates, and Acylimidodithiocarbonates on α -Amino-acids. 2-Thiohydantoin. HENRY L. WHEELER, BEN H. NICOLET, and TREAT B. JOHNSON (*Amer. Chem. J.*, 1911, 43, 456–474).—This work was undertaken for the purpose of synthesising some *N*-acyl derivatives of hydantoic and thiohydantoic acids and of investigating their behaviour on hydrolysis and their reactivity towards aldehydes.

Benzoyl- ψ -ethylhydantoic acid, $\text{NBz}\cdot\text{C}(\text{OEt})\cdot\text{NH}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$, m. p. 161°, obtained by the action of aminoacetic acid on ethyl benzoylthiocarbamate in presence of potassium hydroxide, crystallises in needles; its *ethyl* ester has m. p. 79–80°. *Ethyl benzoyl- ψ -methylhydantoate*, $\text{NBz}\cdot\text{C}(\text{OMe})\cdot\text{NH}\cdot\text{CH}_2\cdot\text{CO}_2\text{Et}$, m. p. 103°, is obtained by the interaction of ethyl aminoacetate and methyl benzoylthiocarbamate. When benzoyl- ψ -ethylhydantoic acid or ethyl benzoyl- ψ -methylhydantoate is hydrolysed with hydrochloric acid, *benzoylhydantoic acid*, $\text{NHBz}\cdot\text{CO}\cdot\text{NH}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$, m. p. 253–254° (decomp.), is produced, which crystallises in plates, and is decomposed by hydrochloric acid into benzoic acid and hydantoin. An attempt to condense benzoylhydantoic acid with benzaldehyde was not successful.

Thiobenzoylhydantoic acid, $\text{NHBz}\cdot\text{CS}\cdot\text{NH}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$, m. p. 202°, prepared by heating a mixture of aminoacetic acid, potassium hydroxide, and ethyl benzoyldithiocarbamate, crystallises in plates or needles; its *ethyl* ester has m. p. 128–129°. When either thiobenzoylhydantoic acid or thioacetylhydantoic acid is heated with concentrated hydrochloric acid, 2-thiohydantoin, $\text{CH}_2\cdot\begin{matrix} \text{CO}\cdot\text{NH} \\ \text{NH}\cdot\text{CS} \end{matrix}$, m. p. 221°, is produced, which forms yellow prisms. Benzoylthiohydantoic acid condenses with benzaldehyde to form 2-thio-1-benzoyl-4-benzylidenehydantoin, $\text{CHPh}\cdot\text{C}\cdot\begin{matrix} \text{CO}\cdot\text{NBz} \\ \text{NH}\cdot\text{CS} \end{matrix}$, m. p. 181°, which crystallises in

rectangular plates, and is decomposed by potassium hydroxide solution with production of 2-thio-4-benzylidenohydantoin, m. p. 258°, which can also be obtained by the condensation of thiohydantoin with benzaldehyde. Rubemann and Stapleton (*Trans.*, 1900, 77, 246) have stated that this compound has m. p. 280° (decomp.) when heated slowly and m. p. 300° (decomp.) when heated rapidly, but the authors found the m. p. 258° under all conditions.

Thiobenzoyl- ψ -ethylhydantoic acid, $\text{NBz}\cdot\text{C}(\text{SEt})\cdot\text{NH}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$, m. p.

198°, prepared from aminoacetic acid and ethyl benzoyliminodithiocarbonate, forms clusters of needles; its *ethyl ester* has m. p. 77–78°.

Thioacetylhydantoic acid, $\text{NHAc} \cdot \text{CS} \cdot \text{NH} \cdot \text{CH}_2 \cdot \text{CO}_2\text{H}$, m. p. 266° (decomp.), from aminoacetic acid and ethyl acetyldithiocarbamate, crystallises in slender needles; its *potassium salt* has m. p. 235–237° (decomp.), and its *ethyl ester*, m. p. 104–105°. The acid condenses with benzaldehyde to form 2-thio-4-acetyl-4-benzylidenethyldantoin, $\text{CHPh} \cdot \text{C} \begin{smallmatrix} \text{CO} \cdot \text{N} \cdot \text{Ac} \\ \text{NH} \cdot \text{CS} \end{smallmatrix}$, m. p. 231°, which crystallises in light yellow prisms.

Thio-1-acetyl-4-methylhydantoic acid, $\text{NHAc} \cdot \text{CS} \cdot \text{NH} \cdot \text{CHMe} \cdot \text{CO}_2\text{H}$, m. p. 171°, from alanine and ethyl acetyldithiocarbamate, crystallises in prisms, and is converted by concentrated hydrochloric acid into

2-thio-4-methylhydanoin, $\text{CHMe} \cdot \text{C} \begin{smallmatrix} \text{CO} \cdot \text{NH} \\ \text{NH} \cdot \text{CS} \end{smallmatrix}$, m. p. 158–159°, which forms flat prisms.

E. G.

Preparation of 5:5-Dialkylthiobarbituric Acids. FRANZ MERCK (D.R.-P. 235801. Compare this vol., i, 683).—The preparation of 5:5-dialkylthiobarbituric acids by the employment of metallic alkyl oxides has previously been described; it is found that these can be replaced by the free alkali metal (or its amide), and the preparation of diethylthiobarbituric acid (m. p. 180°) from diethylmalonic ester, thiocarbamide, and sodamide (or metallic sodium) is now demonstrated.

F. M. G. M.

Constitution of the Nitro-2:5-dimethylbenzimidazole Obtained by Nitration. DAVID MARON and D. SALZBERG (*Ber.*, 1911, 44, 2999–3005).—The proof that the nitro-group in the nitro-compound, m. p. 200–201°, obtained by the nitration of 2:5-dimethylbenzimidazole (Niementowsky, *Abstr.*, 1886, 719), occupies position 6 is as follows. By reduction with iron and 50% acetic acid, the nitro-compound yields an *amine*, m. p. 85°, the *acetyl* derivative of which has m. p. 263–264°. By nitration, diacetyl-3:4-tolylenediamine yields a nitro-compound, which can be reduced to an *amine*, m. p. 252–253°, which forms an azoimide with nitrous acid (therefore the amino-group is ortho to an NHAc group), and yields the preceding acetylaminodimethylbenzimidazole, m. p. 263–264°, by heating at 250°. Finally, the nitration of diacetyl-3:4-tolylenediamine yields a nitro-compound, the reduction of which yields an *amine*, m. p. 238°, the *acetyl* derivative of which, m. p. 273–274°, is identical with that obtained by the acetylation of the preceding amine, m. p. 252–253°. Consequently, this acetylated triamino-derivative must be triacetyl-3:4:6-triaminotoluene, the amine m. p. 238° is 6-aminodiacetyl-3:4-tolylenediamine, the amine m. p. 252–253° is 3-aminodiacetyl-4:6-tolylenediamine, and the nitrated dimethylbenzimidazole is 6-nitro-2:5-dimethylbenzimidazole.

C. S.

Researches on Azinetriphenylpyrrole. FRANCESCO ANGELICO (*Gazzetta*, 1911, 41, ii, 378–381).—By the action of ammonium sulphide on the diketone, $\text{CH} \cdot \text{CH} \cdot \text{C} \begin{smallmatrix} \text{N} \cdot \text{N} \\ \text{C} \cdot \text{CBz} \cdot \text{CBz} \end{smallmatrix}$ (compare *Abstr.*, 1909,

i. 127), the author obtained (Abstr., 1910, i, 444) the corresponding *dithioketone*, m. p. 206°, and he has now isolated from the product of the same reaction, a thiophen compound, $C_{12}H_{14}N_2S$, which forms large yellow needles, m. p. 151°. When treated with nitric acid this substance regenerates the ketone of m. p. 163°.

The structure of the dithioketone follows from the fact that both it and the diketone yield, when treated with hydroxylamine, the same products, namely: (1) a red pyrrole derivative; (2) a substance, probably a mixture of mono- and di-oximes; (3) a substance, $C_{14}H_{22}O_2N_2$, which crystallises in golden-yellow needles, m. p. 205—206°.

R. V. S.

5-Aminophenazoxonium Salts. FRIEDRICH KEHRMANN and L. LOWAT (*Ber.*, 1911, 44, 3006—3011).—5-Aminophenazoxonium and 5-aminophenasthionium salts cannot be prepared in a similar manner to 5-aminophenylphenazonium salts (Kehrmann and Massenkoff, this vol., i, 927). However, by the reduction of Ullmann and Kuhn's 5-nitrophenoxazine (Abstr., 1909, i, 473) by stannous chloride and concentrated hydrochloric acid, 5-aminophenoxazine hydrochloride, $C_6H_4 \begin{smallmatrix} \text{NH} \\ \diagup \quad \diagdown \\ \text{O} \end{smallmatrix} C_6H_3 \cdot NH_2 \cdot HCl$, is obtained, which is oxidised by cold concentrated ferric chloride to 5-aminophenazoxonium chloride, $C_6H_4 \begin{smallmatrix} \text{N} \\ \diagup \quad \diagdown \\ \text{OCl} \end{smallmatrix} C_6H_3 \cdot NH_2$, greenish-black crystals; the corresponding bromide, iodide, nitrate, and platinichloride are described.

When acetylated by sodium acetate, acetic anhydride, and a trace of zinc dust, 5-aminophenoxazine hydrochloride yields 5-acetylaminophenazoxazine, m. p. 197° (decomp.), colourless needles, which is oxidised by ferric chloride to a mixture of two substances, m. p. about 215° (decomp.), which are probably isomeric 5-acetylaminophenazoxones.

3:5-Diaminophenazoxonium chloride reacts with acetic anhydride and zinc chloride to form a blackish-red, crystalline zincichloride, from which 3-amino-5-acetylaminophenazoxonium chloride,

is obtained in dark red prisms with a green lustre. The platinichloride is a brownish-red, crystalline powder, whilst the base itself, m. p. 185—190° (decomp.), crystallises in citron yellow needles.

C. S.

Mutual Replacement of Azines and Semicarbazones. GUSTAV KNÖPFER (*Monatsh.*, 1911, 32, 753—772).—It has been shown previously that the azine residue is readily replaced by phenylhydrazine, and this in turn by semicarbazide (Knöpfer, Abstr., 1909, i, 188; 1910, i, 432). It is now found that azines are very easily converted into semicarbazones, but that in most instances the reverse change does not take place. When aldehydes or ketones are treated with a molecular mixture of semicarbazide and hydrazine, the semicarbazone is, as a rule, the sole product.

The conversion into azine was observed in the case of the semicarbazones of salicylaldehyde, *p*-hydroxybenzaldehyde, *p*-nitrobenz

aldehyde, resorcyaldehyde, protocatechualdehyde, *p*-dimethylaminobenzaldehyde, and acetone.

The azine of phenyl ethyl ketone forms yellow needles, m. p. 79—80°. The semicarbazone forms colourless crystals, m. p. 179—180°.

Diethyl ketone-semicarbazone forms colourless, soluble needles, m. p. 187—190°; *α*-dichloroacetone-semicarbazone has m. p. 167°, yielding a compound, m. p. 254°, which proved to be methyl glyoxaldisemicarbazone.

Chloralhydrate, $\text{CCl}_3\cdot\text{CH}(\text{OH})\cdot\text{NH}\cdot\text{NH}_2$, forms large, colourless crystals, m. p. 85° (decomp.). The hydrate is readily replaced by semicarbazide, forming chloral semicarbazide, m. p. 90°, but the reverse change does not take place.

The only substances to give both semicarbazone and azine on treatment with an equimolecular mixture of the two bases are *p*-nitrobenzaldehyde and *p*-dimethylaminobenzaldehyde. E. F. A.

3 : 5 - Diaminophenazthionium Derivatives. FRIEDMAN, KEHRMANN and J. STEINBERG (*Ber.*, 1911, 44, 3011—3017).—The course of the reaction between picryl chloride and *o*-aminophenyl mercaptan proceeds, as stated by Kehrman and Schild (*Abstr.*, 1909, i, 61), not as by Mitsugi, Beyschlag, and Mühlau (*Abstr.*, 1910, i, 337, the proof being as follows. A hot alcoholic solution of picryl chloride (2 mols.) condenses normally with *oo*-diaminodiphenyl disulphide hydrochloride in the presence of sodium acetate, yielding *oo*-dipicryl diaminodiphenyl disulphide, $[\text{C}_6\text{H}_3(\text{NO}_2)_3\cdot\text{NH}\cdot\text{C}_6\text{H}_4]_2\text{S}_2$, which is reduced by alcoholic sodium sulphide to *o*-picrylamino phenyl mercaptan, $\text{C}_6\text{H}_3(\text{NO}_2)_3\cdot\text{NH}\cdot\text{C}_6\text{H}_4\cdot\text{SH}$. The latter, in which the picryl group must be attached to the nitrogen atom, is converted by warm aqueous sodium hydroxide into the same dinitrophenazine as results from the condensation of *o*-aminophenyl mercaptan and picryl chloride; consequently in this condensation the amino, not the sulphydryl, group reacts with the chlorine atom of the picryl chloride.

3 : 5-Diaminophenazthionium chloride, acetic anhydride, and zinc chloride react to form a violet-black, crystalline zincchloride, from which 3-amino-5-acetylaminophenazthionium chloride,

can be obtained in violet needles; the corresponding nitrate, platinumchloride, and dichromate are described, whilst the base itself, $\text{C}_{11}\text{H}_{11}(\text{ON}_2)_2$, crystallises in brick-red needles.

In the hope of eliminating an amino-group, 3 : 5-diaminophenazthionium chloride, dissolved in moderately-concentrated sulphuric acid, has been treated with 10% sodium nitrite at 0°; however, the product, isolated as the nitrate, brownish-yellow needles, appears to be a diazonium salt of the annexed constitution from its analysis, explosiveness, and general behaviour. When treated with boiling water containing a little sulphuric acid, nitrogen is evolved, and a brownish-red substance, $\text{C}_{12}\text{H}_7\text{ON}_3\text{S}$, is obtained. C. S.

Preparation of 5:5-Dialkyliminobarbituric Acids (2-Imino-4,6-diketo-5-dialkylpyrimidines). EMANUEL MERCK (D.R.P. 335803).—Dialkylmalonic esters react with guanidine in the presence of condensing agents to yield dialkylmalonylguanidines (5:5-dialkyliminobarbituric acids).

3-Imino-5:5-diethylbarbituric acid, $\text{CET}_2\text{C}(\text{CO}\cdot\text{NH})_2\text{C}\cdot\text{NH}$, colourless needles, which on heating decompose without fusion, forms a crystalline nitrate, and on boiling with mineral acids furnishes diethylbarbituric acid, m. p. 191° . F. M. G. M.

1-Phenyl-5-methyl-1:2:4-triazole and Cyanophenylacetamidine. GUIDO PELLIZZARI (*Gazzetta*, 1911, 41, ii, 93—100. Compare following abstract).—Bladin (Abstr., 1891, 472) described 1-phenyl-5-methyl-1:2:4-triazole (at first erroneously as 1-phenyl-3-methyl-1:2:4-triazole) as an uncrystallisable oil, b. p. about 250° , whilst Ramberger and Gruyter (Abstr., 1894, i, 23) recorded the same substance as a crystalline solid, m. p. 191° . The author has prepared 1-phenyl-5-methyl-1:2:4-triazole from formylphenylhydrazine and acetamide (compare following abstract), and finds that it is identical with the substance described by Bladin. The substance, m. p. 191° , of Ramberger and Gruyter is cyanophenylacetamidine,

identical with that obtained from ethylisoacetanilide and cyanamide by the method used by Comstock and Wheeler (Abstr., 1892, 747) for cyanophenylformamidine. Cyanophenylacetamidine has m. p. 193° . With warm potassium hydroxide it yields acetanilide and cyanamide. When treated with concentrated hydrochloric acid, it takes up water with formation of carbamidophenylacetamidine, $\text{NPh}\cdot\text{CMe}\cdot\text{NH}\cdot\text{CO}\cdot\text{NH}_2$, which crystallises in lustrous plates, m. p. 160° (decomp.) if rapidly heated, or about 166° if slowly heated.

R. V. S.

Triazole and its Derivatives. GUIDO PELLIZZARI (*Gazzetta*, 1911, 41, ii, 20—42. Compare Abstr., 1895, i, 308; Pellizzari and Massa, Abstr., 1897, i, 205; 1901, i, 488).—The author gives a summary of the triazole derivatives which have been prepared by himself and his collaborators, and describes a number of other compounds obtained in the same way. Some of those have been prepared already by other investigators by different methods.

2-Phenyl-1:3:4-triazole (compare Young, Trans., 1901, 79, 659) can be prepared from benzoylhydrazine and formamide, or from formylhydrazine and benzamide. The hydrochloride, $\text{C}_6\text{H}_5\text{N}_3\cdot\text{HCl}$, forms colourless needles, m. p. 195° . The *platinichloride*,

crystallises in orange-yellow plates, decomposing at 255° . Young obtained this salt with $3\text{H}_2\text{O}$. The platinic chloride compound, $(\text{C}_6\text{H}_5\text{N}_3)_2\text{PtCl}_6$, obtained by boiling the preceding salt with water, is a yellow, flocculent substance.

2:5-Dimethyl-1:3:4-triazole (compare Stollé, Abstr., 1904, i, 453) can be prepared from acetylhydrazine and acetamide.

2:5-Diphenyl-1:3:4-triazole (compare Finner, *Abstr.*, 1894, i, 336) can be obtained from benzoylhydrazine and benzanilide.

1-Phenyl-3-methyl-1:2:4-triazole (compare Andreocci, *Abstr.*, 1892, i, 636) is obtained, mixed with 1-phenyl-1:2:4-triazole and 1-phenyl-5-methyl-1:2:4-triazole, by the action of acetylphenylhydrazine on formamide. The 1-phenyl-1:2:4-triazole is separated with the aid of the insolubility of its nitrate, $C_6H_7N_3 \cdot HNO_3$, which forms white needles, m. p. 141° . 1-Phenyl-1:2:4-triazole picrate, $C_6H_7N_3 \cdot C_6H_5O_7N_3$, has m. p. 159° . 1-Phenyl-3-methyl-1:2:4-triazole picrate, $C_9H_9N_3 \cdot C_6H_5O_7N_3$, forms long, pale yellow needles, m. p. 171° .

1-Phenyl-5-methyl-1:2:4-triazole, b. p. 275° (compare preceding abstract), can be obtained from formylphenylhydrazine and acetamide. It is mixed with 1-phenyl-1:2:4-triazole and 1-phenyl-3-methyl-1:2:4-triazole, of which the former can be removed in the form of nitrate, and the latter by distillation. 1-Phenyl-5-methyl-1:2:4-triazole picrate, $C_9H_9N_3 \cdot C_6H_5O_7N_3$, forms short, prismatic crystals, m. p. 146° . The platinichloride, $(C_9H_9N_3)_2PtCl_6 \cdot 2H_2O$, crystallises in yellow plates, m. p. 129° (decomp.). The platinic chloride compound, $(C_9H_9N_3)_2PtCl_6$, is obtained as a pale yellow precipitate by boiling the preceding substance with water. 1-Phenyl-5-methyl-1:2:4-triazole yields the same methyltriazole as 1-phenyl-3-methyl-1:2:4-triazole (compare Andreocci, *loc. cit.*), so that there is only one 3-methyl-1:2:4-triazole.

1:3:5-Triphenyl-1:2:4-triazole (compare Engelhard, *Abstr.*, 1897, i, 127) can be obtained: (1) from benzamide and β -benzoylphenylhydrazine; (2) from benzamide and α -benzoylphenylhydrazine; (3) from dibenzoylphenylhydrazine and ammonia. Its hydrochloride crystallises in needles, m. p. 174° .

1-Phenyl-3:5-dimethyl-1:2:4-triazole, $C_{10}H_{11}N_3$, from acetamide and acetylphenylhydrazine, forms colourless crystals, m. p. 43° , b. p. 261° . The platinichloride, $(C_{10}H_{11}N_3)_2PtCl_6 \cdot 2H_2O$, forms orange-coloured, acicular crystals, m. p. $185-186^\circ$; the anhydrous salt has m. p. 165° . The picrate, $C_{10}H_{11}N_3 \cdot C_6H_5O_7N_3$, crystallises in long, yellow needles, m. p. 156° .

1-Phenyl-2-methyl-1:3:4-triazole, $C_9H_9N_3$, from acetylphenylhydrazine and formanilide, forms laminar crystals (containing $11H_2O$), m. p. 68° ; the anhydrous salt has m. p. 112° . The picrate, $C_9H_9N_3 \cdot C_6H_5O_7N_3$, has m. p. 134° . The platinichloride, $(C_9H_9N_3)_2PtCl_6$, crystallises in orange-coloured laminae, m. p. 206° ; when it is boiled with water the platinic chloride compound, $(C_9H_9N_3)_2PtCl_6$, is obtained as a pale yellow precipitate. R. V. S.

Action of Acetyl Chloride on Acetylbiuret. ADRIANO OSTROGOVICH (*Gazzetta*, 1911, 41, ii, 70-74).—Further examination of the base obtained by the action of acetyl chloride on acetylbiuret (compare *Abstr.*, 1898, i, 336) has shown that it is diketomethyltriazine (identical with that of Nencki, *Ber.*, 1876, 9, 234), formed by a dehydration analogous to that which occurs in the case of acetylguanylcabamide (compare *Abstr.*, 1909, i, 461):

This method is the most convenient for the synthesis of the substance, since it is only necessary to heat biuret with an excess of methyl chloride for two or three hours at 100°, and then to raise the temperature to 140—145° for about four hours. R. V. S.

5-Aminopyrazoles and Iminopyrines. II. AUGUST MICHAELIS (*Annalen*, 1911, 385, 1—43. Compare Abstr., 1905, i, 476).—The paper contains a description of the derivatives of 5-anilo- and 5-tolyl-iminopyrazolones (5-anilino- and 5-toluidino-pyrazoles). A general method of preparing these substances is the heating of the primary aromatic base and antipyrine chloride or the 2-methochlorides of other 5-chloropyrazoles at 200°.

5-Anilo-1-phenyl-3-methylpyrazolone (5-anilino-1-phenyl-3-methylpyrazole), $\text{NPh} \cdot \text{C} \begin{smallmatrix} \text{NPh} \cdot \text{N} \\ | \\ \text{CH}_2 \cdot \text{CMe} \end{smallmatrix}$ or $\text{NHPh} \cdot \text{C} \begin{smallmatrix} \text{NPh} \cdot \text{N} \\ | \\ \text{CH} \cdot \text{CMe} \end{smallmatrix}$, m. p. 120°, b. p. 365—366°, thus prepared from aniline and antipyrine chloride forms a hydrochloride, $\text{C}_{16}\text{H}_{15}\text{N}_3 \cdot \text{HCl}$, m. p. 118°, platinichloride, m. p. 135°, hydriodide, $\text{C}_{16}\text{H}_{15}\text{N}_3 \cdot \text{HI} \cdot \text{H}_2\text{O}$, m. p. 110°, nitrate, m. p. 150°, and hydrogen sulphate, m. p. 153°. [With FELIX RISSE.]—It is converted by concentrated hydrochloric acid and sodium nitrite in a freezing mixture into 4-oximino-5-anilo-1-phenyl-3-methylpyrazolone (4-nitroso-5-anilino-1-phenyl-3-methylpyrazole), m. p. 168°, deep green needles hydrochloride, $\text{C}_{16}\text{H}_{14}\text{ON}_4 \cdot \text{HCl}$, yellow needles). This nitroso-compound is unstable in solution, readily changing to the isomeric 3:4-diphenyl-6-methyldihydropyrazofurazan, $\text{N} \begin{smallmatrix} \text{NPh} \cdot \text{C} \cdot \text{NPh} \\ | \\ \text{CMe} \cdot \text{C} \cdot \text{NH} \end{smallmatrix} \text{O}$, m. p. 157°, yellow needles, which is also obtained by the action of concentrated hydrochloric acid and sodium nitrite (in small excess) on 5-anilino-1-phenyl-3-methylpyrazole at a moderate temperature.

4-Amino-5-anilino-1-phenyl-3-methylpyrazole, $\text{C}_{16}\text{H}_{16}\text{N}_4$, m. p. 140—141°, white needles, obtained by the reduction of the nitroso-compound, forms a hydrochloride, m. p. 240°, phenylcarbamide, m. p. 220°, phenylthiocarbamide, m. p. 160°, and acetyl derivative, m. p. 130° (decomp.), and is converted by sodium nitrite and warm dilute acetic acid into 3:4-diphenyl-6-methylaziminopyrazole,

white needles, m. p. 152°.

5-p-Nitroanilino-1-phenyl-3-methylpyrazolone,

yellow needles, m. p. 153°, can be obtained in bad yield by the action of concentrated nitric acid on the anilophenylmethylpyrazolone, but is best prepared by heating 2:5-p-nitroanilopyrine hydrochloride or hydriodide (following abstract); the m-nitro-isomeride, m. p. 138°, has been obtained by a method similar to the latter.

[With FELIX ISERT.]—**5-Anilo-1-p-bromophenyl-3-methylpyrazolone**, $\text{C}_{16}\text{H}_{14}\text{N}_3\text{Br}$, m. p. 106°, is obtained by distilling p-bromoanilopyrine (2:5-endoanilo-1-p-bromophenyl-2:3-dimethylpyrazole) hydro-

chloride (following abstract) under 11 mm. pressure, or by heating aniline and 5-chloro-1-*p*-bromophenyl-3-methylpyrazole-2-methylchloride at 200°; the corresponding *p*-chloro-compound has m. p. 94°.

[With W. THOMAS.]—5-*p*-Bromoanilo-1-phenyl-3-methylpyrazolone, m. p. 136°, and the corresponding chloro-compound, m. p. 139°, are obtained by methods similar to the preceding. The action of bromine (3 mols.) in acetic acid on 5-anilo-1-phenyl-3-methylpyrazolone produces a tribrominated substance, m. p. 131° (4-bromo-5-bromoanilo-1-phenyl-3-methylpyrazolone!), which certainly contains a bromine atom in position 4, since it is unattacked by nitrous acid.

[With FELIX RISSE.]—5-Anilo-1-phenyl-4-benzylidene-3-methylpyrazolone, m. p. 164°, yellow prisms, and the corresponding anisylidene derivative, m. p. 205°, yellow needles, are prepared by heating the anilo-phenylmethylpyrazolone and benzaldehyde or anisaldehyde with zinc chloride at 125° for four to five hours.

[With FELIX ABRAHAM.]—The reduction of 4-nitroso-5-methylanilino-1-phenyl-3-methylpyrazole (4-nitroso- ψ -anilopyrine) (Abstr., 1906, i. 61) yields 4-amino-5-methylanilino-1-phenyl-3-methylpyrazole,

m. p. 85°, which forms a hydrochloride, m. p. 197°, benzylidene derivative, m. p. 101° (by means of which the base is best purified), *salicylidene* derivative, m. p. 133°, *cinnamylidene* derivative, m. p. 114°, *benzoyl* derivative, m. p. 167°, and *carbamide*, $\text{C}_{17}\text{H}_{16}\text{N}_4 \cdot \text{NH} \cdot \text{CO} \cdot \text{NH}_2$, m. p. 193°. By diazotisation, 4-amino- ψ -anilopyrine yields a stable, crystalline diazo- ψ -anilopyrine chloride, which couples with β -naphthol to form a red, crystalline substance, $\text{C}_{17}\text{H}_{14}\text{N}_4 \cdot \text{N}_2 \cdot \text{C}_{10}\text{H}_6 \cdot \text{OH}$, m. p. 173°. 4-Amino-5-ethylanilino-1-phenyl-3-methylpyrazole (4-amino- ψ -ethylanilopyrine) obtained by the reduction of 4-nitroso- ψ -ethylanilopyrine (Abstr., 1908, i. 61), crystallises in white leaflets, has m. p. 129.5°, and forms a hydrochloride, $\text{C}_{18}\text{H}_{20}\text{N}_4 \cdot \text{HCl}$, m. p. 220°, and *benzoyl* derivative, m. p. 208°. 5-Anilino-1-phenyl-3-methylpyrazole cannot be acetylated (or alkylated) directly, but 5-acetylanilino-

1-phenyl-3-methylpyrazole, $\text{NPhAc} \cdot \text{C} \begin{array}{c} \nwarrow \text{NPh} \\ \parallel \text{N} \\ \searrow \text{CH} - \text{CMe} \end{array}$, m. p. 96°, can be prepared by distilling a solution of anilopyrine in chloroform with acetyl chloride, at first under ordinary, and finally under reduced, pressure.

5-*p*-Nitromethyl-anilino-1-phenyl-3-methylpyrazole,

m. p. 174°, and the *meta*-isomeride, m. p. 125°, form stout, yellow crystals, and are prepared by heating the methiodides of the corresponding 2:5-nitroanilopyrines. 5-*p*-Chloromethyl-anilino-1-phenyl-3-methylpyrazole and the corresponding *p*-bromo-compound have m. p. 61° and 84° respectively, whilst the isomeric 5-anilino-1-*p*-chlorophenyl-2:3-dimethylpyrazole and 5-anilino-1-*p*-bromophenyl-2:3-dimethylpyrazole have m. p. 126° and 120° respectively.

[With FRIEDRICH WALTER.]—5-Anilo-1-phenylpyrazolone,

m. p. 138°, is prepared by heating 5-chloro-1-phenylpyrazole-2-methyl-

iodide (following abstract) with aniline (2 mols.) at 200°, forms a green, crystalline 4-azimino-(or nitroso-) compound, m. p. 113°, and yields a *methiodide* (identical with 2:5-anilo-1-phenyl-2-methylpyrazole hydriodide [following abstract]) with methyl iodide at 110—130°, an *ethiodide*, m. p. 149°, and a *propiodide*, m. p. 165°. 5-Methylanilino-1-phenylpyrazole, m. p. 51°, prepared by heating 5-anilo-1-phenyl-3-methylpyrazole methiodide under 13 mm. pressure, forms a stable, dark green 4-nitroso-derivative, m. p. 99°.

[With F. KISSK.]—5-p-Tolylimino-1-phenyl-3-methylpyrazolone,

m. p. 109°, is prepared by heating 2:5-p-tolylimino-1-phenylpyrrole hydriodide (following abstract) under 15—20 mm. pressure, or, better, by heating antipyrine chloride and p-toluidine (2 mols.) at 200°. Its 4-azimino-derivative, m. p. 117°, dark green leaflets, forms a reddish-yellow hydrochloride, $\text{C}_{17}\text{H}_{16}\text{ON}_4\text{HCl}$, m. p. 152°, and yields by reduction 4-amino-5-p-toluidino-1-phenyl-3-methylpyrazole, m. p. 131° (hydrochloride, m. p. 241—242°; acetyl derivative, m. p. 193°; azoimido-compound, m. p. 111—112°). 4-Phenyl-3-p-tolyl-6-methyldihydropyrazo-

lurazan, $\text{N} \begin{array}{l} \text{NPh} \cdot \text{C} \cdot \text{N}(\text{C}_7\text{H}_7) \\ \text{CMe} \cdot \text{C} \cdot \text{NH} \end{array} \text{O}$, obtained by intramolecular change

from the preceding oximino-compound, forms yellow needles, m. p. 176°. 5-p-Tolylimino-1-phenyl-3-methylpyrazolone condenses with benzaldehyde and with anisaldehyde in the presence of zinc chloride to form the *benzylidene* and *anisylidene* derivatives, m. p. 163° and 184° respectively.

5-Anilo-1-p-tolyl-3-methylpyrazolone, m. p. 106°, and the corresponding o-tolyl compound, m. p. 131°, are obtained by heating the hydriodides of the respective tolylanilopyrines (following abstract). 5-Methylanilino-1-p-tolyl-3-methylpyrazole, m. p. 96°, forms a hydrochloride, m. p. 133.5°, and platinumchloride, m. p. 189°. 5-Methylanilino-1-o-tolyl-3-methylpyrazole has m. p. 67°. 5-Acetylanilino-1-p-tolyl-3-

methylpyrazole, $\text{N} \begin{array}{l} \text{N}(\text{C}_7\text{H}_7) \cdot \text{N} \\ \text{C} \begin{array}{l} \text{CH} \\ \text{CMe} \end{array} \end{array}$ and the corresponding benzoyl derivative have m. p. 84° and 114° respectively. C. S.

Substituted Iminopyrines. AUGUST MICHAELIS (*Annalen*, 1911, 385, 44—102. Compare preceding abstract).—The chief object of the research is an investigation of various iminopyrines and their derivatives, in order to show that the substances represented by the constitutions (I) and (II) are isomeric and not identical.

m. p. 158° (ethyl ester, m. p. 46°; chloride, m. p. 96°), is obtained by heating ethyl 1-phenyl-5-pyrazolono-3-carboxylate with phosphoryl chloride and benzene at 160—170°. The action of chlorine or bromine on its acetic acid solution yields

4:5-dichloro-1-phenylpyrazole-3-carboxylic acid, m. p. 214°, and 5-chloro-4-bromo-1-phenylpyrazole-3-carboxylic acid, m. p. 222°, respectively. When heated at 200—210°, the chlorophenylpyrazolecarboxylic acid yields 5-chloro-1-phenylpyrazole, which is also conveniently prepared by heating 1-phenyl-5-pyrazolone and phosphoryl chloride at 140—150°. The bromination of 5-chloro-1-phenylpyrazole in acetic acid yields 5-chloro-4-bromo-1-phenylpyrazole, m. p. 65°; 4:5-dichloro-1-phenylpyrazole, m. p. 48°, which cannot be prepared in a similar manner, is obtained by heating 5-chloro-1-phenylpyrazole and phosphorus pentachloride at 150—160°. 3:4:5-Trichloro-1-phenylpyrazole, m. p. 82°, is prepared by chlorinating Michaelis and Rohmer's 3:5-dichloro-1-phenylpyrazole in chloroform or by heating it with phosphorus pentachloride at 150°. 3:5-Dichloro-4-bromo-1-phenylpyrazole, m. p. 85°, is prepared by brominating the dichlorophenylpyrazole. 3:5-Dibromo-1-phenylpyrazole, m. p. 50°, prepared by heating 3-hydroxy-1-phenyl-5-pyrazolone (Michaelis and Schenk, Abstr., 1907, i. 566) with phosphoryl bromide at 120—130°, yields 3:4:5-tribromo-1-phenylpyrazole, m. p. 122°, by bromination in boiling acetic acid.

5-Chloro-1-phenylpyrazole 2-methiodide, $\text{NPh} \begin{array}{l} \text{CH}=\text{CH} \\ \text{N}(\text{MeI})\text{CH} \end{array}$, m. p. 161° (decomp.), is obtained from its constituents and a little methyl alcohol at 100°. The corresponding methochloride, m. p. 147°, forms a platinichloride, $2\text{C}_{10}\text{H}_9\text{N}_2\text{Cl}_2\text{PtCl}_6 \cdot 11\text{H}_2\text{O}$, m. p. 207°, and a picrate, m. p. 106°. The ethiodide, m. p. 209°, ethochloride, m. p. 181° (platinichloride, m. p. 217°), and propiodide, m. p. 156° (decomp.), are also mentioned.

2:5-Anilo-1-phenyl-2-methylpyrazole, $\begin{array}{l} \text{CH}:\text{NMe} \\ \text{NPh} \\ \text{CH}:\text{C} \end{array} \text{NPh}$, m. p. 128°,

prepared by the general method of heating 5-chloropyrazole-2-alkylidides and primary aromatic bases (preceding abstract), forms a hydrochloride, platinichloride, m. p. 177°, hydriodide, m. p. 161° (identical with 5-anilo-1-phenylpyrazolone-2-methiodide [preceding abstract]), thiocyanate, m. p. 137°, picrate, m. p. 104°, methiodide, $\begin{array}{l} \text{CH}:\text{C}(\text{MeI}) \\ \text{CH}:\text{C}(\text{NPhMe}) \end{array} \text{NPh}$, m. p. 124—125°, ethiodide, m. p. 146°, and benzoyl iodide, $\text{C}_{10}\text{H}_{15}\text{N}_3\text{C}_6\text{H}_5\text{COI}$, m. p. 108°. 2:5-Anilo-1-phenyl-2-ethylpyrazole, m. p. 155°, and 2:5-anilo-1-phenyl-2-propylpyrazole, m. p. 124.5°, are prepared by the general method; the former forms a platinichloride, m. p. 197°, hydriodide, m. p. 149°, picrate, m. p. 172°, and methiodide, m. p. 119°, whilst the platinichloride and hydriodide of the latter have m. p. 195° and 165° respectively.

[With ERICH WURL and FELIX DOEFMANN.]—2:5-m-Nitro-anilo-1-phenyl-2:3-dimethylpyrazole (2:5-m-nitroanilopyrine) (annexed formula), m. p. 114°, garnet-red crystals, and 2:5-p-nitroanilopyrine, m. p. 129°, dark red crystals with a green shimmer, are obtained from antipyrine chloride and the nitroanilines

by the general method. The former forms a *platinichloride*, $\text{C}_{17}\text{H}_{18}\text{O}_2\text{N}_4\text{H}_2\text{PtCl}_6 \cdot 3\frac{1}{2}\text{H}_2\text{O}$, m. p. 204° (decomp.), *hydriodide*, m. p. 164°, *methiodide*, m. p. 144°, *acetyl iodide*, m. p. 196° (decomp.), and *benzoyl iodide*, m. p. 178°, whilst

2:5-*p*-nitroanilopyrine forms a *platinichloride*, m. p. 217°, *hydriodide*, m. p. 198° (decomp.), and *methiodide*, m. p. 194° (decomp.) (compare this vol. i, 232, for the isomeric nitro-anilopyrines and their derivatives). 2:5-*o*-Nitro-*p*-tolylimino-1-phenyl-2:3-dimethylpyrazole (formula I), m. p. 100°, stout, red crystals, forms a

platinichloride, m. p. 131°, and *picrate*, m. p. 145°. 2:5-*m*-Aminoanilo-1-phenyl-2:3-dimethylpyrazole (formula II), m. p. 45–50°, can be prepared by reducing the nitro-compound, but is far more conveniently obtained by heating antipyrine chloride and acetyl-*m*-phenylenediamine at 125–130° and hydrolysing the resulting acetyl derivative, m. p. 212°. It forms a *dihydrochloride*,

decomp. 260°, *platinichloride*, decomp. 227°, *benzoyl derivative*, m. p. 172°, and *benzoyl iodide*, m. p. 218°, the *hydrochloride*,

of which has m. p. 222°. 2:5-*p*-Aminoanilo-1-phenyl-2:3-dimethylpyrazole, m. p. 112°, prepared by similar methods as the meta-isomeride, forms a *dihydrochloride*, m. p. 245°, and an *acetyl derivative*, m. p. 196°, the *hydriodide* of which has m. p. 151°.

o-Dimethyl-*p*-phenylenediamine and antipyrine chloride react best at 125° to form 2:5-*p*-dimethylaminoanilo-1-phenyl-2:3-dimethylpyrazole, m. p. 120°, green plates or greenish-yellow prisms, which is a very strong base, absorbs carbon dioxide, and forms two series of salts, according as one equivalent of an acid combines with the dimethylamino-group, or as yet another equivalent breaks the bridge; the former salts are green, faintly alkaline, and contain H_2O , whilst the latter are colourless, faintly acidic, and anhydrous. The *dihydrochloride*, m. p. 224°, *dihydriodide*, m. p. 208°, *hydrochloride*, m. p. 116°, *hydriodide*, m. p. 72–73°, *dimethiodide*, m. p. 205°, and *methiodide*, m. p. 153°, are described. The action of sodium nitrite (3 mols.) on 2:5-*p*-dimethylaminoanilopyrine in acetic acid yields formaldehyde

orange-yellow leaflets, which is converted by reduction into 2:5-*p*-methylaminoanilo-1-phenyl-2:3-dimethylpyrazole, m. p. 143°, sulphur-yellow needles (*acetyl derivative*, m. p. 142°). The *nitrosoamine*, m. p. 164°, dark red needles (*hydriodide*, m. p. 192°), of 4-nitro-2:5-*p*-methylaminoanilo-1-phenyl-2:3-dimethylpyrazole is obtained by passing nitrous fumes into an alcoholic solution of the preceding nitrosoamine containing a little acetic acid.

m-Phenylenedis-2:5-imino-1-phenyl-2:3-dimethylpyrazole (annexed formula), m. p. 204°, yellowish-white crystals, is obtained by heating *m*-phenylenediamine and antipyrine chloride at 130–135°, and forms a *platinichloride*, decomp. 300°, *dihydride*, m. p. 203°, and *methiodide*, m. p. 154°.

[With WILHELM THOMAS and FRITZ ISERT.]—2:5-*p*-Chloroanilo-1-phenyl-2:3-dimethylpyrazole, $\begin{array}{c} \text{CH}=\text{C} \\ | \\ \text{NPh} \\ | \\ \text{CMe:NMe} \end{array} \text{N} \cdot \text{C}_6\text{H}_4\text{Cl}$, m. p. 78°,

yellow prisms, is obtained by heating *p*-chloroaniline (2 mols.) and antipyrine chloride or 5-chloro-1-phenyl-3-methylpyrazole-2-methiodide on the water-bath. It forms a *hydrochloride*, *platinichloride*, m. p. 89° (decomp. in its 6H₂O of crystallisation), *hydriodide*, m. p. 189°, *picrate*, m. p. 147°, *methiodide*, m. p. 192°, *ethiodide*, m. p. 172°, and *benzoyl iodide*, m. p. 183°. 2:5-*m*-*p*-Dichloroanilo-1-phenyl-2:3-dimethylpyrazole, a yellow oil (*picrate*, m. p. 152°; *methiodide*, m. p. 191°, 2:5-*p*-bromoanilo-1-phenyl-2:3-dimethylpyrazole, m. p. 81° (*platinichloride*, m. p. 115°; *hydriodide*, m. p. 206°; *picrate*, m. p. 159°; *methiodide*, m. p. 193°; *ethiodide*, m. p. 176°), and 2:5-*m*-bromoanilo-1-phenyl-2:3-dimethylpyrazole, a yellow oil (*platinichloride*, m. p. 211°; *hydriodide*, m. p. 205°; *picrate*, m. p. 190°; *methiodide*, m. p. 133°; *ethiodide*, m. p. 118°), have also been prepared.

1-*p*-Chlorophenyl-3-methyl-5-pyrazolone, m. p. 88°, is obtained by heating equal molecular quantities of *p*-chlorophenylhydrazine and ethyl acetoacetate in 50% acetic acid at 100°. Its *methiodide*, m. p. 233° (decomp.), reacts with an excess of aniline at 110° to form 1-*p*-chloroanilo-1-phenyl-2:3-dimethylpyrazole (annexed formula), m. p. 96°, yellow needles (*hydrochloride*, m. p. 200°; *platinichloride*, m. p. 192°; *hydriodide*, m. p. 189°; *picrate*, m. p. 192°; *methiodide*, m. p. 70° [hydrated] or 159° [anhydrous]; *methochloride*, m. p. 155°).

1-*p*-Bromoanilo-1-phenyl-2:3-dimethylpyrazole, m. p. 119°, forms a *hydrochloride*, m. p. 202–203°, *platinichloride*, decomp. 202°, *aurichloride*, m. p. 166°, *hydriodide*, m. p. 176°, *picrate*, m. p. 193°, *methochloride*, m. p. 157°, and *methiodide*, m. p. 101° (hydrated) and 158° (anhydrous).

[With WALDEMAR MENZEL.]—The 2:5-tolylimino-1-phenyl-2:3-dimethylpyrazoles have been prepared by the general method from antipyrine chloride and *o*- or *p*-toluidine (2 mols.) at 125°. 2:5-*p*-Tolylimino-1-phenyl-2:3-dimethylpyrazole (annexed formula), m. p. 106°, white leaflets, forms a *hydrochloride*, m. p. 207°, *platinichloride*, m. p. 138°, *hydriodide*, m. p. 166°, *picrate*, m. p. 144°, *methiodide*, m. p. 187°, *acetyl iodide*, m. p. 166°, and *benzoyl iodide*, m. p. 207°. 2:5-*o*-Tolyl-

2-amino-1-phenyl-3:3-dimethylpyrazole, m. p. 69°, forms a *hydriodide*, m. p. 157°, and *methiodide*, m. p. 192°. The isomeric *1-p*- and *o*-tolyl-*isotolypyrines* have been prepared from aniline (2 mols.) and *1-p*- or *o*-tolylantipyrine chloride at 125°. *2:5-Anilo-1-p-tolyl-3:3-dimethylpyrazole*, m. p. 106°, forms a *platinichloride*, m. p. 210°, *hydriodide*, m. p. 165.5°, *picrate*, m. p. 169°, *methiodide*, m. p. 175°, *acetyl iodide*, m. p. 306°, and *benzoyl iodide*, m. p. 147°, whilst *2:5-anilo-1-o-tolyl-3:3-dimethylpyrazole*, m. p. 129°, yields a *hydriodide*, m. p. 196°, and *methiodide*, m. p. 167°. C. S.

Ethyl Arylazoacetonedicarboxylates and their Isomeric Condensation Products with Hydrazines. CARL BÜLOW and HERMANN GÖLLER (*Ber.*, 1911, 44, 2835—2847).—The reaction between a diazonium salt and ethyl acetonedicarboxylate in cold aqueous alcohol in the presence of sodium acetate yields *ethyl arylazoacetonedicarboxylates*, $R \cdot N_2 \cdot CH(CO_2Et) \cdot CO \cdot CH_2 \cdot CO_2Et$, which are yellow, crystalline substances soluble in dilute alkalis: $R = Ph$, m. p. 43.5°; $R = o\text{-}C_6H_7$, m. p. 80—85°, decomp. 195°; $R = p\text{-}C_6H_7$, m. p. 81—81.5°; $R = m\text{-}C_6H_4Me$, m. p. 71—72°; $R = o\text{-}(C_6H_4 \cdot CO_2H)$, m. p. 145—146°. These substances react with phenylhydrazine in glacial acetic acid at the ordinary temperature to form *ethyl 5-hydroxy-1-phenylpyrazole-3-glyoxylate-arylhydrazones*,

$R = Ph$, m. p. 137—138°; $R = o\text{-}C_6H_7$, m. p. 171° (decomp.); $R = p\text{-}C_6H_7$, m. p. 170—171° (decomp.); $R = m\text{-}C_6H_4Me$, m. p. 151°; $R = o\text{-}C_6H_4 \cdot CO_2H$, m. p. 218—219° (decomp.). These compounds, which are yellow and crystalline, are given the constitution stated, because they respond to the Bülow reaction, and are soluble in dilute alkalis or aqueous piperidine. In a similar manner, the ethyl arylazoacetonedicarboxylates react with 60% hydrazine hydrate to form yellow, crystalline ethyl 5-hydroxypyrazole-3-glyoxylate-arylhydrazones, $\begin{array}{c} NH \\ | \\ C(OH) : CH \end{array} > C \cdot C(CO_2Et) : N \cdot NHR$; $R = Ph$, m. p. 170—171° (decomp.); $R = o\text{-}C_6H_7$, m. p. 162°; $R = p\text{-}C_6H_7$, m. p. 180—181° (decomp.); $R = m\text{-}C_6H_4Me$, m. p. 207—208° (decomp.); $R = o\text{-}C_6H_4 \cdot CO_2H$, decomp. 255°, darkening at 235°.

The two preceding groups of compounds are isomeric with the ethyl 4-arylazo-5-hydroxy-1-phenylpyrazole-3-acetates or ethyl 4-arylazo-5-hydroxypyrazole-3-acetates obtained by condensing ethyl 5-hydroxy-1-phenylpyrazole-3-acetates or ethyl 5-hydroxypyrazole-3-acetates respectively with diazonium salts in the presence of sodium acetate; thus ethyl 5-hydroxy-1-phenylpyrazole-3-acetate and *p*-toluenediazonium chloride yield *ethyl 4-p-toluenazo-5-hydroxy-1-phenylpyrazole-3-acetate*, $NPh \begin{array}{c} N \\ | \\ C(OH) : C \cdot N_2 \cdot C_6H_7 \end{array} > C \cdot CH_2 \cdot CO_2Et$, m. p. 132—134°, orange needles, which is soluble in dilute alkalis or aqueous piperidine; its constitution is proved by the fact that the *acid*, obtained by its hydrolysis by 10% alkali, loses carbon dioxide at 175—180°, yielding Lapworth's 4-*p*-toluenazo-5-hydroxy-1-phenyl-3-methylpyrazole. The constitution of

ethyl 4-*p*-nitrobenzenesazo-5-hydroxy-1-phenylpyrazole-3-acetate, prepared by the preceding or by Bülow and Höpfner's method (Abstr., 1901, i, 239), has been similarly proved by converting the substance into 4-*p*-nitrobenzenesazo-5-hydroxy-1-phenyl-3-methylpyrazole. C. S.

Quadrirates. WILHELM E. RINGER (*Zeitsch. physiol. Chem.*, 1911, 75, 13—18. Compare Kohler, this vol., i, 243, 690; also Ringer, Abstr., 1910, ii, 838).—It is considered that the non-existence of quadrirates has not been proved as yet. The possibility of the formation of mixed crystals of urates and uric acid is suggested. On cooling such a mixture, the solid would remain in presence of its mother liquor for a time, although not in equilibrium with it, and will less in equilibrium with water. In time, decomposition and liberation of part of the uric acid would take place. The mixed crystals formed on evaporation at a constant temperature are in equilibrium with the mother liquors; they therefore do not decompose when kept, and decompose only very slowly in presence of water at the same temperature. Such substances would correspond in composition with the quadrirates without being true chemical compounds. E. F. A.

Benziminazoles and Benzoxazoles and Azo-dyes Derived Therefrom. OTTO KYM and S. KOWARSKI (*Ber.*, 1911, 44, 2919—2932. Compare Abstr., 1904, i, 453).—The effect on the colour and affinity for vegetable fibres of an increasing number of amino-groups in azo-dyes of this class has been investigated already, and in this paper the effect in this direction of introducing (a) a second iminazole group or (b) a second oxazole group, is shown to be the production of a red tone in the dyo, with no increase in the affinity for cotton.

3-Nitro-1:4-di-*p*-nitrobenzoyl-*p*-phenylenediamine,

m. p. above 305°, prepared by the action of *p*-nitrobenzoyl chloride on either nitro-*p*-phenylenediamine or nitrodiacetyl-*p*-phenylenediamine, crystallises from pyridine on adding hot alcohol in glancing, golden yellow leaflets. On nitration with fuming nitric acid, it gives 2:3-dinitro-1:4-di-*p*-nitrobenzoyl-*p*-phenylenediamine, m. p. 262°, which may also be obtained by the action of *p*-nitrobenzoyl chloride on dinitrodiacetyl-*p*-phenylenediamine. This crystallises from acetone on addition of water in small, yellow needles, is much more soluble in organic solvents than the mononitro-compound, and on reduction with tin and hydrochloric acid furnishes the corresponding 2:5-di-*p*-aminophenyl-*o*-benzdi-iminazole,

which sinters at 230°, losing water of crystallisation, and then melts at 255°; it crystallises from pyridine on addition of water in bright brown, glancing needles, and shows a bluish-violet fluorescence in all solutions. The diacetyl derivative is colourless and practically insoluble in all solvents.

4:6-Dinitroresorcinyl di-*p*-nitrobenzoate, m. p. 178°, prepared by treating dinitroresorcinol with *p*-nitrobenzoyl chloride, crystallises in

slender, yellowish-brown needles from boiling acetic acid on addition of water, and is insoluble in acetone or pyridine, but appears to undergo change in the latter solvent, since addition of water causes the separation of an intensely yellow jelly. On reduction with stannous chloride, tin, and hydrochloric acid, it furnishes a 5% yield of 1:5-di-*p*-aminophenylbenzodioxazole,

which sinters at 170° and remains unchanged on further heating, crystallises from hot acetone on addition of water in small, brown needles, and shows a bluish-violet fluorescence in alcohol. The same substance was obtained in larger yield in the following series of reactions.

When 4:6-diaminoresorcinol hydrochloride is heated with *p*-nitrobenzoyl chloride in xylene solution, *di-p*-nitrobenzoylaminoresorcinol, $\text{C}_6\text{H}_4(\text{OH})_2(\text{NH} \cdot \text{CO} \cdot \text{C}_6\text{H}_4 \cdot \text{NO}_2)_2$, is obtained as an orange-coloured, insoluble, sandy powder, which does not melt at 300°, but on heating at 260–270° is converted into 1:5-di-*p*-nitrophenylbenzodioxazole, which alone is formed if the initial reaction is carried out in nitrobenzene solution instead of xylene. This has m. p. above 300°, forms small, bright yellow needles, and is insoluble in acids or alkalis, but can be recrystallised from nitrobenzene. On reduction by heating with zinc dust and acetic acid, it gave the corresponding 1:5-di-*p*-aminophenylbenzodioxazole described above.

The diaminobenzdi-iminazole and diaminobenzdioxazole bases here described were diazotised and coupled with aminonaphtholdisulphonic acid, β -naphtholdisulphonic acid, and α -naphthol, and gave in each case dyes which on cotton furnished colours distinctly redder in shade than those given by the corresponding products from the monodiaminazole and mono-oxazole respectively.

T. A. H.

Azoxy-compounds. ANGELO ANGELI and LUIGI ALESSANDRI (*Atti R. Accad. Lincei*, 1911, [v], 20, ii, 170–176. Compare this vol., i, 817).—The *p*-nitroazoxybenzene of Ziinin is unaltered when treated with nitric acid (D 1.48) for four minutes at room temperature (27°), whilst under these conditions the compound of m. p. 148° (now given as 149°), previously described, yields 4:4'-dinitroazoxybenzene, which is only formed from Ziinin's compound when the action of the nitric acid is prolonged. Both substances remain unaltered when treated with bromine in glacial acetic acid, but if they are mixed with a little iodine and added to bromine, Ziinin's compound is unacted on, whilst from the other a bromo-derivative is produced, crystallising in yellow prisms, m. p. 199°. Azoxybenzene in similar circumstances gives a bromo-derivative, m. p. 75°.

R. V. S.

Action of Phosphorus Pentachloride on the Azoxy-compounds. G. CHARRIER and G. FERRERI (*Atti R. Accad. Sci. Torino*, 1911, 46, 1009–1023).—The authors have studied the action of phosphorus pentachloride on the azoxy-compounds obtained by uniting β -naphthol with *o*- and *p*-methoxyphenyldiazonium chloride, and with *o*- and *p*-ethoxyphenyldiazonium chloride. They find that in the case of

the compounds from *p*-anisidine and *p*-phenetidine, the hydroxy- group is substituted by chlorine. The derivatives of *o*-anisidine and *o*-phenetidine, however, behave differently; hydrogen chloride and methyl or ethyl chloride are evolved, and a compound containing phosphorus and chlorine is obtained, for which the formula $\begin{array}{c} \text{N} \cdot \text{C}_6\text{H}_4 \cdot \text{O} \\ \text{N} \cdot \text{C}_{10}\text{H}_6 \cdot \text{O} \end{array} \text{PCl}_2$ is sug-

gested. This substance yields *o*-hydroxybenzeneazo- β -naphthol when treated with water. In addition, all the azoxy-compounds give small quantities of infusible substances containing phosphorus.

o-Methoxybenzeneazo- β -naphthol, $\text{OH} \cdot \text{C}_{10}\text{H}_6 \cdot \text{N} \cdot \text{N} \cdot \text{C}_6\text{H}_4 \cdot \text{OMe}$, forms yellowish-red needles, m. p. 178°. It dissolves in concentrated sulphuric acid, giving a reddish-violet coloration.

o-Ethoxybenzeneazo- β -naphthol, $\text{C}_{10}\text{H}_6\text{O}_2\text{N}_2$, crystallises in minute, orange-red leaves, m. p. 138°. It gives a reddish-violet coloration with concentrated sulphuric acid.

o-Hydroxybenzeneazo- β -naphthol crystallises in three forms: (1) green tablets (from ethyl alcohol and ethyl acetate); (2) in crystals of small, red needles (from benzene and toluene); (3) red needles with a golden lustre (from methyl alcohol). The last two forms change into the first in contact with alcohol or on heating. The sodium salt, $\text{C}_{16}\text{H}_{11}\text{O}_2\text{N}_2\text{Na} \cdot 3\text{H}_2\text{O}$, and the potassium salt, $\text{C}_{16}\text{H}_{11}\text{O}_2\text{N}_2\text{K} \cdot 1\frac{1}{2}\text{H}_2\text{O}$, which both crystallise in green scales, were prepared. The acetyl derivative, $\text{C}_{16}\text{H}_{11}\text{O}_2\text{N}_2$, forms ruby-red needles, m. p. 153°. The benzoyl derivative, $\text{C}_{22}\text{H}_{15}\text{O}_3\text{N}_2$, forms small, orange-yellow needles, m. p. 216°. The benzyl derivative, $\text{C}_{23}\text{H}_{15}\text{O}_3\text{N}_2$, crystallises in small, red needles, m. p. 152–153°.

p-Methoxybenzeneazo- β -naphthol, $\text{C}_{17}\text{H}_{11}\text{O}_2\text{N}_2$, forms red needles, m. p. 137°. It dissolves in concentrated sulphuric acid, giving a reddish-violet coloration, and is reprecipitated on addition of water. When it is heated with an equimolecular quantity of phosphorus pentachloride on the water-bath, 1-*p*-methoxybenzeneazo-2-chloronaphthalene, $\text{C}_{10}\text{H}_6\text{Cl} \cdot \text{N} \cdot \text{N} \cdot \text{C}_6\text{H}_4 \cdot \text{OMe}$, is produced; it crystallises in small, orange-red prisms or lustrous, reddish-yellow scales, m. p. 87°. It gives a reddish-violet coloration with concentrated sulphuric acid. On reduction with zinc and acetic acid, it yields *p*-anisidine and 2-chloro-1-naphthylamino, of which the monoacetyl derivative, $\text{C}_{17}\text{H}_{10}\text{ONCl}$, crystallises in colourless needles, m. p. 191°, and the diacetyl derivative, $\text{C}_{17}\text{H}_{12}\text{O}_2\text{NCl}$, forms colourless prisms, m. p. 88°. With nitrous acid, 2-chloro-1-naphthylamine yields in solution 2-chloro-1-naphthyl-diazonium chloride, which reacts with β -naphthylamine to form 2-chloro-1-naphthaleneazo-2'-naphthylamine, $\text{C}_{10}\text{H}_6\text{Cl} \cdot \text{N} \cdot \text{N} \cdot \text{C}_{10}\text{H}_6 \cdot \text{NH}_2$, which crystallises in red needles, m. p. 125°; this substance dissolves in concentrated sulphuric acid with production of an intense blue coloration. 2-Chloro-1-naphthyl-diazonium chloride and β -naphthol yield 2-chloro-1-naphthaleneazo- β -naphthol, $\text{C}_{10}\text{H}_6\text{Cl} \cdot \text{N} \cdot \text{N} \cdot \text{C}_{10}\text{H}_6 \cdot \text{OH}$, which forms minute, red needles, m. p. 177°, and gives a bluish-violet coloration with concentrated sulphuric acid.

p-Ethoxybenzeneazo- β -naphthol, $\text{OH} \cdot \text{C}_{10}\text{H}_6 \cdot \text{N} \cdot \text{N} \cdot \text{C}_6\text{H}_4 \cdot \text{OEt}$, crystallises in red needles, m. p. 132°; it dissolves in concentrated sulphuric acid, giving a reddish-violet coloration, and is reprecipitated on addition of water. 1-*p*-Ethoxybenzeneazo-2-chloronaphthalene,

$C_6H_5ON_2Cl$, crystallises in orange-yellow leaflets, m. p. 94° , and gives a violet coloration with concentrated sulphuric acid. R. V. S.

Behaviour of Some Nitroazo-derivatives Towards Phenylhydrazine. C. GASTALDI (*Gazzetta*, 1911, 41, ii, 319–324. Compare *Revue Abstr.*, 1909, i, 443).—*o*-Nitrobenzoylazobenzene, $NO_2 \cdot C_6H_4 \cdot CO \cdot N \cdot NPh$,

is obtained by the action of nitrous anhydride on an ethereal suspension of *o*-nitrobenzoylphenylhydrazine; it crystallises in red needles, m. p. 89° , and is reduced by phenylhydrazine to *o*-nitrobenzoylphenylhydrazine.

m-Nitrobenzoylphenylhydrazine, $NO_2 \cdot C_6H_4 \cdot CO \cdot NH \cdot NHPh$, is obtained by acting on an ethereal solution of phenylhydrazine with *m*-nitrobenzoyl chloride; it forms yellow laminae, m. p. 158° (Autenrieth gave 205° ; compare *Abstr.*, 1901, i, 186).

m-Nitrobenzoylazobenzene, $C_{13}H_9O_3N_3$, crystallises in dark red laminae, m. p. 117° , and is reduced to *m*-nitrobenzoylphenylhydrazine by phenylhydrazine.

p-Nitrobenzoylazobenzene, $C_{13}H_9O_3N_3$, forms small, red laminae, m. p. 136° , and is similarly reduced by phenylhydrazine.

o-Nitrobenzoyl-*p*-bromophenylhydrazine,

(from *p*-bromophenylhydrazine and *o*-nitrobenzoyl chloride), crystallises in colourless needles tinged with yellow, and has m. p. 193° . When oxidised it gives *o*-nitrobenzoylazo-*p*-bromobenzene, m. p. 119 – 120° , which is, however, not pure.

m-Nitrobenzoyl-*p*-bromophenylhydrazine, $C_{13}H_{10}O_3N_3Br$, crystallises in pale yellow needles, m. p. 198° . *m*-Nitrobenzoylazo-*p*-bromobenzene, $C_{11}H_8O_3N_3Br$, forms bronze-coloured laminae, m. p. 124° , and is reduced to *m*-nitrobenzoyl-*p*-bromophenylhydrazine by phenylhydrazine.

p-Nitrobenzoyl-*p*-bromophenylhydrazine, $C_{13}H_{10}O_3N_3Br$, crystallises in yellow needles, m. p. 194° . *p*-Nitrobenzoylazo-*p*-bromobenzene,

crystallises in bronze-coloured laminae, m. p. 153° , and is reduced to *p*-nitrobenzoyl-*p*-bromophenylhydrazine by phenylhydrazine.

R. V. S.

Preparation of Bromonaphthalene-1-diazo-2-oxide-4-sulphonic Acid. CHEMISCHE FABRIK VORM. SANLOZ (D.R.P. 256656).—When naphthalene-1-diazo-2-oxide-4-sulphonic acid is dissolved in concentrated sulphuric acid or chlorosulphonic acid, treated with bromine, and heated at 60 – 65° , bromination takes place, yielding bromonaphthalene-1-diazo-2-oxide-4-sulphonic acid, decomp. 180° ; the zinc salt forms glistening, greenish-yellow needles.

F. M. G. M.

Nitrogen Chains: Diazohydrazides from Diazotetrazole. KARL A. HOFMANN and HEINRICH HOCK (*Ber.*, 1911, 44, 2946–2956. Compare *Abstr.*, 1910, i, 446, 547; this vol., i, 359).—Diazotetrazole-aminoguanidine (guanyltetrazyltetrazen),

prepared as already described (Abstr., 1910, i, 446), crystalline in yellow, doubly refractive needles, is stable in air at 25–35°, and decomposes with slight explosion at 142°. It is acid to litmus, but dissolves in dilute nitric acid. It does not react with mercuric oxide or benzaldehyde, but Fehling's solution furnishes copper diamminotetrazole (!) as a brown powder. Sodium hydroxide decomposes it into cyanamide, ammonia, and tetrazylazoimide. When heated with dilute sulphuric or nitric acid, cyanogen and nitrogen are evolved, and the residue contains aminoguanidine and its decomposition products, as well as aminotetrazolic acid. The *periodide*, $C_4H_4N_8I_2$, which forms brown to black, pleochroic, cubical crystals, explodes gently when heated, but very violently in contact with nitric acid and silver nitrate.

Diazotetrazole-semicarbazide, $NH_2 \cdot CO \cdot NH \cdot NH \cdot N \cdot N \cdot CN \cdot H_2$, m. p. 122°, obtained by adding diazotetrazole to semicarbazide hydrochloride in aqueous solution in presence of sodium acetate, forms colourless, doubly-refractive crystals when dilute nitric acid is added to its solution in alkali. It is acid to litmus, and is only slowly decomposed by alkali, forming tetrazylazoimide and carbamide. The same products result from heating the substance with water or dilute acids.

The decompositions of these two substances are in harmony with the constitution assigned to them (compare Curtius, Abstr., 1893, i, 463; Wohl, Abstr., 1893, i, 509; Thiele and Marais, Abstr., 1893, i, 440).

Diazotetrazolebenzylideneaminoguanidine,

obtained by admixture of its components in acetic acid, is an orange-red substance, decomposes at 132°, and crystallises in groups of needles from alcohol by evaporation of its solution under reduced pressure. It is decomposed by acids, yielding nitrogen, cyanogen, benzaldehyde, and hydrazine. With concentrated sodium hydroxide solution it gives a *sodium* derivative, orange-red needles. *Diazotetrazolephenylhydrazide*, $NH_2 \cdot NPh \cdot N \cdot N \cdot CN \cdot H_2$, obtained by interaction of phenylhydrazine with diazotetrazole in acetic acid, separates from methyl alcohol on adding ether, in orange-red crystals, gives a brownish-red *sodium* derivative, and is decomposed by acids, yielding nitrogen, cyanogen, and phenylhydrazine. The mode of decomposition of these two compounds indicates that they are α -hydrazides; their behaviour with acids and alkalis clearly distinguishing them from the β -hydrazides represented by the first two (compare Wohl and Schiff, Abstr., 1900, i, 706).

Bisdiazotetrazolehydrazide, $HN_2 \cdot C \cdot N \cdot N \cdot NH \cdot NH \cdot N \cdot N \cdot CN \cdot H_2$, obtained by adding hydrazine hydrochloride to diazotetrazole hydrochloride, both being in strongly cooled solution, occurs in doubly refractive spangles, and can be kept for a month in a desiccator at 25°, but explodes with great violence when pressed with a glass rod or heated to 90°. It is decomposed by acids, yielding nitrogen (5 atoms), cyanogen, ammonia, and tetrazylazoimide, but no hydrazine. Concentrated sodium hydroxide solution gives a *sodium* derivative, as intensely yellow, doubly refractive plates, which in water decomposes, giving nitrogen, tetrazylazoimide, and aminotetrazole, but no

ammonia. These reactions are in harmony with the constitution assigned to the substance, as are also its acid reaction and non-reactivity with benzaldehyde. With Fehling's solution gas is evolved, the solution becomes brownish-yellow, and, on warming, reddish-brown flocks are deposited, probably of a copper derivative or diazotetrazole.

Guanidine and dicyanodiamidine react with diazotetrazole to form salts of diazoaminotetrazolic acid (compare Abstr., 1910, i, 547). The dicyanodiamidine salt forms yellow groups of microscopic needles, and dissolves in sodium hydroxide solution, from which alcohol precipitates the sodium salt, $C_2N_{11}Na_3H_4O$, doubly refractive, yellow needles. The well crystallised barium salt, $(C_2N_{11})_2Ba_3.8H_2O$, may be obtained from this by double decomposition. T. A. H.

A New Method of Preparing Diazoamino-compounds, and a New Reaction for Nitrous Acid. WILHELM VAUBEL (*Chem. Zeit.*, 1911, 133, 1238).—Sodium nitrite, in aqueous solution, acts on the salts of aromatic amines with mineral acids to form diazoamino-benzenes and its derivatives. Aniline hydrochloride and sodium nitrite yield diazoaminobenzene, the best yield of the latter being obtained when the proportions taken are 1 mol. of aniline hydrochloride and $\frac{1}{2}$ mol. of sodium nitrite. Hydrochlorides may be replaced by nitrates. Reaction proceeds more slowly when salts of different amines are mixed before addition of the nitrite.

A similar action occurs when solid sodium nitrite is added to an alcoholic solution of the amine salt, and also when the dry salts are intimately mixed. In these cases the reaction can easily become so violent that a portion of the diazoaminobenzene is decomposed.

The reaction may also be used in testing the presence of nitrites in water. The presence of 0.00035% of nitrite could be recognised by the yellow coloration formed on addition of aniline hydrochloride.

H. W.

Losses in the Isolation of Monoamino-acids [from Proteins] by the Ester Method. I. EMIL ABDERHALDEN and ARTHUR WEIL (*Zeitsch. physiol. Chem.*, 1911, 74, 445—471. Compare Osborne and Breese Jones, Abstr., 1910, i, 598).—The isolation of the monoamino-acids obtained on hydrolysing proteins is not a quantitative operation. In the case of glutamic and aspartic acids, the yields obtained, starting from the pure acids, esterifying, and converting the ester into acid again, have been determined. The experiments have been carried out in a variety of ways, and the losses at each stage of the process determined by nitrogen determinations; for the details, the original should be consulted.

Starting from pure aspartic acid, about 40% is lost during the isolation by the ester method; with glutamic acid the loss is 30%. Glutamic acid is usually isolated without the help of the ester method, and the loss in this case will not be larger, but it is considered that the values for aspartic acid previously obtained can be doubled. E. F. A.

Ochrein. FRANCESCO MARINO-ZUCO and IDA FOA (*Gazzetta*, 1911, 41, ii, 331—336).—Ochrein is the name given by the authors to the

substances containing iron which is obtained when biotoxin acts on blood or hæmoglobin (compare Marino-Zucco and Giuganino, *Abstr.*, 1910, ii, 223). It is prepared by incubating a sterile solution of biotoxin and oxyhæmoglobin for five or six days at 41°, until the absorption spectrum of hæmoglobin is no longer present, and the liquid does not become turbid on heating. The substance is an amorphous, ochre-coloured powder, insoluble in most solvents. The percentage composition of different samples is the same, and corresponds with the formula $C_{238}H_{306}O_{70}N_{79}Fe$. When heated with extremely dilute sodium hydroxide, a very small quantity of the substance dissolves, and the solution shows the spectrum which appears when biotoxin acts on blood (compare Marino-Zucco and Giuganino, *loc. cit.*). R. V. S.

3:5-Di-iodotyrosine from Iodised Protein. III. From Iodocasein. ADOLF OSWALD (*Zeitsch. physiol. Chem.*, 1911, 74, 290—296).—3:5-Di-iodotyrosine was prepared from iodocasein, but the yield is small, namely, about 1%. Iodocasein contains 10—14% of iodine; of this, only 4—5% is united to tyrosine; the amount obtained represents only about one-tenth of the tyrosine present. W. D. H.

Composition of Different Kinds of Silk. XIII. ERNST ARDERHOLDEN (*Zeitsch. physiol. Chem.*, 1911, 74, 427—428).—Silk from the cocoon of *Anaphe* contained tyrosine, alanine, and glycine in large quantity, and was similar in composition to other kinds of silk. Silk from *Bombyx mori* and African tussore silk was also qualitatively similar.

Silks as a class are very similar in composition, all consisting mainly of tyrosine, alanine, and glycine. They are not, however, identical, showing differences in the nature and amount of their rarer constituents. E. F. A.

The Proteases. EDUARD ZUNZ (*Bull. Acad. roy. Belg.*, 1911, 653—734).—The hetero- and proto-albumoses prepared by the methods of Pick, Adler, and Haslam, as well as the synalbumose and thioalbumose of Pick, were prepared in quantity, and a large number of both chemical and physical constants of the preparations were ascertained. The experimental methods are given in full detail, and the analytical results and physical constants are tabulated. Further separations were also attempted by the methods of ultra-filtration (Bechhold) and precipitation by colloids (Michaelis and Roux). It was found that the method of Pick yields products of the most constant composition, and his method of classification of the proteases appears to be preferable to that suggested by Haslam, although it can be improved in certain details in the technique of precipitation introduced by Haslam. Certain differences in the physiological action of the fractions previously observed by the author are also summarised. S. B. S.

Plastein Formation. A. RAKOCZY (*Zeitsch. physiol. Chem.*, 1911, 75, 273—281).—The Danilewski reaction is not due to the action of any specific substance, but plastein formation occurs in the case of all proteoclastic enzymes, rennet included. W. D. H.

Nomenclature of Enzymes. HANS VON EULER (*Zeitsch. physiol. Chem.*, 1911, 74, 13—14).—Enzymes are usually named after the substances they split, for instance, for example, maltase after maltose. This rule is difficult to apply to enzymes which produce syntheses. The suggestion made is that the termination in such cases should be *ase* instead of *ase*, for instance, lipase, lipase. W. D. H.

The Mode of Action of Phosphatase. HANS VON EULER and RUTEN KULLBERG (*Zeitsch. physiol. Chem.*, 1911, 74, 15—28).—There is no evidence that the enzyme which synthesises carbohydrate phosphoric acid esters has any splitting action. The term *phosphatase* is suggested (see preceding abstract); it is active in faintly alkaline media, but its stability is small. The ester formed from dextrose and levulose is optically inactive, and on decomposition by acids or bases yields no optically active products. The enzyme is found in yeast and *Aspergillus*. Two enzymes are really in all probability concerned, one which changes the dextrose or levulose into an ester-forming carbohydrate, and the second is the phosphatase which builds together the carbohydrate and phosphate ions. W. D. H.

The Electrical Transport of Pepsin. CORNELIS A. PERELHARING and WILHELM E. RINGER (*Zeitsch. physiol. Chem.*, 1911, 75, 282—289).—Using a commercial preparation of pepsin, Michaelis and Davidsohn (Abstr., 1910, i; 795) drew the conclusion that with acid of a certain strength, the pepsin travelled to both poles; on lessening the strength of acid, it went only to the cathode; with still weaker acid it again went to both poles, and finally with the weakest acid only to the anode. The preparation they used was mixed with proteoses. In the present research, the authors prepared their own pepsin from pig's stomach; they do not pretend it is absolutely pure, but at any rate it was free from any large admixture with grosser impurities. It always travelled to the anode; when, however, proteoses were added, it was carried more or less to the cathode also. No separation of pepsin from rennet occurred by this method. W. D. H.

The Influence of Hydrogen Ion Concentration on Trypsin Action. LEONOR MICHAELIS and HEINRICH DAVIDSOHN (*Biochem. Zeitsch.*, 1911, 36, 280—290).—The principles of the experiments and the methods of interpreting the results are precisely the same as those used by the authors in their investigations on the influence of hydrogen ion concentration on the action of invertin (next page). They draw the conclusion that trypsin is an amphoteric electrolyte existing in solution in the form of anions, cations, or unchanged molecules according to the $[H^+]$ concentration. Only the cations act proteo-lytically, and the trypsin action is directly proportional to the number of these present in solution. The acid dissociation constant is 5.10^{-7} . Above 10^{-8} the tryptic action diminishes, possibly owing to the formation of doubly charged inactive anions. The optimal action takes place therefore in solutions when $[H^+]$ concentration = 10^{-8} .

S. B. S.

Preparation of Pure Invertase. RICHARD O. HERZOG (*Zeitsch. physiol. Chem.*, 1911, 74, 511. Compare Euler and Kullberg, *ibid.*, 1, 825).—Polemical. Euler and Kullberg have ignored the measurements of the molecular weight of invertase from the diffusion constants made by Herzog and Kasarnowski (*Abstr.*, 1908, i, 707).
E. V. A.

The Action of Hydrogen Ions on Invertin [Invertase]. LAUREN MICHAELIS and HEINRICH DAVIDSOHN (*Biochem. Zeitsch.*, 1911, 26, 386—412).—The action of invertase on sucrose solutions was investigated in solutions with varying $[H^+]$ concentrations, and the zone of optimal action was found to occur between $[H^+] = 0.65 \times 10^{-3}$ and 0.98×10^{-3} . A standard curve was obtained when x , the amount of change (estimated polarimetrically), was plotted against t , the time of action of the ferment, the curve being constructed from the various data obtained from certain closely agreeing experiments carried out under conditions of optimal ferment action. Another curve was constructed when the ratio T/t and $\log[H^+]$ were plotted against one another, T being the time necessary to produce a given change read from the standard curve, t being the actual time taken to produce that change in the concentration $[H^+]$. The form of the curve thus obtained is similar to that of the dissociation curve of weak acids obtained by Michaelis. The conclusions drawn from the result are, that invertase is an amphoteric electrolyte with acid dissociation constant $= 2 \times 10^{-11}$ and basic dissociation constant 10^{-12} . The inverting action on sucrose is due to the presence of undissociated electrolyte, its optimum action corresponding with its isoelectric point. As k_a is greater than k_b , there is a broad isoelectric zone. Neither the cations nor the anions can act as ferments, and the action of the hydrogen ions depends, therefore, entirely on the degree of dissociation of invertase. The latter is not readily adsorbed by kaolin. Preliminary experiments on emulsin show that this is adsorbed to a greater extent than invertase.
S. B. S.

Influence of Certain Acids on the Inversion of Sucrose by Sucrase [Invertase]. FREDERICK STOWARD (*Bio-Chem. J.*, 1911, 5, 131—140).—Acids favour the inversion of sucrose by invertase. The action proceeds most rapidly when small amounts of sulphuric, hydrochloric, nitric, and phosphoric acid are present, and also in the presence of larger amounts of acetic acid. Increase of acid beyond a certain concentration, which differs in the case of different acids, retards, and finally arrests, the action.
W. D. H.

Diastase. JOSEF BURACZEWSKI, L. KRAUZE, and A. KRZEMSKI (*Bull. Acad. Sci. Cracow*, 1911, [A], 6, 369—370).—Pure commercial diastase was treated in suspension in methyl alcohol with bromine or iodine. The compounds obtained contained 6.23% Br and 9.0% I respectively. When heated with water for half an hour, a greyish-white, insoluble substance, probably a halogenated protein, remained. The soluble portion was precipitated by alcohol, and behaved as a carbohydrate, giving a blue coloration with iodine like starch. Unchanged diastase converted it first into dextrin and then into reducing sugar;

mineral acids acted similarly. The carbohydrate gave the orcinol reaction. The phenylomazone obtained from the reducing sugar had m. p. 156—157°.

Diasase which has been boiled with very dilute mineral acids gives a blue coloration with iodine. It is regarded as an unstable compound of protein and a carbohydrate of the nature of starch, which is probably a pentosan. The araban described by Wroblewski as accompanying diasase is probably a dextrin-like decomposition product of this pentosan.

E. F. A.

Action of Emulsin on Gentiopierin in Alcohol. ÉMILÉ BOCHQUELOT and MARC BRINEL (*J. Pharm. Chim.*, 1911, [vii], 4, 383—390).—It has generally been assumed that the activity of emulsin is inhibited by small quantities of alcohol (compare Bougarel, *Thèse*, Paris, 1877), but the authors find that emulsin still hydrolyses gentiopierin to a slight extent even in presence of 95° alcohol.

In alcohol at 60°, gentiopierin is hydrolysed to the extent of 77.2% in forty days, and the action then stops. In 80° alcohol the same equilibrium is reached in seventy-five days, whilst in 85° alcohol 69.1% is hydrolysed in the same time. In 90° alcohol action ceases at the end of fifty-three days, when 48.4% of the glucoside is decomposed, and in 95° alcohol no further hydrolysis takes place after the twentieth day, when 6 to 7% of the glucoside is hydrolysed.

Even after keeping ninety days in alcohol of 80° strength, emulsin is still active towards gentiopierin, although its activity is diminished by this treatment.

Emulsin is insoluble in alcohol over 50° in strength, but with progressive dilution of the alcohol with water it becomes more soluble, and saturated, filtered limpid solutions of the enzyme in 10° or 20° alcohol are almost as active as similar solutions in water. In alcohols of strength above 50°, emulsin appears therefore to act by simple contact.

T. A. H.

The Ricinus Lipase. Y. W. JALANDER (*Biochem. Zeitsch.*, 1911, 36, 435—476).—The microscopic appearance of the mixture of fat and lipase in the presence of acetic acid and water vapour is described. The lipase imbibes water, and an emulsion is formed of the colloidal hydrated particles in oil (disperse phase). Details are given as to the methods for producing the oil-enzyme-acetic acid emulsion so as to obtain the maximum enzymatic activity. With 5 mg. enzyme (prepared by a modification of Nicloux's method) and 1 gram of triolein or cotton-seed oil, the best results are produced with about 0.6 c.c. of acetic acid. The concentration of the latter can vary between *N*/500 and *N*/10 without producing appreciable variations in the results. Much depends, however, on the mechanical treatment of the mixture, about which point full experimental details are given. The ricinus powder contains a small amount of acid which can be washed away. This washed powder in the presence of water alone is only slightly active. If it is first treated, however, with *N*/10-acid, it reaches its maximal activity in the presence of water alone. The results seem to indicate that a free acid plays the activating part in the enzyme action. By keeping the purified enzyme, however, for

some time with water or acid, its activity is diminished. The purified enzyme loses its activity when kept with neutral fats alone, without the presence of either acid or water. Of the fats investigated, triolein exerts the greatest action in this respect. In experiments lasting over one hour, the Schütz law $x/\sqrt{t} = \text{constant}$ (when x = amount saponified, t = quantity of enzyme) was found to hold good over a comparatively large range. With more rapid hydrolysis, however, the law no longer held. The relationship between the time of action and the amount saponified was also investigated in numerous experiments. It was found that the relationship can be best expressed by the equation $x/t^m = \text{constant}$, when m varied between 0.57 and 0.70. No perfectly satisfactory formula could, however, be found. The lipase can also produce fats synthetically from oleic acid and glycerol. The presence of a small quantity of water, sufficient to produce the swelling of the lipase, accelerates the synthetical reaction, especially if the mixture be kept in continual rotation. S. R. S.

Synthesis of Fats by the Action of Enzymes. F. L. DUNLAP and L. O. GILBERT (*J. Amer. Chem. Soc.*, 1911, 33, 1787—1791).—Experiments are described which show that the lipase of castor oil seed is capable of effecting the synthesis of fat by its action on a mixture of glycerol and oleic acid (compare Taylor, *Univ. California Pub., Path.*, 1904, 1, 33, and Welter, this vol., i, 409). E. G.

Extraction of Zymase from Fresh Brewers' Yeast by Plasmolysis. P. RINCKLEBEN (*Chem. Zeit.*, 1911, 35, 1149—1150).—Brewers' yeast was incubated with glycerol (25 c.c. to 400 grams yeast) at 25° for fifteen to forty hours, whereby the yeast was plasmolysed and the mass became liquid. By filtering through hardened filter-paper, a liquid was obtained which, as a rule, was without fermentative activity. In a few cases, however, the liquid readily fermented sugars, whilst in others it was only active after the addition of a boiled yeast-juice. The last cases thus owed their inactivity to a disappearance of the co-enzyme of alcoholic fermentation during the plasmolysis.

An active liquid was also obtained when yeast was plasmolysed by means of disodium hydrogen phosphate in the presence of boiled yeast-juice which had previously been dried in a vacuum.

W. J. Y.

***p*-Aminophenylarsine Tetraiodide.** ALDO PATTÀ and PIERO CACCIA (*Boll. Soc. Med. Chir. Pavia*, 1911; Reprint, 9 pp. Compare Mameli and Pattà, *Abstr.*, 1909, i, 543; 1910, i, 531; also Berthelm, this vol., i, 593).—*p*-Aminophenylarsine tetraiodide hydriodide, $\text{AsI}_4 \cdot \text{C}_6\text{H}_4 \cdot \text{NH}_2 \cdot \text{HI}$, is obtained when *p*-aminophenylarsinic acid is heated with hydriodic acid (D 1.7) until iodine vapour is evolved in moderation; it forms orange-red crystals, m. p. 140°, and give a white, insoluble substance on treatment with water. The toxicity of this tetraiodide does not differ greatly from that of the stoxyl derivatives of Mameli and Pattà (*loc. cit.*), but its injection produces a marked local action. R. V. S.

Preparation of Arsenophenols. FARBERKE VORM. MEISTER, LUCIUS & BAUMING (D.R.-P. 235430. Compare Abstr., 1909, i, 347; 1910, i, 453).—The reduction of hydroxyarylarsonic acids has been previously described, and the preparation of halogenated derivatives is now recorded. When sodium *p*-hydroxyphenylarsinite is treated with sodium hypochlorite (or hypobromite) in aqueous solution at the ordinary temperature, and the solution acidified after twelve hours, the dihalogenated acid (accompanied by trihalogenated phenol) separates; it crystallises from water, and does not melt below 260°. *p*-Di-iodohydroxyphenylarsinic acid is obtained when sodium *p*-hydroxyphenylarsinite (285 parts) is treated with potassium iodate (250 parts) in dilute sulphuric acid solution, heated at 100°, and potassium iodide (220 parts) subsequently added; on cooling the product separates in crystalline form.

Tetrachloroarsenophenol, a yellow powder insoluble in water, is prepared by treating the foregoing dichloro-acid with alkaline sodium hyposulphite in the presence of magnesium chloride at 50° for some time; the corresponding *tetrabromo*- and *tetraiodo*-arsenophenols can be analogously prepared, have similar properties, and are decomposed at 300° into arsenophenol.

F. M. G. M.

Preparation of Aminohydroxyarylarsonic Oxides. FARBERKE VORM. MEISTER, LUCIUS & BAUMING (D.R.-P. 235391. Compare Abstr., 1909, i, 148).—*Aminohydroxyphenylarsenous oxide* separates as a colourless, microcrystalline powder when a very dilute sulphuric acid solution of aminophenolarsinic acid (Abstr., 1909, i, 804) is treated with potassium iodide, saturated with sulphur dioxide at the ordinary temperature, and subsequently rendered alkaline with ammonium hydroxide; it is somewhat soluble in water, readily so in mineral acids and alkali hydroxides.

F. M. G. M.

Nitro- and Amino-arsanilic Acids. ALFRED BERTHEIM (*Ber.*, 1911, 44, 3092—3098).—The toxicity of phenylarsinic acid is considerably diminished by the entrance of an amino-group into the benzene nucleus. A similar effect accompanies the introduction of a second amino-group, the toxicity of 3:4-diaminophenylarsinic acid being only one-twentieth that of *p*-aminophenylarsinic acid.

p-Oxalylaminophenylarsinic acid (D.R.-P. 231969),

prepared by heating *p*-aminophenylarsinic acid or its sodium salt with oxalic acid, forms a white crystalline powder, consisting of short, microscopic prisms, which do not melt or decompose below 300°. On nitration, it yields 3-nitro-*p*-oxalylaminophenylarsinic acid, which forms almost colourless, short prisms, and is hydrolysed to 3-nitro-*p*-aminophenylarsinic acid, $\text{NO}_2\cdot\text{C}_6\text{H}_3(\text{NH}_2)\cdot\text{AsO}(\text{OH})_2$. This crystallises as yellow needles, decomposing explosively above 300°; it is reduced by aqueous sodium hyposulphite to 3:4-diaminophenylarsinic acid, $\text{C}_6\text{H}_3(\text{NH}_2)_2\cdot\text{AsO}(\text{OH})_2\cdot\frac{1}{2}\text{H}_2\text{O}$, which forms small, colourless prisms, m. p. 158—159° (decomp.), with previous darkening at 140°.

Aminophenylarsinic acid, $\text{N} \begin{smallmatrix} \diagup \\ \text{NH} \end{smallmatrix} \text{C}_6\text{H}_4\cdot\text{AsO}(\text{OH})_2$, prepared by

the action of nitrous acid on diaminophenylarsinic acid, crystalline, stout, colourless prisms, decomposing explosively above 300°.

The diamino-acid reacts with carbonyl chloride, yielding *o*-phenylene carbamidoarsinic (benzimidazolonearsinic) acid,

which crystallises in prisms or platelets, and with phenanthraquinone in glacial acetic acid solution to form diphenylenequinazolinarsinic

(phenanthraphenazinearsinic) acid, $\begin{array}{c} \text{C}_6\text{H}_3 \cdot \text{C} \cdot \text{N} \\ \diagup \quad \diagdown \\ \text{C}_6\text{H}_3 \cdot \text{C} \cdot \text{N} \end{array} \text{C}_6\text{H}_3 \cdot \text{AsO}(\text{OH})_2$; both substances remain unchanged below 300°.

F. B.

Preparation of Nitrohydroxyarylarinic Acids. FARBENFABRIK VORM. MEISTER, LUCIUS & BACHING (D.R.-P. 235141).—When nitro-1-aminophenyl-4-arsinic acid (this vol., i, 594, 760) is stirred into a solution of potassium hydroxide (36 Bc) and heated at 80°, it yields the corresponding nitrophenol-4-arsinic acid, which is isolated by acidification, whilst by an analogous series of operations *o*-toluidine-4-arsinic acid furnishes nitro-*o*-cresol-4-arsinic acid. F. M. G. M.

Diphenylstibine Compounds. AUGUST MICHAELIS and ARNOLD GÜNTHER (Ber., 1911, 44, 2316—2320).—The substance produced by the reaction of triphenylstibine with antimony trichloride in presence of xylene is not chlorophenylstibine, as stated by Haefelbauer (Abstr., 1899, i, 209), but chlorodiphenylstibine, SbPh_2Cl , and certain of the derivatives obtained from it have been described previously by Michaelis and Reese (Abstr., 1886, 885).

Chlorodiphenylstibine, m. p. 68°, crystallises from ether on addition of light petroleum, decomposes when heated in air, but melts unchanged under water, and irritates the skin when applied to it. Sodium carbonate converts it into *diphenylstibine oxide*, $\text{O}(\text{SbPh}_2)_2$, m. p. 78°, which separates on evaporation of its solutions in alcohol as an oil, which slowly solidifies into colourless needles. Both these substances have faint odours in the cold, but develop strong, unpleasant odours when heated. The oxide is transformed into *diphenylstibine sulphide*, m. p. 69°, by hydrogen sulphide in alcohol; it crystallises from hot alcohol in long, colourless needles.

T. A. II.

Preparation of Nuclear Substituted Mercury Derivatives of Halogenated or Nitrated Phenols, or Halogenated Nitrophenols. FARBENFABRIK VORM. FRIEDR. BAYER & Co. (D.R.-P. 234851).—When halogen or nitro-derivatives of phenols are treated with mercuric oxide or mercuric salts, substitution products possessing both acidic and basic characters are formed; they can be purified by solution in alkali hydroxide and precipitation by carbon dioxide, and are decomposed by concentrated mineral acids into their generators.

p-Chlorophenylmercuric oxide was prepared by boiling *p*-chlorophenol with an aqueous acidified (sulphuric acid) solution of mercuric sulphate, *o*-nitrophenylmercuric oxide, a yellow powder, was prepared in an analogous manner, whilst 4-chloro-2-nitrophenylmercuric oxide, a yellow, crystalline powder, was obtained from mercuric oxide and 4-chloro-2-nitrophenol in boiling acetic acid solution.

F. M. G. M.

INSTRUCTIONS TO ABSTRACTORS,

GIVING THE

NOMENCLATURE AND SYSTEM OF NOTATION

ADOPTED IN THE ABSTRACTS.

THE object of the abstracts of chemical papers published elsewhere as in the Transactions of the Society is to furnish the Fellows with a concise account of the progress of chemical science from month to month. It must be understood that as the abstracts are prepared or the information of the Fellows in general, they cannot possibly be made so full or so detailed as to obviate on the part of those who are engaged on special investigations the necessity of consulting the original memoirs.

1. Titles of papers must be given literally.
2. Before beginning to write the abstract, the whole of the original paper must be read, in order that a judgment may be formed of its importance and of the scale on which the abstract should be made.
3. In the case of papers dealing with subjects not strictly chemical, the abstract should refer only to matters of chemical interest in the original.
4. The abstract should consist mainly of the expression, in the abstractor's own words, of the substance of the paper.
5. The abstract should be made as short as is consistent with a clear and accurate statement of the author's results.
6. A concise statement showing the general trend of the investigation should be given at the commencement of those abstracts where the nature of the original permits of it.
7. If an abstract of a paper on the same subject, either by the author of the paper abstracted, or by some other author, has already appeared, note should, as a rule, be made of this fact.
8. Matter which has appeared once in the *Abstracts* is not to be abstracted again, a reference being given to the volumes in which the abstract may be found.
9. As a rule, details of methods of preparation or analysis, or generally speaking of work, are to be omitted, unless such details are essential to the understanding of the results, or have some independent value. Further, comparatively unimportant compounds, such as the inorganic salts of organic bases or acids, should be mentioned quite shortly. On the other hand, data such as melting and boiling points, sp. gr., specific rotation, &c., must be given in every case unless recorded in earlier papers.

Nomenclature.

10. Employ names such as *sodium chloride*, *potassium sulphate* for inorganic compounds, and use the terminals *ous* and *ic* only in distinguishing compounds of different orders derived from the same elementary radicle; such, for instance, as mercurous and mercuric chlorides, sulphurous and sulphuric acids.

11. Term compounds of metallic radicles with the OH-group *hydroxides* and not hydrates, the name hydrate being reserved for compounds supposed to contain water of combination or crystallization.

12. Term salts containing an amount of metal equivalent to the displaceable hydrogen of the acid, *normal* and not neutral salts, and assign names such as sodium hydrogen sulphate, disodium hydrogen phosphate, &c., to the acid salts. Basic salts as a rule are best designated merely by their formulae.

13. Names in common use for oxides should be employed, for example: NO, nitric oxide; CO₂, carbon dioxide; P₂O₅, phosphoric oxide; As₂O₃, arsenious oxide; Fe₂O₃, ferric oxide.

14. In open chain compounds, Greek letters must be used to indicate the position of a substituent, the letter *a* being assigned to the first carbon atom in the formula, except in the case of CN and CO₂H, for example, CH₃·CH₂·CH₂·CH₂I *a*-iodobutane, CH₃·CH₂·CH₂·CN *a*-cyanopropane.

15. Isomeric open chain compounds are most conveniently represented as substitution derivatives of the longest carbon chain in the formula; for example,

$$\begin{array}{c} \text{CH}_3 \\ | \\ \text{CH}_3 \cdot \text{CH}_2 \end{array} > \text{CH} \cdot \text{CH} < \begin{array}{c} \text{CH}_3 \\ | \\ \text{CH}_3 \end{array} \text{ or } \text{CH}_3 \cdot \text{CH}_2 \cdot \text{CHMe} \cdot \text{CHMe} \cdot \text{CH}_3$$
 should be termed *βγ*-dimethylpentane not *methylethylisopropylmethane*, and
$$\begin{array}{c} \text{CH}_3 \\ | \\ \text{CH}_3 \end{array} > \text{CH} \cdot \text{CH} < \begin{array}{c} \text{CH}_3 \\ | \\ \text{CO}_2\text{H} \end{array} \text{ or } \text{CH}_3 \cdot \text{CHMe} \cdot \text{CHMe} \cdot \text{CO}_2\text{H}$$
 should be termed *αβ*-dimethylbutyric acid, not *αββ*-trimethylpropionic or *α-methylisovaleric*, or *methylisopropylacetic acid*.

16. Use names such as methane, ethane, &c., for the normal paraffine or hydrocarbons of the C_nH_{2n+2} series of the form CH₃·[CH₂]_n·CH₃, &c. Term the hydrocarbons C₂H₄ and C₂H₂ *ethylene* and *acetylene* respectively (not *ethene* and *ethine*). Homologues of the ethylene series are to be indicated by the suffix *-ene*, and those of the acetylene series, wherever possible, by *-yne*. Adopt the name *allene* for the hydrocarbon CH₂:C:CH₂.

17. Distinguish all hydroxyl derivatives of hydrocarbons by names ending in *ol*. Alcohols should be spoken of as mono-, di-, tri-, or *n*-hydric, according to the number of OH-groups. Compounds which are not alcohols, but for which names ending in *ol* have been used, are to be represented by names ending in *ols*, if a systematic name cannot be given, thus anisole not anisol, indole not indol. Compounds such as MeONa, EtONa, &c., should be termed sodium methoxide, sodium ethoxide, &c.

18. The radicles indicated in the name of a compound are to be

comes in the order fluoro-, chloro-, bromo-, iodo-, nitro-, nitroso-, amino-, imino-, cyano-, thiocyno-, hydroxy-, keto-.

19. Compounds analogous to the acids of the lactic series containing the OH-group should be termed *hydroxy-derivatives*, and not *oxy-derivatives*; for example, hydroxyacetic and not oxyacetic acid. Compounds containing the analogous groups OEt, OPh, OAc, &c., should in like manner be termed *ethoxy-, phenoxy-, acetoxy-derivatives*. Thus α -ethoxypropionic acid, $\text{OEt}\cdot\text{CHMe}\cdot\text{CO}_2\text{H}$, instead of ethyl-lactic acid; 3,4-diethoxybenzoic acid, $(\text{OEt})_2\text{C}_6\text{H}_3\cdot\text{CO}_2\text{H}$, instead of diethylprotocatechuic acid; and α -acetoxypropionic acid, $\text{OAc}\cdot\text{CHMe}\cdot\text{CO}_2\text{H}$, instead of acetyl-lactic acid. Terms such as diethylprotocatechuic acid should be understood to mean a compound formed by the displacement of hydrogen atoms in the hydrocarbon radicle of protocatechuic acid by ethyl, thus, $\text{C}_6\text{H}_3(\text{OEt})_2\cdot\text{CO}_2\text{H}$, and not $\text{C}_6\text{H}_5(\text{OEt})_2\cdot\text{CO}_2\text{H}$, just as if the formula $\text{C}_6\text{HBr}_2(\text{OH})\cdot\text{CO}_2\text{H}$.

20. The term *ether* should be restricted to the oxides of hydrocarbon radicles and their derivatives, and the esters (so-called compounds ethers or ethereal salts) should be represented by names similar to those given to metallic salts.

21. When a substituent is one of the groups NH_2 , NHR , NR_2 , NH or NR , its name should end in *ino*; for example, β -aminopropionic acid, $\text{NH}_2\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$, β -anilino-acrylic acid, $\text{NHPh}\cdot\text{CH}=\text{CH}\cdot\text{CO}_2\text{H}$, α -aminopropionic acid, $\text{NH}\cdot\text{CMe}\cdot\text{CO}_2\text{H}$.

22. Compounds of the radicle SO_3H should, whenever possible, be termed *sulphonic acids*, or failing this, *sulpho-compounds*; for example, benzenesulphonic acid, sulphobenzoic acid.

23. Basic substances should invariably be indicated by names ending in *ine*, as aniline instead of anilin, the termination in being restricted to certain neutral compounds, viz., glycerides, glucosides, bitter principles, and proteins, such as palmitin, amygdalin, albumin. The compounds of basic substances with hydrogen chloride, bromide or iodide should always receive names ending in *ide* and not *ate*, as morphine hydrochloride and not morphine hydrochlorate.

24. The Collective Index, 3rd decade (1893-1902) should be adopted as the standard of reference on questions of nomenclature not provided for in the preceding sections.

Notation.

25. In empirical formulae the elements are to be given in the order C, H, O, N, Cl, Br, I, F, S, P, and the remainder alphabetically.

26. Equations should be omitted unless essential to the understanding of the results; as a rule, they should not be written on a separate line, but should "run on" with the text.

27. To economise space, it is desirable:

- (a) That *dots* should be used instead of *dashes* in connecting contiguous symbols or radicles, whenever this does not interfere with the clearness of the formula.

- (b) That formulæ should be shortened by the judicious employment of the symbols Me for CH_3 , Et for C_2H_5 , Pr for $\text{CH}_3\cdot\text{CH}_2\cdot\text{CH}_3$, Prⁿ for $\text{CH}_3(\text{CH}_2)_n$, Ph for C_6H_5 , Py for $\text{C}_5\text{H}_5\text{N}$, Ac for $\text{CO}\cdot\text{CH}_3$, and Bu for $\text{CO}\cdot\text{C}_6\text{H}_5$.

- (c) That formulæ should be written in one line whenever this can be done without obscuring their meaning.

28. In representing the constitution of benzene derivatives, the relative positions of the radicles in the symbol of benzene should be indicated by numerals, instead of by means of the hexagon formula.

- (a) The abbreviations *o*-, *m*-, and *p*-, should be used in place of 1:2- or ortho-, 1:3- or meta-, and 1:4- or para-.
- (b) In numbering positions in the case of substitution derivatives of phenol, aniline, benzonitrile, benzoic acid, benzenesulphonic acid, benzaldehyde, and toluene the characteristic radicle of each of these parent substances is to be regarded as in position 1 (compare Collective Index).
- (c) Names of substitution derivatives should be given in such a way that the position of the substituent is indicated by a numeral prefixed; for example:—

29. In representing the constitution of derivatives of other "closed chain" hydrocarbons, graphic formulæ should not be employed, but the system of numbering positions indicated in Richter's *Lexikon der Kohlenstoff-Verbindungen* (3rd edition, 1910, pp. 14—26) should be used, of which the following schemes may be regarded as typical:—

Purine.*

Pyridine.

Indole.

Naphthalene.

Quinoline.

isoQuinoline.

Anthracene.

Phenanthrene.

Diphenyl.

 $\beta\beta$ Dinaphthyl.**Manuscript.**

30. In view of the difficulty of dealing with MSS. of widely varying size, abstracts cannot be accepted unless written on quarto paper (10 x 8 in.).

31. Not more than one abstract must appear on a sheet.

32. When an abstract exceeds a sheet in length, the sheets must be fastened together by means of gum at the top left-hand corner.

33. The name of the abstractor must be written diagonally at the top left-hand corner of the first sheet of the abstract.

Proofs.

34. Abstractors are expected to read and correct proofs carefully, and to check all formulæ and figures against MSS.

35. All proofs, however small, must be returned to the Sub-Editor not later than 24 hours after receipt from the printers.

*. The Editor's decision, in all matters connected with the abstracts, must be considered final.

* This numbering, proposed originally by E. Fischer, is adopted in the text of the *criteria*.

JOURNALS FROM WHICH ABSTRACTS ARE MADE

General and Physical Chemistry.

The Density and Refraction of the System Furfuraldehyde + Water. F. SCHWERS (*Bull. Acad. roy. Belg.*, 1911, 641—653).—The densities and refractive indices of binary mixtures containing 4.6, 5.1, 6.5, and 96.3% of furfuraldehyde have been measured at different temperatures.

Curves are plotted to show the volume contraction which occurs in the formation of the various solutions in its dependence on the temperature. These curves exhibit certain irregularities, which in the case of the dilute furfuraldehyde solutions are similar to those which have been observed previously in the case of mixtures of water with dimethyl glycol and ethyl acetoacetate.

In regard to the refractive index, the observed values differ from those calculated by an amount which is more or less independent of the composition and the temperature of the binary mixture. Observations with the hydrogen lines H_α and H_β and the yellow helium line show that the difference depends on the wave-length of the light used.
H. M. D.

Refractive Indices of Liquid Crystals. PAUL GAUBERT (*Compt. rend.*, 1911, 153, 573—576. Compare Abstr., 1909, ii, 529; Wallerant, *ibid.*).—The author records observations on the refractive indices of the isotropic forms of cholesterol, cholesteryl benzoate, arate, decate, and propionate; also of mixtures of the latter with the decate and with *p*-azoxyphenetole. Measurements could not be made in the case of some of the mixtures, owing to solidification of the superfused liquid taking place without production of the optically positive anisotropic phase.

The difference between the refractive index of the isotropic liquid and the liquid crystal is small. Crystals of the doubly refractive liquid phase, produced before solidification, are optically positive, whilst those belonging to the anisotropic liquid phase existing at a higher temperature are negative. The experiments on mixtures showed that their optical properties do not follow the laws relating to the mixture of isomorphous solid crystals, apparently owing to the occurrence of one substance in a polymorphous, crystalline liquid form, unknown in the pure substance.
W. O. W.

The Secondary Spectrum of Hydrogen. C. PORLEZZA (*Atti R. Acad. Lincei*, 1911, [v], 20, ii, 176—183).—The measurements of the secondary spectrum of hydrogen have now been extended to the yellow and red regions, as far as λ 6963, and to the ultra-violet as far as λ 3295. New lines are found in both regions, as well as in the region λ 4807—4253. The wave-lengths are tabulated. Certain lines observed by Croze (this vol., ii, 558) are not found, and the differences are possibly due to the difference in diameter of the capillaries used by the two observers, otherwise the lines found only by Croze must

be due to the presence of an impurity (compare Watson, *Abstr.* 1907, ii, 453). C. H. B.

The Ratio of the Intensities of the Series Lines of Hydrogen in the Canal Ray Spectrum. FRITZ LÜNKEMANN (*Ann. Phys.*, 1911, [iv], 36, 134—153).—The relative intensities of the lines H_α and H_β in the hydrogen canal ray spectrum have been measured for different velocities of the luminous particles. For this purpose the intensities of the two lines were compared with that of light of the same wave-length emitted by a Nernst lamp, and also by a Geissler discharge tube, which were operated under constant conditions. In some experiments, the comparison was effected subjectively, and in others by means of photographic records. Within the limits of the errors of experiment, the results obtained show that the ratio of the intensities of the two hydrogen lines is independent of the velocities of the canal ray particles. This is opposed to the results obtained by Stark and Steubing (*Abstr.*, 1908, ii, 546), who found that an increase in the velocity of the particles is accompanied by an increase in the relative intensity of the lines of smaller wave-length. It is probable that the relative intensities are dependent on the gas pressure in the discharge tube, and this may account for the divergent results obtained by Stark and Steubing. H. M. D.

The Resonance Spectra of Iodine Vapour and their Destruction by Gases of the Helium Group. ROBERT W. WOOD (*Phil. Mag.*, 1911, [vi], 22, 469—481. Compare this vol., ii, 169, 170).—A method is described by which the resonance spectra of iodine can be exhibited to an audience by means of a Cooper-Hewitt lamp and a small pocket spectroscope. With the improved illumination of the vapour which can be obtained by means of suitably arranged quartz-mercury arc lamps and a cylindrical vapour tube, new photographs of the resonance spectra excited by the green and the two yellow mercury lines have been obtained. The spectrum excited by the green line consists of a series of equidistant lines, eighteen members of which are shown in the photographic records. The two yellow lines give rise to a series of fifteen equidistant doublets, two of which are situated below and twelve above the exciting lines. The series excited by $\lambda = 5790.5$ is much more intense than the series due to $\lambda = 5769.5$; this is probably due to a closer coincidence between the wave-length of the less refrangible yellow line of mercury and one of the absorption lines of the iodine vapour. The wave-lengths of the various lines are considered to be correct to about one Angstrom unit. From a comparison of the wave-length differences in each series, it is found that these increase as the red end of the spectrum is approached.

As the result of a comparison of the effects produced by the various inert gases in transforming the resonance spectrum into the banded spectrum, which is excited by white light, it is found that helium is the most active. In presence of krypton at 1.7 mm. pressure, the band spectrum could only just be distinguished, and with xenon at 1.5 mm pressure, no trace of the band spectrum was found, although the

intensity of the resonance emission was reduced to about one-fourth of its original value.

Further observations in which the vapour was excited by polarised light show that the resonance lines are themselves polarised, and from this it may be inferred that the directed motion passed over by the light waves to the resonant electron is passed on as directed motion to the other electrons. When in presence of helium the resonance spectrum is completely replaced by the band spectrum; the emitted light is still found to be partially polarised. H. M. D.

The Colorimetric Dilution Law. ARTHUR HANTZSCH (*Annalen*, 1911, 384, 135—142. Compare Piccard, this vol., ii, 561).—Piccard's views are at variance with the results of the author's experiments on chromoisomerides, which show that Beer's law is untenable even for isomerides. The law holds for the structurally unchangeable ethyl diethylacetacetate and ethyl ethoxycrotonate in all solvents, but in the case of ethyl acetoacetate in hexane the equilibrium is shifted with increasing dilution in the direction of the more strongly absorptive enol form, a result which is confirmed in a purely chemical way by titration with bromine (Meyer, this vol., i, 350, 832, 833).

The author also shows that Beer's law is inapplicable to solutions of the colourless and the yellow modifications of ethyl dichlorodihydroxyterephthalate and of the colourless and the yellow forms of *o*-nitroaceto-*p*-toluidide (all of which are unimolecular in solution), and also to the chromoisomeric pyridine, quinoline, and acridino salts (this vol., i, 673).

Contrary, therefore, to Piccard's views, the author is of opinion that the untenability of Beer's law denotes the existence of chromoisomerides in equilibrium in the solution, provided that polymerides have previously been shown to be absent. C. S.

The Colour of Iodine Solutions. HEINRICH LEY and K. VON ENGELHARDT (*Zeitsch. anorg. Chem.*, 1911, 72, 55—62).—A re-examination of the absorption spectrum of freshly prepared solutions of iodine in ethyl alcohol confirms the results formerly obtained (Abstr., 1910, ii, 813) with a single band at $1/\lambda$ 2150. The different results obtained by Waentig (Abstr., 1910, ii, 117) and Crymble, Stewart, and Wright (*ibid.*, 470), showing two absorption bands, are due to the use of old solutions. The gradual decomposition may be followed spectroscopically.

The violet solutions of iodine in hexane or chloroform have identical spectra, with a band at $1/\lambda$ 2000 and another in the ultra-violet. Beer's law is not followed, especially in the ultra-violet region. The ethereal solution is intermediate in character, and the differences between the spectra are less than those found by Waentig. The absorption coefficients of a solution of iodine in benzene show that in this case, also, the head of the band lies at $1/\lambda$ 2000. It is held that the brown solutions contain additive compounds, I_2L_m , but the constitution of the violet solutions is still uncertain. C. H. D.

Absorption Spectra of Triphenylmethyl and of Salts of Triphenylcarbinol. KURT H. MEYER and HEINRICH WILAND (*Ber.*, 1911, 44, 2557—2559).—Non-conducting solutions of triphenylmethyl (and also of other triarylmethyls) in organic solvents are sharply distinguished from the triphenylmethyl ion, assumed to be present in solutions of salts of triphenylcarbinol, by means of the spectroscope. Whilst the latter exhibit continuous absorption in the more refrangible region of the (visible) spectrum, solutions of triphenylmethyl are characterised by a banded spectrum consisting of one strong, sharply defined band and a second, which is weaker.

The conducting solution of triphenylmethyl in liquid sulphur dioxide exhibits the continuous absorption of the triphenylmethyl ion (probably, therefore, a salt-like additive compound of solute and solvent is formed), but after removing the sulphur dioxide by a current of carbon dioxide and dissolving the residue in benzene, the yellow solution shows the banded spectrum of triphenylmethyl. These results are claimed to be in harmony with Baeyer's theory (*Abstr.*, 1905, i, 281).

C. S.

Crystalline Liquids. H. VON WARTENBERG (*Physikal. Zeitsch.*, 1911, 12, 837—839. Compare Bose, 1909, ii, 383; this vol., ii, 124).—The optical behaviour of the crystalline liquid forms of *p*-oxyanisole and *p*-oxyphenetole has been examined when the turbid liquids are subjected to the influence of a magnetic field. Observations were made with parallel and convergent polarised rays of light and in directions parallel and at right angles to the lines of force. Both substances were found to behave like uniaxial crystals, and thus the crucial test suggested by Nernst (*Zeitsch. Elektrochem.*, 1910, 16, 702) is in favour of Bose's theory of the liquid crystalline state of aggregation. The magnetic field has no influence on the clearing temperature in either of the substances investigated.

H. M. D.

Development of Colours on Fibres by Light Energy. OSKAR BAUDISCH (*Chem. Zeit.*, 1911, 35, 1141—1142).—Silk and wool may be dyed a brilliant cherry-red, which is quite fast, by treating the fabric with an aqueous ammoniacal solution of the ammonium salt of α -nitrosodiphenylhydroxylamine, steaming, drying, and finally exposing to the action of light.

During the steaming process, the α -nitrosodiphenylhydroxylamine, which is fixed on the fibres, decomposes with the formation of α -nitrosodiphenylene; the latter substance, probably aided by the reducing action of the animal fibre, then changes into α -azodiphenylene, which under the influence of light becomes red, in all probability owing to its transformation into the corresponding hydroxyazodiphenylene.

It is not improbable that other nitrosoarylhydroxylamines will be found to behave in a similar manner.

α -Nitrosodiphenylhydroxylamine is a white, crystalline substance, which is very sensitive to the action of light; the ammonium salt crystallises in white leaflets, and is most readily obtained by the

action of amyl nitrite on a cold solution of α -nitronaphthylhydroxylamine containing an excess of ammonia; the copper salt, $(C_{10}H_7O_2N_3)_2Cu$, crystallises from chloroform in glistening, greyish-blue needles; the copper salt is very soluble in ether, forming an intense red solution.

W. H. G.

The Ranges of α -Particles from Various Radioactive Substances and a Relation between the Range and Period of Transformation. HANS GEIGER and J. M. NUTTALL (*Phil. Mag.*, 1911, [vi], 22, 613—621).—A film of the active substance was placed centrally in a silvered globe of 8 cm. radius, and the ionisation current in air determined at various pressures. This is independent of the pressure until the range of the α -particle becomes equal to the radius of the globe. At this point the ionisation current begins to diminish as the pressure is further reduced. From the point of inflexion on the curve the range is found, and from this the initial velocity of the α -particle can be calculated. The results obtained are given in the table:

Substance.	Range at 15°.	Range at 0°.	Initial velocity.
Uranium	2.72 cm.	2.58	1.51×10^9 cm./sec.
Ionium	3.00 ..	2.84	1.56 ..
Radium	3.30 ..	3.13	1.61 ..
Polonium	3.77 ..	3.58	1.68 ..
Thorium	2.72 ..	2.58	1.51 ..
Radio-thorium ...	3.87 ..	3.67	1.70 ..

If the logarithm of the range is plotted against the logarithm of the period of transformation, the points for the uranium-radium series fall approximately on a straight line, whilst those for the actinium series fall on another straight line of similar slope, parallel to the first. The thorium series is still being investigated. The results in the other two series include in each case five α -ray-giving products. The period of ionium calculated from the range of its α -particles is nearly one million years. That of radium-C' similarly calculated should be about a millionth of a second. The range is proportional to the cube of the velocity, so that similar straight lines would result on plotting the logarithm of the periods and of the velocity of the α -particles. On this rule, which at present is empirical, an explanation suggests itself why no α -rays of low range are known, for the period of transformation would be so great that the activity would be beyond the limit of detection.

F. S.

Production of Helium by Radium. BERTRAM B. BOLTWOOD and ERNEST RUTHERFORD (*Phil. Mag.*, 1911, [vi], 22, 586—604).—A quantity of radium chloride, freed from radio-lead and polonium by treatment with hydrogen sulphide after addition of bismuth, lead, and antimony, was sealed up in a Jena glass combustion tube and the air exhausted. By γ -ray measurements the quantity of radium was found to be 0.191 gram. Re-measured at the close of the experiments the quantity found was 0.193 gram. In the first experiment the time of accumulation was eighty-three days, and the volume of helium

evolved on heating the tube was 6.58 cu. mm. at *N.T.P.* In the second experiment the time of accumulation was 132 days, and, after the withdrawal of the gases, the radium chloride was dissolved in dilute hydrochloric acid and the helium collected. The total helium was 10.38 cu. mm. The two results agree in giving the rate of production of helium per gram of radium, in equilibrium with its first three α -ray-giving products, as 186 cu. mm. per year. The theoretical rate, calculated from the number of α -particles expelled, is 158 cu. mm. The radium standard employed was 97.22% pure in terms of that used in the atomic weight determinations by Thorpe. The production of helium from a known amount of radium emanation was found to be in fair agreement with that calculated. The production of helium was also observed from preparations containing polonium.

F. S.

The Relative Number of Ions Produced by the β -Particles from the Various Radioactive Substances. HANS GEIGER and ALOIS F. KOVARIK (*Phil. Mag.*, 1911, [vi], 22, 604-613).—E; assuming that the ionisation produced by a β -particle does not depend appreciably on the velocity, and examining cases where the β -ray-giving product is in equilibrium with an α -ray-giving product, the relative number of ions produced per atom disintegrating by the β -rays can be determined; for the number of α -particles can be counted, and this is identical with the number of atoms breaking up giving β -rays. The ionisation due to β -rays divided by this number gives the β -ray ionisation per atom disintegrating. The number of α -particles was determined by an ionisation method at low pressure from data previously accumulated (Abstr., 1909, ii, 473), and checked by scintillation experiments. The number of ions produced per cm. of path per atom disintegrating was found to be similar in the case of the β -ray products thorium-D and the corresponding actinium product, and about twice as great as in the cases of radium-B and uranium-F, whilst radium-C was intermediate. In the first case the number found was 136, in the second 69 and 78, and in the third 108. The most probable explanation is that different numbers of β -particles are expelled per atom disintegrating in the different cases. If it is assumed that two β -particles are given per atom of thorium-D, the number of ions produced per cm. in air by a high velocity β -particle is 67. This is higher than Durack's value, in which, however, the reflexion of the β -particles by the walls of the ionisation chamber was not corrected for.

F. S.

The Emission of Electrons in Chemical Reactions. FRITZ HABER and GERHARD JUST (*Ann. Physik*, 1911, [iv], 303-347). Compare Abstr., 1909, ii, 853; this vol., ii, 572).—An improved method is described for the investigation of the electron emission which takes place when electro-positive metals react with certain gases. With this apparatus experiments have been made in which a potassium alloy was allowed to react with the vapour of carbonyl chloride. At very low pressure, the surface of the reacting alloy being continuously renewed by the formation of a rapid succession of drops at

the extremity of a silver capillary terminating in the neighbourhood of a silver plate connected with the electric discharge measuring apparatus.

The results of these experiments confirm previous conclusions, and show that the reaction at the ordinary temperature and in the absence of light is accompanied by the emission of electrons, resulting in the charging of the alloy to a potential of about one volt. That the carriers of the electric discharge are free electrons is proved by the behaviour towards a magnetic field.

When the carbonyl chloride is replaced by bromine, free electrons are also emitted, but if the sodium-potassium alloy is replaced by cesium, potassium, or lithium-amalgam, negative ions are produced. In all cases the effect is of unipolar character, and is observed in the entire absence of light.

H. M. D.

Transformation and Nomenclature of the Radioactive Emanations. ERNEST RUTHERFORD and HANS GEIGER (*Phil. Mag.*, 1911, [vi], 22, 621-629).—The new short-lived products of transformation of the thorium and actinium emanations give α -rays, and have half-value periods respectively of 0.14 sec. and 0.002 sec. (compare next abstract). In each case they carry positive charges when produced, and are carried in an electric field to the negative electrode, constituting, therefore, the first members of the active deposits analogous to radium-A (compare Geiger, this vol., ii, 683). They may be put into evidence in the dark by immersing a rod coated with zinc sulphide into the emanations. On charging it negatively, the end instantly lights up, and as suddenly dies out when the rod is discharged. The actinium product of period 0.002 sec. was observed by Giesel eight years ago (*Abstr.*, 1903, ii, 193) in this phenomenon, which he termed the "E-rays." The thorium product can be put into evidence by driving an endless wire, by a motor, through small holes in white corks closing a cylinder containing a source of thorium emanation, and charging the wire negatively. The wire, as it leaves the cylinder, is active when the motor is working, and its activity and the decay along the wire can be examined by a zinc sulphide screen. It is proposed to call the new products thorium-A and actinium-A, in accordance with the nomenclature in the radium series, where radium-A, the first short-lived α -ray-giving product of the emanation, has been known from the start. Hence the next rayless products, previously termed thorium-B and actinium-B, will now be designated thorium-B and actinium-B, and are thus made analogous to the rayless product radium-B. The next two α -ray-giving products of thorium are termed thorium-C₁ and -C₂, analogously to radium-C₁ and -C₂, the β -ray succeeding product is termed thorium-D as at present, the corresponding actinium products being also termed actinium-C and actinium-D. The group radium-C₁ and -C₂ corresponds with the C and D members of their series, in that radium-C₂, and possibly radium-C₁, also gives β and γ -rays. On the new nomenclature, the A substances are short-lived, and give α -rays; the B substances are the longest lived of the active deposit products, and give only feeble non-penetrating β -rays. The C substances all give α -rays, and in the case of radium,

β and γ -rays also, the D substances of thorium and actinium giving the β - and γ -rays.

Radioactive Products of Short Life. H. G. J. MOOREY and KASIMIR FAJANS (*Phil. Mag.*, 1911, [vi], 22, 629—638).—A source of actinium or thorium emanation was contained in an ebonite box, open at one end, the edges of which, covered with velvet pressed against a disk capable of rotation at a high speed. Inside the box was a metal gauze which could be positively charged with respect to the disk, causing the short-lived products actinium- A and thorium- A (compare preceding abstract) to be deposited on the rotating disk. Two sector-shaped ionisation chambers, the faces of which opposite the disk were covered with gold-beater's skin and aluminium leaf, were arranged in definite positions on the periphery of the disk, and the ionisation in them compared with the disk revolving at known speed. From the decay of activity over the period required for the disk to turn from opposite the first to opposite the second ionisation chamber the periods of the products were determined. The half-period of actinium- A was found to be 0.002 second, λ being 347 (sec.⁻¹), and that of thorium- A 0.145 second. With similar apparatus an examination was made of the active deposit of actinium to test the question whether the α -ray-producing member actinium- C was complex (compare Abstr., 1910, ii, 768). No evidence of any short-lived product was found, the formation of the β - and γ -ray products actinium- D appearing to follow the disintegration of actinium- C directly.

The Number of Ions Produced by the β - and γ -Rays from Radium- C . A. S. EVE (*Phil. Mag.*, 1911, [vi], 22, 551—562).—In the use of very lightly built electroscopes of known capacity, constructed out of light metal rods covered with thin aluminium foil, the number of ions produced by the β - and γ -rays respectively of known quantities of radium at known distances from the electroscope has been determined. For the γ -rays, the radium preparation was surrounded with thin cylinders of zinc or lead, and placed between the poles of an electromagnet to deflect the β -rays. The β -rays were used from various sources, the most satisfactory being from a thin leaf of aluminium coated with the active deposit. The total number of ions produced per second by the γ -rays from a curie of radium- C (the radium- C , in equilibrium with 1 gram of radium) is 1.1×10^{12} , the number produced per c.c. per second at a distance of 1 cm. from the radium- C , in air at atmospheric pressure, is 3.74×10^9 . Corresponding values for the β -rays are 4×10^{14} and 1.3×10^{11} , but these could only be approximately evaluated. The average number of ions made by the flight of one β -particle of radium- C is 1.2×10^4 , or about 4 ions per cm. of path, assuming that one curie produces 3.4×10^{11} β -particles per second. It is estimated that only one out of every 180 molecules traversed by the β -particle is ionised. If the γ -ray is considered as an entity, one being expelled per atom of radium- C disintegrating, it produces 3×10^4 ions on the average, or 1.2 ions per cm. of path. Calculating from the ionisations as a measure of the

energy, the heating effects of radium, 110 calories per gram per hour, are due, 103.5 calories to α -rays, 2.0 to β -rays, and 4.5 to γ -rays.
F. S.

The Concentration and Isolation of Radioactive Substances by "Fractional Adsorption." EUGEN EBLER and M. FELLNER (*Ber.*, 1911, 44, 2332—2338*).—The method employed is to shake the solution for some hours with metasilicic acid gel, prepared by the hydrolysis of dilute vapour of silicon tetrachloride and subsequent dialysis; this vol., ii, 723), and then to volatilise the silicic acid by means of hydrofluoric acid. With dilute solutions of radium barium chloride, from 90 to 100% of the radium was so adsorbed and concentrated in a preparation from one-fourth to one-fiftieth of the initial weight in different experiments. With radio-lead 86 to 95% was adsorbed, and the concentration of weight was from one-third to one hundredth, but the separate activities of the constituents, radium-*D*, *E* and *F*, are not stated. The radium *F* was adsorbed more than the radium-*D*. With uranium-*X*, the greater part of the active matter was adsorbed. Many advantages are claimed for the method. The small quantities of the materials adsorbed are of no disadvantage. Greater concentration of the material by a single operation is possible than by any other process, and no intermediate products result as in ordinary fractional crystallisation.
F. S.

Valency in Gaseous Ionisation. J. FRANCK and W. WESTPHAL (*Phil. Mag.*, 1911, [vi], 22, 547—551).—The conclusion of Millikan and Fletcher (this vol., ii, 573) that ionisation of gases by radium or Röntgen rays is never accompanied by the liberation of more than one electron from a gas molecule, is considered to be irreconcilable with certain observations. Although the conditions necessary for the production of multivalent ions have not yet been established, there can be little doubt that such ions are formed in certain circumstances.
H. M. D.

The Carriers of Electricity in Gases. A. BECKER (*Ann. Physik*, 1911, [iv], 36, 209—280).—The author has investigated the nature of the carriers of the electric charge in gases ionised by Röntgen rays, ultra-violet light, and cathode rays.

Under the influence of Röntgen rays, dust-free gases give rise solely to rapidly moving carriers, and the presence of water or other vapours appears to have no influence on the mobility of the carriers. This behaviour differs from that found in the ionisation of gases by ultra-violet light, the much larger, slowly moving carriers which are formed in this case being probably due to chemical changes brought about by the ultra-violet rays. The condensation nuclei which give rise to the large carriers do not appear to be the immediate consequence of this action, for evidence has been obtained in favour of the view that these nuclei result from the action of the product of the chemical change on traces of foreign vapours present in the gas.

In the case of gases which contain oxygen, the primary product is probably ozone, and this, by interaction with substances like sulphur

* and *Zeitsch. anorg. Chem.*, 1911, 73, 1—30.

dioxide, ammonia, and hydrogen sulphide, gives rise to solid or liquid particles. The activity of ozone in the formation of slowly moving carriers has been examined in detail, and found to depend on the concentration both of the ozone and of the vapour with which the ozone reacts.

Cathode rays give rise to a much smaller number of the slowly moving carriers, and it is supposed that these are not really due to the cathode rays, but to the action of the ultra-violet light which accompanies the cathode ray radiation.

In reference to the rapidly moving carriers, experiments are described which show that these are of larger dimensions than the gas molecules. Whatever the nature of the condensation process which is involved in the production of these carriers, it appears that the process takes place very rapidly, and may be considered complete after the lapse of a few tenths of a second. In this respect the condensation process differs from that resulting in the formation of the slowly moving carriers.

H. M. D.

Ionisation of Gases by Canal Rays. R. SEELIGER (*Physikal. Zeitsch.*, 1911, 12, 839—842).—Canal rays from a discharge tube were made to pass between the plates of a condenser arranged so as to measure the ionisation produced, and the rays were then collected by means of a cylindrical receiver which enabled the number of positively charged particles to be determined.

In hydrogen, at a pressure of 0.01 mm., the relationship between the saturation ionisation current and the positive charge acquired by the receiver indicates that n particles give rise to $n/3$ ions per cm. In oxygen the number of ions produced is about four times as large. For small variations of pressure the number of ions generated is proportional to the gas pressure, but is independent of the velocity of the canal rays as measured by the magnitude of the discharge potential.

H. M. D.

Radioactive Ions. J. FRANCK and LISE MEITNER (*Ber. Deutsch. physikal. Ges.*, 1911, 13, 671—675).—To test Wellisch's hypothesis, that ions in a mixture of gases retain their charge for only a short time and can pass it on from one kind of molecule to another, the mobility found experimentally being a mean of the mobilities of different charged molecules, experiments have been made with the positively charged recoil atoms of thorium-D expelled from the active deposit of thorium. Two brass tubes connected to the poles of a battery were fitted concentrically into a glass tube. The opposed ends of the brass tubes were covered with wire gauze; the one of which connected to the negative pole was made active in the thorium emanation before the experiment. A current of air or hydrogen was maintained through the tubes from the positive inactive to the negative active gauze, the recoiled atoms of thorium-D thus having to travel with the field against this gas stream. The mobility of the recoiled atoms could thus be deduced from the velocity of gas stream necessary to prevent the atoms reaching the negative gauze. The mobility in air was between 0.7 and 1.6 cm./sec. for unit P.G., and in

hydrogen greater than 5 cm./sec. These values are, within the error of experiment, the same as apply for other ions in these gases. This result is opposed to Wellisch's hypothesis, for the method would remove from the gas the recoiled atoms when they lost their charge, with the result that much smaller mobilities would be shown by these gas than has been found. F. S.

The Spontaneous Charging of Polonium. NORMAN CAMPBELL *Physikal. Zeitsch.*, 1911, 12, 870—871).—Hauser's views (this vol., ii, 685) relating to the part played by δ -rays in the spontaneous charging of a polonium plate are criticised. The assumption that the number of rays which leave the active plate when at a potential of e is equal to the number which have a kinetic energy greater than e is unjustifiable. The data obtained in the investigation of the penetrating power of the rays permit also of an alternative explanation. According to this the primary δ -rays are completely absorbed by extremely thin layers, and the changes which are observed on increasing the thickness of these layers are due to the absorption of γ -rays and the production of secondary δ -rays. If. M. D.

Application of the Content of Uranium and Lead of Some Minerals to the Determination of the Ages of the Rocks containing Them. FERRUCCIO ZAMBONINI (*Atti R. Accad. Lincei*, [vi], [v], 20, ii, 131—138).—The author criticises the work of Strutt (Abstr., 1910, ii, 1023) and of Holmes (this vol., ii, 570) on the determination of the age of rocks by means of the ratio between the amounts of lead and uranium contained in them. The mean values deduced by Holmes for rocks of the Christiania district of Norway do not have little significance, because the differences between the values calculated for different rocks (admittedly of the same formation) are very great: in fact, the calculated age of that deposit varies from 336 to 558 million years. The author has collected analytical data, due to Blomstrand and others, for a number of other minerals of the same formation, and from them deduces ages varying from 41 million years to 17,302 million years. Notably discordant results (935 to 1533 million years) are also obtained when different specimens of the same mineral (uraninite) from the formation in question are considered. The Norwegian formation is not exceptional, for similar irregularities are observed in the results from the deposits of gadolinite in Texas (mentioned by Boltwood) and for thorianite from Ceylon. Among the reasons for the inapplicability of this method for estimating geological time, the following are adduced: (1) Strutt's formula, if it is to lead to exact results, demands more precise determination of the ratio Pb/U than is possible at present; (2) most of the minerals hitherto examined have suffered far-reaching change since they first came into existence; (3) the method requires that the lead contained in the mineral shall have originated solely from the uranium; in that case the ratio Pb/U for minerals of the same formation should be constant, whereas Holmes found (in the case of the Christiania formation) that the ratio usually increases as the percentage of uranium diminishes. R. V. S.

The Intensity of the Earth's Penetrating Radiation at Different Altitudes and a Secondary Radiation Excited by it. J. C. McLENNAN and E. N. MACALLUM (*Phil. Mag.*, 1911, [v], 2, 639—646).—The intensity of the earth's penetrating radiation was compared, in a hermetically sealed zinc vessel of 30 litres capacity of 0.5 mm. wall-thickness, at different heights. On the ground at Toronto, 5.8 more ions per c.c. per second were produced than on the ice on Toronto Bay, and this was assumed to be the measure of the penetrating radiation. On a clock tower of the City Hall, 64 metres high, the difference was 2.8 ions per c.c. per second, so that at this height the rays are diminished to 48 per cent. This is in agreement with Eve's calculation (this vol., ii, 89). A secondary radiation due to the earth's penetrating radiation was observed from a high brick wall encircling the university lawn. It extended a distance of 14 or 15 metres, and thus corresponds with β -rays. This produces about 1.5 ions per c.c. per second.

F. S.

Radioactivity of Certain Russian Mineral Springs. P. G. MEZERNITZKY (*J. Russ. Phys. Chem. Soc.*, 1911, 43, *Phys. Part*, 244—255).—The author has examined electrometrically a number of mineral waters from various parts of Russia, all of which exhibit radioactivity, some of them to a greater degree than the waters of Carlsbad, Marienbad, Nauheim, Gastein, etc.

T. H. P.

Conductivities, Temperature-coefficients of Conductivity, and Dissociation of Certain Electrolytes. H. H. ROSFORD and HARRY C. JONES (*Amer. Chem. J.*, 1911, 43, 240—278. *Comp. Abstr.*, 1910, ii, 256).—The electrical conductivity of aqueous solutions of some fifteen inorganic salts has been measured at temperatures between 0° and 65° and at dilutions ranging from 2 to 4096 litres per mol. The salts examined include a number of alums and other double salts.

In agreement with previous results, it is found that the temperature-coefficients are generally much greater for the salts which form hydrated salts at the ordinary temperature than for those which separate out in the anhydrous form. In addition to the dehydration of hydrates, decrease in polymerisation is a probable cause of abnormally rapid increase in conductivity with rise of temperature, and there is evidence that sulphates are polymerised in concentrated solutions.

The data for solutions of the violet and green varieties of potassium and ammonium chromium sulphates show that the change from the violet to the green modification is accompanied by an increase in conductivity, the magnitude of which becomes smaller as the solutions become more dilute, and may become negative. This is attributed to the greater resistance of the green modification to the hydrolytic action of the solvent. Previous measurements at 25° have shown that the conductivities of double salts are less than the sum of the conductivities of the constituent salts. The same relationship holds at all temperatures from 0° to 65°, and the conductivity data show further that the dissociation of such double salts is but slightly affected by change of temperature.

H. M. P.

Conductivity, Temperature-coefficients of Conductivity, and Dissociation of Certain Electrolytes in Aqueous Solution from 0° to 35°. Probable Inductive Action in Solution and Evidence for the Complexity of the Ion. L. G. WINSTON and LARRY C. JONES (*Amer. Chem. J.*, 1911, 46, 368—413).—In continuation of earlier work (Jones and Hosford, preceding and earlier Abstracts), determinations have been made, at temperatures from 0° to 35° and at various dilutions, of the electrical conductivity and dissociation of the following thirty salts: ammonium nitrate and sulphate, ammonium hydrogen sulphate, sodium sulphate, borax, potassium permanganate and permanganate, dipotassium hydrogen phosphate, strontium acetate, magnesium bromide, nitrate, formate and acetate, cadmium chloride, bromide and iodide, lead chloride, aluminium chloride, nitrate and sulphate, chromium chloride and sulphate, manganous sulphate, silver nitrate, cobalt bromide, copper sulphate, uranyl chloride, nitrate, sulphate and acetate.

In general, the results obtained confirm those of the earlier experiments. It has been found that, in all cases, the conductivity increases with rise of temperature and with dilution. The temperature-coefficients, expressed in conductivity units, increase with rise of temperature, except in the case of ammonium hydrogen sulphate and uranyl sulphate, whilst when expressed as percentages they decrease in all cases. The more highly hydrated salts have large temperature-coefficients, and, from a consideration of these constants, the amount of hydration seems to be closely related to the water of crystallisation.

At certain dilutions, cadmium iodide, chromium chloride, uranyl acetate, and silver nitrate show an increase in percentage dissociation with the temperature rises. Cadmium iodide and lead chloride, which have no water of crystallisation, have temperature-coefficients as large as those of highly hydrated salts, such as copper sulphate. These instances appear to be exceptions to the results obtained previously, and indicate that there must be some other factor operating which produces the same effect as hydration. It is considered probable that, in such cases, inductive action takes place through the solvent between charged ions and neutral molecules, and that this gives rise to the formation of complex molecules and ions in solution. E. G.

The Dielectric Constant of Certain Liquids at High Pressures. RUDOLF ORTVAY (*Ann. Physik*, 1911, [iv], 36, 1—24).—The influence of pressure on the dielectric constant of ethyl ether, benzene, toluene, xylene, carbon disulphide, chloroform, paraffin, light petroleum, and castor oil has been measured for pressures up to 500 atmospheres. Nernst's method, in the differential form described by Philip, was employed in the measurements. In all cases, the dielectric constant increases with the pressure in such a way that it can be accurately represented by an equation of the form $D_p = D_1(1 + \alpha p + \beta p^2)$, in which α is positive and β negative. $\alpha \cdot 10^4$ varies from 2.187 for ethyl ether to 0.538 for paraffin, and $\beta \cdot 10^7$ from 0.714 for ethyl ether to 0.324 for paraffin.

In the case of benzene, toluene, and xylene, the variation of the dielectric constant with the pressure is nearly the same.

The value of $(D-1)v/(D+2)$, in which v represents the volume of the liquid, was found to diminish to the extent of 1.3% for ethyl ether and of 1.17% for benzene, when the pressure is raised from 1 to 500 atmospheres. H. M. L.

Chemico-physical Investigations on Animal Liquids. IV. Technique of the Electrometric Method for the Study of the Reaction of the Liquids of the Organism. G. QUAGLIARINI (*Atti R. Accad. Lincei*, 1911, [v], 20, ii, 107—111. Compare Abstr., 1908, ii, 869).—In the practical application of the electrometric method to the study of the reaction of organic liquids, an important difficulty is due to the diffusion potential which is set up between the liquid under examination and the standard liquid. The author has compared the results obtained by the two methods of overcoming this difficulty in use, namely, (1) the addition of an excess of a neutral electrolyte to both solutions; (2) the insertion of a concentrated solution of potassium chloride between the two liquids (compare Bjerrum, Abstr., 1905, ii, 793). His concentration cells were as follows: respectively: $H | serum | KCl(1.75 \text{ or } 3.5N) | HCl(0.01N)$ and $H | serum | NaCl(0.125N) | HCl(0.01N) + NaCl(0.125N) | H$. The results show a small difference of electromotive force amounting to about 0.0025 volt, that of the former cell being the greater. Reasons are adduced in favour of the second method being the more correct. R. V. S.

Normal Elements. P. J. H. VAN GINNEKEN and HUGO R. KERN (*Zeitsch. physikal. Chem.*, 1911, 77, 744—760).—A theoretical paper. In the first section the requirements of a satisfactory normal element are considered. The second section is mainly an extension of the views of Reinders (compare Abstr., 1902, ii, 639) on the application of the phase rule to a normal element, regarded as a system not in equilibrium. The general condition for a normal element is that it must be composed of two parts, both of which are in themselves invariant systems (as regards temperature and pressure) of the same components. G. S.

Transport Numbers and Molecular Complexity. ARMANDO MAZZUCHELLI (*Atti R. Accad. Lincei*, 1911, [v], 20, ii, 124—127).—The author has worked out equations, based on Einstein's formula (compare Lorenz, Abstr., 1910, ii, 577), connecting transport numbers and molecular complexity, and proposes to employ them to determine the degree of polymerisation of certain electrolytes. R. V. S.

A Case of Electrolytic Saturation Current. GEORGE JAFFE (*Ann. Physik*, 1911, [iv], 38, 25—48).—Measurements of the electrolytic conductivity of solutions of lead oleate in hexane and light petrol indicate that saturation currents can be obtained similar to those observed in the ionisation of gases. The conductivity apparatus consisted of a condenser with guard-ring and parallel electrodes the distance between which could be varied. The applied potential differences were varied from 500 to 3000 volts per cm., and it

current measured by means of a Curie piezo-quartz apparatus with a Dolezel electrometer as null instrument. For potentials (e) greater than about 500 volts per cm. the current (i) can be represented by the equation $i = a + ce$, in which a and c are constants. Since a is relatively very large, it follows that the current is mainly carried by ions which are formed at such a slow rate that a condition of saturation is attained. The residual current (ce) is probably due to impurities which it is impossible to avoid entirely.

It is shown that the rates of formation and of re-combination of the ions of the lead oleate can be deduced from the experimental observations. Both processes are of the second order, and the degree of ionisation is therefore independent of the concentration of the salt. From experiments on the influence of temperature on the conductivity, it is found that the temperature-coefficient of the rate of formation of the ions is negative between 0° and room temperature, and then becomes positive as the temperature rises further.

Some observations relating to the conductivity of solutions of ethyl alcohol in light petroleum are also recorded. Under ordinary conditions, such solutions exhibit unipolarity, a negative temperature-coefficient, and an abnormally rapid increase of the current with increasing potential. This is found to be due to traces of impurities, for when carefully purified materials are employed, the anomalous phenomena disappear.

H. M. D.

Magneto-optical Effects Exhibited by Chlorine and Iodine.

A. HZRUHO (*Ann. Physik*, 1911, [iv], 36, 153—176).—Two forms of apparatus are described by means of which the author has investigated the influence of a magnetic field on the optical behaviour of chlorine and iodine, both of which give a banded absorption spectrum. In the case of chlorine the rotation of the plane of polarisation was measured for wave-lengths varying from $\lambda = 518\mu\mu$ to $\lambda = 640\mu\mu$, but the data show no appreciable increase in rotation in the region of absorption. The behaviour of an absorption band towards a magnetic field appears therefore to be quite different from that of individual absorption lines.

From observations with iodine vapour between crossed nicols, it has been found that the application of a magnetic field gives rise to considerable illumination in the green part of the spectrum, and several new lines make their appearance. This magneto-optical effect could not be eliminated by rotation of the analyser or by the insertion of a quarter-wave plate, from which it appears that only a small portion of the light is polarised. The effect of the magnetic field on the individual absorption lines obtained by using a grating was also examined, but no change could be detected. Between crossed nicols, some of these lines become brighter when the field is applied, but the resulting light emission is not polarised to more than a small extent.

H. M. D.

Adjustable Electric Signal Thermometer. FRANZ MICHEL (*Chem. Zeit.*, 1911, 35, 1111).—An apparatus on the principle of Beckmann's thermometer, so arranged that electrical contact will be

made at any pre-arranged temperature and an audible or visible signal thereon given.

L. DE K.

Specific Heat of Water. ANDRÉ COTTY (*Ann. Chim. Phys.*, 1911, [viii], 24, 282—288).—Determinations of the specific heat of water in a Bunsen calorimeter, provided with a special device for measuring the temperature of the water added, show that the specific heat is 1.0067 at 0°, diminishes to 0.9994 at 20°, and then rises to 1.005 at 35°. The specific heat at 15° is taken as unity. These figures agree closely with those of Bartoli and Stracciati (*Abstr.*, 1893, ii, 443, 1895, ii, 5, 6).

T. A. H.

Measurements of Specific Heat at Low Temperatures with the Copper Calorimeter. F. KORR (*Ann. Physik*, 1911, [iv], 36, 49—73).—The copper calorimeter described by Nernst and Lindemann (*Abstr.*, 1910, ii, 263) has been employed for the measurement of the mean specific heats of a large number of substances over the temperature intervals -190° to -80° and -80° to 0° . It is shown that accurate results can be obtained by the author's method of operating which is described in detail.

Data are recorded for aluminium, copper, zinc, lithium, sodium, potassium, boron, graphite, diamond, bromine, the halogen salts of sodium and potassium, calcium fluoride, oxide, hydroxide and carbonate, silver iodide, lead iodide, quartz and carbon disulphide. In addition, the latent heat of vaporisation of carbon disulphide was measured, the mean value obtained being 86.87 cal. The experimental data are finally discussed from the point of view of Nernst's heat theorem, and also in relation to the Planck-Einstein theory of energy quanta.

H. M. D.

The Energy Content of Solid Substances. WALTHER NERNST (*Ann. Physik*, 1911, [iv], 36, 395—439).—The chief results of the work described in this paper have been published previously (compare *Abstr.*, 1910, ii, 263; this vol., ii, 368, 464, 466). The substances for which the energy content can be calculated with the aid of a single frequency number include both elements and compounds, the latter being such that the vibration frequencies of the component atoms are nearly equal. For other elements, such as sulphur and carbon (as graphite), and compounds like silica (quartz), lead chloride, silver chloride, mercurous chloride, silver iodide, and benzene, the use of two or more frequency numbers is necessary. These frequencies have been calculated in a number of cases, and from these the values of the energy content are derived and compared with the experimental values.

From the observed convergence of the atomic heats of solid crystalline and amorphous substances towards zero at very low temperatures, it follows that the conception of temperature ceases to have any meaning in respect of all those properties which are dependent on the average behaviour of the atoms. Such properties are, for example, energy content, volume, compressibility, and chemical potential, and since chemical potential is a measure of free energy, it appears that the author's heat theorem must be regarded as a special case of a more general principle.

On the basis of the knowledge furnished by this investigation of the variation of the energy content with the temperature, the way has been paved for the development of a theory of the solid state of aggregation which should allow of the deduction of the most important properties of solids in a simple manner. H. M. D.

Prevention of Bumping. H. SPURRIER (*J. Amer. Chem. Soc.*, 1911, 33, 1632—1633).—It is sometimes necessary, especially in soap and oil analyses, to remove alcohol from an aqueous solution which is covered with a layer of oil. In boiling such a liquid great inconvenience is caused by bumping. This difficulty can be overcome by introducing a piece of glass tube, open at both ends, into the vessel, one end of the tube being below, and the other above, the surface of the liquid. If a beaker is used, it should be covered whilst ebullition is proceeding, in order to prevent loss by the spouting of small quantities of the liquid up the tube. E. G.

A Simple Direct Electrical Method of Determining Heats of Vaporisation. NICOLAI N. NAGORNOFF and L. ROTUNJANZ (*Zeitsch. physikal. Chem.*, 1911, 77, 700—706).—The comparison method with electrical heating described by Marshall and Ramsay (compare Abstr., 1896, ii, 349) is employed. The arrangement used is described and figured, and the mode of working described in detail. The external glass mantle, a cylindrical vessel 6 cm. wide and 17 cm. long, is sealed on to a Liebig's condenser and is well insulated. The boiling vessel, a glass beaker 4 cm. wide and 11 cm. high, is filled with the liquid to be vaporised, and rests on narrow supports on the base of the outer vessel, which is closed by a well-ground stopper through which the wires conveying the current pass. For further details the original paper must be consulted.

It is shown that the results are in good agreement with those obtained by previous observers by the electrical method, but are rather higher than those obtained by the calorimetric method. The cause of this discrepancy has not been elucidated.

The heats of vaporisation of certain compounds, in calories per gram, are as follows: *cyclohexane*, 85.4; *methylcyclohexane*, 76.4; *chlorocyclohexane*, 74.9; *cyclohexanol*, 108.1; *ethyl n-propyl ether*, 82.7, and *ethyl isobutyl ether*, 74.9. The value of Trouton's constant for all the compounds examined is close to 21.0, except for *cyclohexanol*, which, like other hydroxyl compounds, gives a much higher value (21.9). G. S.

Relation of Heat of Vaporisation to other Constants at the Boiling Temperature of Some Liquids at Atmospheric Pressure. JACK P. MONTGOMERY (*Amer. Chem. J.*, 1911, 46, 298—307).—For a number of non-associated liquids which yield normal vapours, certain relationships are shown to exist at the ordinary boiling point. For such normal liquids the heat of vaporisation is proportional to the volume of unit weight of the saturated vapour; it is also proportional to the square of the velocity of the molecules. The quantity of heat required to vaporise unit volume of such a liquid is

proportional to the number of molecules in this volume and to the absolute temperature. In the case of isomeric substances the absolute boiling temperature is in many cases proportional to the density of the liquid at the boiling point. Finally, the absolute boiling temperature is directly proportional to the molecular weight and to the square root of the number of atoms in the molecule, and inversely proportional to the relative size of the molecules as measured by the quantity b in van der Waals' equation.

From a consideration of these relationships, the conclusion is drawn that none of the heat of vaporisation is required for intra-molecular work, but that all the heat is used up in overcoming cohesion and in giving the molecules sufficient kinetic energy to balance the pressure of the surrounding atmosphere.

H. M. D.

Molecular Attraction and the Properties of Liquids
RICHARD D. KLEEMAN (*Phil. Mag.*, 1911, [vi], 22, 566—586. Compare this vol., ii, 257).—A theoretical paper in which various forms of the equations connecting the internal heat of vaporisation and the surface tension of liquids with the temperature, density, and the density of the saturated vapour are further discussed.

H. M. D.

[Variation of Vapour Pressure with Temperature.] IVAN W. CEDERBERG (*Zeitsch. physikal. Chem.*, 1911, 77, 707—718).—On the basis of considerations partly theoretical and partly experimental, the vapour-pressure formula: $A \log^2 p + B \log p + C = \theta_0/T - 1$ is deduced, where θ_0 is the critical temperature on the absolute scale, and A , B , and C are constants to be determined from the experimental data. In the form $\log p = [A' - (B\theta_0)/T]^2 - C'$, where A' , B' , and C' are new constants, this formula has been tested through a wide range of temperature from -10° upwards, and is found to represent the experimental results more satisfactorily than any other formula hitherto proposed. At very low temperatures, Nerst's well-known formula gives slightly better results.

G. S.

Apparatus for Continuous Working in Fractional Distillations in a Vacuum. LUIGI FRANCESCONI and E. SERNAGIOTTO (*Atti R. Accad. Lincei*, 1911, [v], 20, ii, 30—35).—The apparatus carries two flasks as receivers, and is so constructed that either of them can be removed and replaced without altering the pressure inside the apparatus even momentarily, so that the distillation may be really continuous.

R. V. S.

Heat of Combination of Acidic Oxides with Sodium Oxide.
VII. WILLIAM G. MIXER (*Amer. J. Sci.*, 1911, [iv], 32, 202—206. Compare Abstr., 1910, ii, 585, 828).—The heat changes involved in the action of sodium peroxide on copper, silver and gold, and the corresponding oxides have been determined. The results show that the higher oxides of these metals combine with sodium oxide with considerable development of heat to form compounds which are stable at high temperatures. The following data are recorded.
 $\text{CuO} + \text{O} + \text{Na}_2\text{O} = \text{Na}_2\text{O} \cdot \text{CuO}_2 + 29500 \text{ cal.}; 2\text{Ag} + 2\text{Na}_2\text{O}_2 =$

$\text{Na}_2\text{O} \cdot \text{Ag}_2\text{O}_2 + \text{Na}_2\text{O} + 6000 \text{ cal.}$; $2\text{Ag} + \text{O}_2 + \text{Na}_2\text{O} = \text{Na}_2\text{O} \cdot \text{Ag}_2\text{O}_2 + 44980 \text{ cal.}$; $\text{Ag}_2\text{O} + \text{O} + \text{Na}_2\text{O} = \text{Na}_2\text{O} \cdot \text{Ag}_2\text{O}_2 + 39400 \text{ cal.}$; $2\text{Ag} + \text{O} = 44980 \text{ cal.}$; $\text{Ag}_2\text{O} + 5400 \text{ cal.}$; $2\text{Au} + 3\text{Na}_2\text{O}_2 = 3\text{Na}_2\text{O} \cdot \text{Au}_2\text{O}_3 + 30400 \text{ cal.}$; $\text{Au}_2\text{O}_3 + 3\text{Na}_2\text{O} = 3\text{Na}_2\text{O} \cdot \text{Au}_2\text{O}_3 + 100900 \text{ cal.}$; $2\text{Au} + 3\text{O} = \text{Au}_2\text{O}_3 - 12300 \text{ cal.}$
 H. M. D.

Thermochemical Studies. IV. Diazo- and Azo-compounds. WOJCIECH SVENTOSLAVSKY (*Ber.*, 1911, 44, 2429—2437.* Compare Abstr., 1910, ii, 588, 691).—The measurements already described (*loc. cit.*) have been repeated with improved methods, care being taken, in particular, to maintain the experimental room below 3° . The results are substantially as before, with the exception that the heat of neutralisation of benzenediazonium hydroxide is 11.68 cal. instead of 13.7 cal. The heats of neutralisation of *o*- and *p*-tolyl-diazonium hydroxides are 12.06 cal. and 13 cal. respectively. The heat of formation of the normal diazo-salts when hydrolysis is almost completely absent is 6.85 cal. for diazobenzene and 5.34 cal. for *p*-diazotoluene.
 E. F. A.

Thermochemical Studies. V. Diazo- and Azo-compounds. Monoamines. WOJCIECH SVENTOSLAVSKY (*Ber.*, 1911, 44, 2437—2445.† Compare Abstr., 1910, ii, 588, 691).—The heats of diazotisation of a number of mono- and di-amines have been determined by the methods already described (*loc. cit.*). The heat of diazotisation of the NH_2 group varies slightly with the constitution of the amine; it depends on three factors, the heat of neutralisation of the diazonium compound, the true heat of diazotisation, and the heat of salt formation of the amine. The introduction of a methyl group in the *ortho*-position increases the magnitude of the first two factors. The heats of diazotisation of benzidine and dianisidine are less than those of aniline and *o*-toluidine; this is probably due to the influence of the adjoining phenyl radicles on the basic nature of the diazonium base. The heat of formation of the diazo-salt is greater for derivatives of benzidine and dianisidine than for diazobenzene and its homologues. The heat of combination of the diazo-compounds with β -naphthol is more nearly a constant, but a correction must be applied for the difference between the heat of neutralisation of the diazonium hydroxide and of sodium hydroxide.
 E. F. A.

Pyknometer for Density Determinations. LUDWIG VON KARYSIO (*Chem. Zeit.*, 1911, 35, 1120).—The determination of the density of viscous liquids is often accompanied by difficulties caused by the liquid adhering to the parts of the pyknometer above the mark, etc. The pyknometer devised by the author consists of a small flask fitted with a stop-cock in the lower part of the neck. The bore of the stop-cock is very wide, and there are two holes of the same width in the neck of the flask where the stopper fits. In making a density determination, the flask is filled with the viscous liquid, the stop-cock connecting with the body of the flask and the neck. When the temperature is constant, the stopper is turned through 90° , and any

* and *J. Russ. Phys. Chem. Soc.*, 1911, 43, 1060—1075.

† and *J. Russ. Phys. Chem. Soc.*, 1911, 43, 1076—1083.

liquid in the neck and bore of the stopper is removed by means of a volatile solvent, after which the weighing can be made. The results are trustworthy to the fourth decimal place.

T. S. P.

Volume Changes in the Formation of Solutions. HERMANN WOLFF (*Ann. Physik*, 1911, [iv], 36, 177—182).—From a consideration of the free energy changes, the author deduces a relationship between the differential volume effects which accompany the absorption of small quantities of water or alcohol by a given mixture of these two substances. Available data are insufficient to test the validity of the differential equation.

H. M. D.

Viscosity and Fluidity of Suspensions of Finely-divided Solids in Liquids. EUGENE C. BIKHAM and T. C. DURHAM (*Am. Chem. J.*, 1911, 43, 278—279. Compare this vol., ii, 372).—The viscosity of suspensions of infusorial earth, china clay, and graphite ("Aquadag") in water and ethyl alcohol has been measured at different temperatures by means of an Ostwald viscometer having a capillary of relatively large diameter and about 40 cm. long. The fluidity decreases rapidly as the proportion of the suspended solid increases, the decrease being directly proportional to the volume concentration of the solid. By extrapolation of the fluidity concentration curves it is found that the fluidity becomes zero at a definite concentration which is independent of the temperature and of the dimensions of the particular apparatus used in the viscosity determinations. The volume concentration corresponding with zero fluidity varies with the nature of the solid suspension, and when the same solid is suspended in different liquids the zero fluidity concentrations are not necessarily the same.

The fluidity of solid suspensions in water is altered considerably when small quantities of electrolytes are added, hydrogen and hydroxyl ions having a specially large influence.

Incidentally, attention is drawn to the considerable errors which frequently occur in the use of Ostwald viscometers as a consequence of the neglect to take into account the kinetic energy imparted to the liquid in its motion through the capillary.

H. M. D.

The Viscosity of Binary Liquid Mixtures in the Neighbourhood of the Critical Dissolution Temperature. PAUL DRAPIER (*Bull. Acad. roy. Belg.*, 1911, 621—640).—Measurements of the viscosity of cyclohexane, nitrobenzene, aniline and *n*-hexane, and of various mixtures of the first pair and the last pair of liquids have been made at a series of temperatures in the neighbourhood of the respective critical dissolution temperature.

In the case of the pure liquids, the fluidity diminishes with rise of temperature according to the equation $\phi = a + b(t - 2t_c)$. Mixtures exhibit a similar relationship at temperatures much higher than the critical dissolution temperature, but as this temperature is approached the fluidity temperature curves show marked deviations and become concave to the temperature axis.

The fluidity of the two series of binary mixtures can be additively represented in terms of the fluidities of the components if the

temperature is sufficiently removed from the critical, but in the neighbourhood of this dissolution temperature the isothermal fluidity concentration curves deviate considerably from the requirements of the additive law. The observed variations in viscosity are supposed to be connected with certain changes in the liquid which give rise to the phenomenon of opalescence, and in this connexion reference is made to the possibility of explaining the viscosity relationships on the basis of the views of Donnan and of Smoluchowski. H. M. D.

Adsorption of Solutions. II. GERHARD C. SCHMIDT (*Zeitsch. physikal. Chem.*, 1911, 77, 641—660).—In a previous paper (Abstr., 1910, ii, 1041) a formula was proposed which represents satisfactorily the adsorption by charcoal of acetic acid from aqueous solution through a considerable range of concentration. For still greater variations of concentration, however, the formula is not valid, nor does it express the fact that adsorption is an equilibrium phenomenon. Regarding the amount of adsorption as determined by equilibrium between the adsorbing force and the solution pressure, the formula $(a-x)S/v = Kx^{1/2}S^{1/2}$ is deduced, in which x represents the amount adsorbed, a the amount of solute originally present, v the volume, S the maximum amount adsorbed, and A and K are constants. The formula represents the results satisfactorily when the concentration of the charcoal is varied in the ratio 1:8, and that of the acetic acid in the ratio 1:3000.

The objections raised by Marc (compare this vol., ii, 238) to the author's theory are not valid. In particular, there is no evidence of discontinuity in the adsorption curve of acetic acid by charcoal, as suggested by Marc. G. S.

Anomalous Adsorption. ALFRED LOTTERMOSER (*Zeitsch. Chem. Ind. Kolloide*, 1911, 9, 135—136).—The occurrence of maximum adsorption at a particular concentration, which was observed by Biltz (Abstr., 1910, ii, 830) in the adsorption of certain colouring matters, has also been found by the author in the adsorption of potassium iodide from aqueous solution by silver iodide. This anomalous behaviour is found to be due to an increase in the size of the silver iodide particles under the influence of the potassium iodide solution. The solvent action of the more dilute solutions and the precipitation which accompanies increase in concentration lead to the formation of a more dense and apparently crystalline modification from the originally amorphous silver iodide. H. M. D.

Diffusion of Electrolytes in Colloids. LUIGI ROLLA (*Atti R. Accad. Lincei*, 1911, [v], 20, ii, 47—51).—The author has worked out a method for determining the coefficient of diffusion, k^2 , in Fourier's equation: $\partial c/\partial t = k^2 \partial^2 c/\partial x^2$ by measurement of the time elapsing before the maximum electromotive force is attained between two electrodes immersed in gelatin into which an electrolyte is allowed to diffuse. The arrangement employed consists of a glass tube containing two parallel, plane, circular, silver disks, which are perforated with many small holes. The tube is filled with pure gelatin in such a

manner that the surface of the gel at the bottom of the tube is plane and parallel to the electrodes. A solution of the electrolyte (potassium chloride, sodium chloride) is circulated past this gelatin surface for a short time; pure water is then substituted for the electrolyte (so that the concentration on the external surface of the gelatin is zero), and the time required for the electromotive force to reach a maximum is observed. The results agree well with those obtained by other methods.

R. V. S.

Aggregation and Crystallisation of Water in Connection with the Physical Condition of Substances. I. SAWOZOFF (*Zeitsch. Chem. Ind. Kolloide*, 1911, 9, 107—112).—Observations relating to the formation and liquefaction of ice crystals are described which lead the author to the conclusion that liquid water must be regarded as having a definite molecular structure ("latent crystallized structure") and not as a chaotic aggregation of molecules, as is usually assumed. In reference to this view, the physical properties of water in the different states of aggregation are examined in some detail.

H. M. D.

Isomerism and Polymorphism. HANS STORBE (*Ber.*, 1911, 44, 2732—2735).—The author's views (*Abstr.*, 1910, i, 623) having been misunderstood by Billmann (this vol., i, 367), the former discusses them again.

Where in two substances having the same empirical composition, the atoms are differently arranged in dissimilar molecules, the substances are isomeric chemical compounds, but where identical molecules are differently grouped in dissimilar crystals, the substances are two forms of presentation (*Erscheinungsformen*), two species (*Gattungen*) or modifications of a single polymorphous chemical compound. Where the two substances are isomerides, their differences are present, not only in the crystalline form, but also in the dissolved and fused states. With the two modifications of a single chemical compound, however, the two solutions are identical, as also are the two fused masses. On these assumptions, the limits between isomerism and polymorphism are sharply drawn, and there is no limiting region, such as Billmann imagines from the author's previous considerations.

To determine which of these two cases exists in a particular instance often presents considerable practical difficulties, especially when the two individuals either have closely approximating physical constants or show a high velocity of transformation. The author regards calc spar and aragonite as two modifications of dimorphous calcium carbonate; rutile, anatase, and brookite as three modifications of trimorphous titanium oxide, and the four crystallographically different monocloroacetic acids as modifications of a single tetramorphous acid, and so on; and, in general, he regards such chemical compounds as polymorphous so long as there is no certain proof of the existence of two chemically different calcium carbonates, etc. He regards it as beyond doubt, however, that improved methods will in some cases result in compounds at present looked on as modifications

of "one" dimorphous chemical substance being considered later as "two" truly isomeric compounds (compare Schaum, Abstr., 1910, i, 391). T. H. P.

* Colloidal Chemistry of Histological Silver Staining. RAPHAEL K. LIEBERMAN (*Koll. Chem. Beihfte*, 1911, 3, 1—46).—Cajal's method of staining nerve tissue by means of a silver solution has been examined from the colloido-chemical point of view, and the conditions are formulated which must be observed in order to ensure satisfactory preparations. A comparison is made between the various phases of the staining process and those involved in the development, toning, and fixing of a photographic plate. H. M. D.

The Significance of the Degree of Dispersity in the Investigation of the General Properties of Sulphur Hydrosols. SVEN ODEN (*Zeitsch. Chem. Ind. Kolloide*, 1911, 9, 100—106).—Methods of preparing sulphur hydrosols are described which yield particles of approximately uniform size. With these hydrosol preparations, experiments have been made to test the validity of Svedberg's equation: $S = e^{k(t-t_0)}$, in which S represents the percentage concentration of the colloidal sulphur, t the temperature of the solution, k and t_0 constants which depend on the degree of dispersity of the hydrosol and the concentration of electrolyte in the solution (compare Abstr., 1909, ii, 309). For a given degree of dispersity, k is nearly independent of the concentration of the electrolyte (sodium chloride), whilst t_0 increases with the quantity of the coagulant. For a given salt concentration, k and t_0 diminish as the degree of dispersity of the hydrosol increases, the rate of diminution of t_0 being much greater than that of k . The addition of acids in small quantities reduces the value of t_0 , whilst k remains unchanged. The validity of the exponential equation may be employed as a means of testing the uniformity of size of the particles of hydrosol. When particles of different sizes are present, this equation is incapable of representing the dependence of the equilibrium between the coagulum and the solution on the temperature.

The influence of temperature on the equilibrium which results when unequally granulated hydrosols are coagulated and of the degree of dispersity on the salt-fixing capacity of the coagulum are also discussed.

H. M. D.

Coagulation of Copper Ferrocyanide. NICOLA PAPPADÀ (*Zeitsch. Chem. Ind. Kolloide*, 1911, 9, 136—138).—A chemically pure colloidal solution of copper ferrocyanide can be obtained by prolonged dialysis of the solution obtained in the interaction of copper chloride or sulphate and sodium ferrocyanide in equivalent proportions. The influence of various electrolytes on the coagulation of the negatively-charged colloidal particles has been examined in some detail. These experiments show that coagulation is determined by the cations, the nature of the anion having little influence on the coagulating power of the electrolytes. For cations of different valency this coagulating power increases with the magnitude of the electric charge. In the

case of the alkali metals, it increases with increasing atomic weight and with increasing velocity of diffusion of the cation. H. M. D.

Plasticity, Especially of Barium Sulphate. PAUL EHRENSBERG (*Zeitsch. angew. Chem.*, 1911, 24, 1957—1958).—Polemical against Atterberg (this vol., ii, 605), the author especially combating his view, on the cause of plasticity. T. S. P.

Formation of Layers in Heterogeneous Systems. EMIL HATSCHEK (*Zeitsch. Chem. Ind. Kolloide*, 1911, 9, 97—100).—If a system consisting of two different kinds of particles is acted on by an external force, which causes the two sets of particles to move with uniform speed, but with different velocities, a simple graphical consideration indicates that this motion must result in the setting up of a series of alternating strata. The stratification which is found when insoluble substances are formed as the result of the action of an aqueous solution of one substance on a solid jelly containing the second reacting component, can be explained satisfactorily by reference to the velocities of the reacting molecules or ions. The view that this stratification is due to the formation of supersaturated solutions is considered to be very improbable. H. M. D.

General Integrals of Chemical Kinetics. FERENCZ JUTTNER (*Zeitsch. physikal. Chem.*, 1911, 77, 735—743).—The integrals for the differential equation expressing the rate of reversible reactions are obtained, and certain deductions regarding the integrals of irreversible reactions and regarding chemical equilibria are given. G. S.

Equilibria in the Precipitation of Lead Carbonate. WALTER HEAZ (*Zeitsch. anorg. Chem.*, 1911, 72, 106—108).—Sodium carbonate solution has been shaken with several sparingly soluble lead salts at 25°, and the equilibrium determined by analysis. Equilibrium constants are obtained for the bromide, chloride, and sulphate. C. H. D.

Reduction of Mercuric Chloride by Phosphorous Acid and the Law of Mass Action. JAMES B. GARNER, JOHN E. FOGLESON, and ROGER WILSON (*Amer. Chem. J.*, 1911, 46, 361—368).—It has been observed that the action of phosphorous acid on mercuric chloride proceeds very slowly in dilute aqueous solutions at the ordinary temperature. It was, therefore, considered of interest to determine the extent of the reaction, the effect of different temperatures and concentrations, and the order of the reaction.

The results have shown that at 25° and 30°, and at various concentrations, the reaction takes place in accordance with the equation $2\text{HgCl}_2 + \text{H}_3\text{PO}_3 + \text{H}_2\text{O} \rightarrow \text{H}_2\text{PO}_4 + 2\text{HgCl} + 2\text{HCl}$. There is no equilibrium point, but the reaction proceeds to completion. It is demonstrated that the reaction is of the fourth order, and its velocity constant is therefore expressed by the equation:

$$K = 1/3[1/(a - x)^3 - 1/a^3]. \quad \text{E. G.}$$

The Composition of Solid Phases in Four Component Systems. JAMES M. BELL (*J. Physical Chem.*, 1911, 15, 580—586. Compare Schreinemaker, *Abstr.*, 1909, ii, 559).—Four component systems are qualitatively represented by a tetrahedral diagram in perspective. For quantitative purposes the space diagram must be projected on to two of the faces of the tetrahedron. For this purpose orthogonal projection and projection by lines parallel to one edge of the tetrahedron have been employed. The author discusses a method of "perspective" projection in which the lines radiate from the apex of the tetrahedron to project the curve on the base. The method, which is illustrated by reference to the system

is more complicated than parallel projections.

R. J. C.

The Thermal Analysis of Quaternary Systems. NICOLA PARRAVANO and G. SROVICH (*Atti. R. Accad. Lincei*, 1911, [v], 20, ii, 206—211).—The tetrahedral method of representation may be used for quaternary systems, each face representing one of the component ternary systems. The course of the eutectic lines and planes is traced in the simple case in which neither compounds nor solid solutions are formed. In the thermal analysis of such systems, mixtures may be so chosen as to lie on a plane passing through one edge of the tetrahedron and a given point, and the isothermals are then drawn on the isosceles triangle thus obtained. It is shown how these curves are utilised for the construction of the isothermal surfaces in the space-model.

C. H. D.

Rates of Solution of Certain Metals in Dissolved Iodine and their Relation to the Diffusion Theory. RALPH G. VAN NINE and ROWLAND S. BOSWORTH (*Amer. J. Sci.*, 1911, [iv], 32, 207—224. Compare *Abstr.*, 1910, ii, 280).—Further measurements of the rates of dissolution of metals in aqueous solution of iodine containing dissolved iodides have been made, and these show that iron, cobalt, and nickel dissolve at the same rate as was previously found for cadmium, zinc, mercury, copper, and silver. From experiments with disks of cadmium, it is found that the rate of dissolution remains practically constant on the addition of sulphuric acid to the solution provided the acidity does not exceed 0.1*N*; when the acidity is further increased, the rate of dissolution diminishes. The rate at which cadmium dissolves is also dependent to a small extent on the nature of the dissolved iodide, and from the data for solutions containing potassium, cadmium, sodium, hydrogen, barium, lithium, magnesium, and calcium iodides, it appears that the velocity constants roughly correspond with what would be expected from the probable rates of diffusion of the corresponding tri-iodides.

Tin and magnesium dissolve more quickly than the other metals investigated. In the case of tin, this is supposed to be due to the primary formation of a stannous salt and the removal of iodine by the subsequent oxidation which occurs. The high velocity in the case of magnesium is probably due to the disturbing action of hydrogen bubbles which are evolved at the surface of the metal.

The results obtained are considered to support the view of Nernst that such dissolution processes are primarily determined by rates of diffusion.

H. M. D.

The Velocity of Hydration of Metaphosphoric Acid 1
D. BALAREFF (*Zeitsch. anorg. Chem.*, 1911, 72, 85-88. Compare Abstr., 1910, ii, 607, 951; this vol., ii, 107).—The velocity of hydration of metaphosphoric acid increases with the concentration of the aqueous solution in a linear manner, indicating that the hydration is accelerated by the metaphosphoric acid itself, and not by the hydrogens ions.

C. H. D.

Course of the Intramolecular Transformations between iso-Butyl and tert.-Butyl Bromides, and the Catalytic Action Thereby Coming into Play. ROOZA F. BAUNEL (*Annalen*, 1911, 384, 245-271. Compare this vol., i, 413).—In furtherance of the object of ascertaining the change of free energy in reactions between organic compounds of comparatively simple structure, the author has determined the amounts of iso- and of tert.-butyl bromides existing in equilibrium at a high temperature (*loc. cit.*). The change of free energy, however, cannot be calculated from this equilibrium ratio without a knowledge of the course of the dissociation of the bromides into olefine and hydrogen bromide. Michael and Leupold (this vol., i, 250), amongst others, have examined this dissociation, and, stating it to be independent of the presence of catalysts, have introduced the conception of "static equilibrium" to explain their results. According to the author, this conception is unnecessary, since the dissociation of the bromides is not independent of the presence of catalysts. The apparatus used is described and figured. It is found that the velocity of dissociation of both bromides in the gaseous state, particularly that of isobutyl bromide, is largely influenced by the degree of cleanliness of the walls of the vessel, and also by the presence of the liquid phase. The presence of the liquid phase also influences, although to a smaller extent, the velocity of the intramolecular transformation of the one bromide into the other. In no case has the intramolecular transformation been observed without accompanying dissociation, and the author is of opinion that the dissociation is an essential intermediate stage of the transformation.

C. S.

Velocity of Racemisation. WALTER HERZ (*Chem. Zentr.*, 1911, ii, 67; from *Jahresber. Schles. Ges. vaterland. Kult.*, 1911, reprint).—The rate of change of the optical rotation of hyoscyamine and scopolamine in the presence of bases was measured by Gadamer (compare Abstr., 1901, i, 605). The present author now shows that the rate at which racemisation occurs in these reactions is represented by the equation $kt = \log\{a/(a - 2x)\}$, where a represents the initial concentration, and x the amount changed. The racemisation constant of hyoscyamine at 5° is for sodium hydroxide, 6.5×10^{-3} , for tropine, 1.9×10^{-2} ; the constant of scopolamine at 2-4° is for sodium hydroxide, 0.77, for tropine, 1.9×10^{-2} . This method may be used for the measurement of hydroxyl ion concentrations.

G. S.

New Distillation Flask. ALFRED DAHLER (*Chem. Zeit.*, 1911, 36, 1037).—A flask which is suitable for use in the distillation of fatty acids under reduced pressure is described. The neck of the flask is closed by a rubber stopper through which passes a glass tube, the lower end of which is widened out so as to nearly touch the neck of the flask. A capillary tube is fitted down the centre of this glass tube, whilst a side-tube on the neck of the flask carries a thermometer, and is provided with a second side-tube which is connected with the condenser.
W. P. S.

Gas Generation Apparatus. GEORG PREUSS (*Chem. Zeit.*, 1911, 35, 1131).—A modified Kipp's apparatus provided with extra large tubulures into which are ground wash-flasks. By the usual groove and hole arrangement these also serve as taps.
L. DE K.

Tap for Hydrogen Sulphide Apparatus. JAMES H. WALTON, jun. (*J. Amer. Chem. Soc.*, 1911, 33, 1586—1587).—A special form of tap is described, which cannot be left open by the student. It consists essentially of a strong spring pinch-clip which is fastened on to a board and closes the thick-walled rubber tube through which the gas is delivered. The clip is opened by pressing an iron lever, and on releasing the lever the supply is instantly cut off. The rate of flow is regulated by a screw pinch-cock situated at a higher point on the rubber tube. It is advisable to enclose the tap in a box, so that the student has access only to the end of the lever and about two inches of the end of the rubber tube.
E. G.

An Extraction Apparatus. WALTER L. HALLE (*Biochem. Zeitsch.*, 1911, 36, 245—247).—The apparatus, which is figured, is constructed of metal, and is capable of containing 2 kg. of material. It is of the ordinary Soxhlet pattern, but with two special features. About half way up the ascending limb of the syphon there is an additional tube with a tap. If the latter is opened, the liquid in the extractor will syphon off when it is only half full. On the descending limb of the syphon, near the bottom, there is another tube and tap; by opening the latter and fixing a tube to a condenser, the organic solvent can be distilled off.
S. B. S.

Extraction Apparatus which Prevents the Formation of Emulsions. EMMANUEL POZZI-ESCOR (*Ann. Chim. anal.*, 1911, 16, 382—383).—When a liquid is extracted with an immiscible solvent, the emulsion which is liable to form may be prevented by the use of a separating funnel, from which the air may be exhausted before the liquid and solvent are shaken together. The stopper of the tube is pierced with a hole, which, by rotating the stopper, may be placed in connexion with a small side-tube on the neck of the funnel; the air is exhausted from the funnel through this side-tube, the stopper is turned so as to close the funnel, the contents of the latter are shaken, and should any trace of emulsion result, this may be broken down by allowing air to enter the funnel suddenly.
W. P. S.

Rapid Filtering Funnel. H. SPURRIER (*J. Amer. Chem. Soc.*, 1911, 33, 1584—1585).—The rate of filtration from an ordinary funnel can be increased to about two and a-half times the normal rate by etching deep lines extending from the apex of the funnel to pass about two-thirds of the way up the sides. The grooves are not large enough to allow a filter paper to be broken by the stream from a wash bottle, but are sufficiently wide for the filtrate to flow down. Such funnels are particularly useful for filtering gelatinous precipitates.

E. G.

Automatic Filter. MARSTON L. HAMLIN (*J. Amer. Chem. Soc.*, 1911, 33, 1584).—The apparatus described is designed for the filtration of large quantities of liquid containing a precipitate of such a character as to be capable of passing readily through the stem of a separating funnel. It has been used in filtering barium carbonate from large amounts of solution in the preparation of inositol.

A large separating funnel is placed on a ring-stand over an ordinary funnel containing a folded filter-paper, the lower end of the stem of the separating funnel being slightly above the apex of the paper. A tube passes through a rubber stopper in the neck of the separating funnel, and is led down so that its lower end is at the level at which it is desired to maintain the liquid in the lower funnel. The liquid is placed in the separating funnel, the stopper inserted, and the stop-cock opened. The solution then runs into the lower funnel until it reaches the tube, and thus prevents the admission of air to the upper vessel. When the level in the lower funnel has fallen sufficiently, a small amount of liquid is siphoned over into the separating funnel and the lower one fills up again.

E. G.

Method of Filling Reagent Bottles. JAMES H. WALTON, JR. (*J. Amer. Chem. Soc.*, 1911, 33, 1585—1586).—In order to enable students to fill their own reagent bottles with concentrated acids or other reagents without having to handle heavy bottles, a method has been devised by which the reagents are forced from the bottles by means of air-pressure. The bottles are placed on a table, two feet above which runs a pipe connected with the source of air-pressure. From this pipe valves are suspended by means of rubber tubing which fit into funnels which with delivery tubes are inserted through the stoppers of the bottles. The construction of these valves is described with the aid of a diagram. In the case of carboys, it has been found that the pressure required to force out the liquid is sufficient to drive out the stopper from the neck of the carboy, and a special arrangement has therefore been devised to prevent this.

E. G.

Lecture Experiment: The Fermentation of Pyruvic and Oxalacetic Acids. CARL NEUBERG and LASZLÓ KARCZAG (*Ber.*, 1911, 44, 2477—2479).—An application of the method already given (this vol., ii, 320, 520).

W. J. Y.

Inorganic Chemistry.

Isomeric Inorganic Compounds. ADOLPH LAW VOGEL (*J. Amer. Chem. Soc.*, 1911, 33, 1563—1566).—During the compilation of an index of inorganic compounds according to their condensed formulae, several new instances of isomerism and polymerism were observed. A list of these is now given, together with references to the papers in which the compounds are described. E. G.

Atomic Weight of Hydrogen. GUSTAVE D. HINRICHS (*Rev. gen. Chim. pure Appl.*, 1910, 13, 351—354).—A review of the various determinations of the atomic weight of hydrogen which have been carried out since the time of Berzelius; the author considers that from the most trustworthy results the atomic weight of hydrogen must be 1.0078 ($O = 16$). F. M. G. M.

The Sand-Filtration and Precipitation of Chalk Waters. A. T. NANKIVELL (*J. Hygiene*, 1911, 11, 235—258).—The ordinary submerged sand-filter bed is unsuitable for the purification of chalk waters. It removes micro-organisms, but favours the growth of algae and other organisms. It can be made effective by the deposition of aluminium hydroxide on the surface of the sand, and it is best to exclude the light. The Porter Clark process is not only efficient for softening chalk waters, and also is an efficient steriliser; it is more effective than filtration through sand and aluminium hydroxide.

W. D. H.

Amorphous Sulphur. VII. Freezing-point Curves of Liquid Sulphur on Separation of "Nacreous Sulphur" and Rhombic Sulphur Respectively. ALEXANDER SMITH and CHARLES M. CARSON (*Zeitsch. physikal. Chem.*, 1911, 77, 661—676. Compare *Abstr.*, 1903, ii, 139, 284; 1905, ii, 382, 580; 1906, ii, 157).—As there is no general agreement regarding the nomenclature of the different modifications of sulphur, the authors suggest the adoption of the symbols used by Muthmann. According to this, rhombic sulphur is represented by the symbol S_I , prismatic sulphur by S_{II} , the nacreous modification discovered by Gernez as S_{III} , and a fourth very labile monosymmetric modification (not further referred to in the paper) as S_{IV} . For mobile and viscous liquid sulphur the symbols S_A and S_L , which have met with general acceptance, are retained.

S_{III} can readily be obtained in lustrous, needle-shaped crystals by heating sulphur to a temperature exceeding 150° , then keeping at 98° , crystallisation being initiated by rubbing the inside of the tube with a glass rod.

For each of these modifications there is a freezing-point curve, depending on the relative proportions of S_A and S_L in the liquid with which the respective solids are in equilibrium. The respective freezing points when no S_L is present are known as "ideal" freezing points, and are obtained by extrapolation. The ideal freezing point of S_I is

119.25°, of S_{II} 112.8°, and of S_{III} 106.8°. The "natural" freezing point of S_I is 114.5° (3.6% of S_{II}), of S_{II} 110.2° (3.4% of S_{II}), and of S_{III} 103.4° (3.1% of S_{II}).

From the heat of fusion of monoclinic sulphur, as determined by Lewis and Randall (this vol., ii, 371), and the depression of the freezing point of S_I due to S_{II} , the conclusion is drawn that the formula of S_{II} is S_8 , which agrees with the vapour density determinations of Preuner and Schupp (compare Abstr., 1910, ii, 118).

With regard to some criticisms of Wigand (this vol., ii, 875), on the exact temperature of the equilibrium $S_I \rightarrow S_{II}$, the authors maintain the accuracy of their previous results.

G. S.

Metallographic and Photochemical Studies of the System Sulphur-Tellurium. MASUMI CHIKASHIGI (*Zeitsch. anorg. Chem.*, 1911, 72, 109—118*).—Thermal analysis shows that sulphur and tellurium do not form a compound. Two series of solid solutions are formed, of very limited concentration, and the eutectic point lies at 109° and 7% Te (compare also Pellini, Abstr., 1909, ii, 726; Jäger, *ibid.*, 1910, ii, 497). The transformation temperatures of sulphur at 400° and at 98.5° are lowered by tellurium. Whilst β -S holds 2% Te in solid solution, α -S retains only 0.5%, but the separation of the excess only takes place under the influence of light. Molten β -S dissolves 10% Te, and molten γ -S 20% Te. The precipitate obtained from solutions of tellurous acid and hydrogen sulphide, formerly supposed to be a compound TeS_2 , is a mixture.

The solid solutions containing less than 0.5% Te are not sensitive to light. They include the Japanese red sulphur. The supersaturated crystals, containing from 0.5 to 2% Te, change from red to yellow or brown when exposed to light, the most active rays being $\lambda = 4500$. The decomposed portions are more readily dissolved by carbon disulphide than the original crystals.

C. H. D.

Oxidation of Hydrazoic Acid [Azoimide]. HAROLD EATON RIEGGER (*J. Amer. Chem. Soc.*, 1911, 33, 1569—1576).—It has been shown by Browne and Shetterly (Abstr., 1909, ii, 658) that azoimide is produced in varying amounts by the oxidation of hydrazine in acid solution with different oxidising agents. Thiele (Abstr., 1908, ii, 949), has suggested that the lowness of the yields of azoimide obtained in this way by the action of certain oxidising agents is due to the ease with which azoimide itself undergoes oxidation. In order to test this hypothesis, experiments have now been made to ascertain the extent to which azoimide is oxidised in aqueous solution under conditions similar to those prevailing in the work on the oxidation of hydrazine.

The oxidising agents employed were (1) hydrogen peroxide, potassium chlorate, and potassium persulphate, which were found by Browne and Shetterly to oxidise hydrazine with formation of considerable amounts of azoimide; (2) potassium permanganate, manganese dioxide, and ferric oxide, which give but small quantities of azoimide under the same conditions; and (3) potassium iodate, which yields little or no azoimide.

* and *Mem. Coll. Sci. Eng. Kyoto*, 1911, 3, 197—210.

It has been found that of the reagents of the first class, hydrogen peroxide does not oxidise azoimide to an appreciable extent, potassium chlorate exerts a slight oxidising action, and potassium persulphate effects considerable oxidation. Of the oxidising agents belonging to the second class, potassium permanganate oxidises azoimide vigorously, manganese dioxide but slightly, and ferric oxide not appreciably. Potassium iodate does not oxidise the compound at all.

It is evident, therefore, that of the seven oxidising agents studied, only two, hydrogen peroxide and potassium permanganate, behave consistently with Thiele's explanation. A more satisfactory explanation is that proposed by Browne and Shetterly (*loc. cit.*), namely, that intermediate condensation products are formed during the oxidation, and that these decompose in different ways. E. G.

Theory of Silicates. FELIX SINGER (*Sprechsal*, 1911, 44, 52—54, 69—73).—A theoretical paper in which the author expresses his views on the constitution of some derivatives of felspar and other complex silicates, demonstrating the same by numerous graphic formulae. The work of Pukall (*Abstr.*, 1910, ii, 780), Thugutt, and Moroziewicz is also discussed. F. M. G. M.

Preparation of Colourless Alcoholic Potassium Hydroxide. HANS MALFATTI (*Zeitsch. anal. Chem.*, 1911, 50, 692).—Potassium hydroxide is rubbed in a mortar with fully an equal amount of calcium oxide, a little alcohol being added to prevent irritating dust. The paste thus obtained is transferred by means of alcohol to a flask, which is then filled with alcohol. After frequent shaking, the liquid is allowed to clear and then siphoned off.

This solution keeps colourless for years, even in presence of air. The author attributes this to the fact that the treatment with calcium oxide removes traces of colloidal metals (copper and iron, for instance), which, as shown experimentally, may be the cause of the darkening of the solution. L. DE K.

Double Salts Formed between Sparingly Soluble Sulphates and Alkali Sulphates. MAURICE BARRE (*Ann. Chim. Phys.*, 1911, viii, 24, 145—256. Compare *Abstr.*, 1909, ii, 667, 733; 1910, i, 710, 718, 781; this vol., ii, 42).—The results now given have been recorded previously in part (*loc. cit.*). The first portion of the paper is devoted to a study of the range of existence of the double salts of calcium, strontium, and lead with those of the alkali metals and ammonium. In the second portion a similar study is made of the double sulphates of (1) thorium and (2) cerium and lanthanum with the alkali metals, and a number of new compounds of this type are described in greater detail than before (*loc. cit.*). The solubilities of silver and mercurous sulphates in alkali sulphate solutions are also discussed.

At atmospheric temperature, and when less than 2.8% of potassium sulphate is in solution, no double salt is produced with calcium sulphate, but with more potassium sulphate, syngenite,

is formed. This begins to be replaced at temperatures above 31° by the compound $K_2SO_4 \cdot 5CaSO_4 \cdot H_2O$ (van't Hoff and others, *Abstr.*, 1904, ii, 561; 1905, ii, 319). With ammonium sulphate the compound $(NH_4)_2SO_4 \cdot CaSO_4 \cdot H_2O$ is alone stable at the lower temperatures; at 17° this begins to be transformed into $(NH_4)_2SO_4 \cdot 5CaSO_4 \cdot H_2O$, and the latter gives place completely to $(NH_4)_2SO_4 \cdot 2CaSO_4$ at 114° . The first begins to be transformed into the third directly at 73° . With sodium sulphate, sodium-syngenite, $Na_2SO_4 \cdot 2CaSO_4 \cdot H_2O$, begins to form at 30° , and its range of existence is largely coincident with that of glauberite, $Na_2SO_4 \cdot CaSO_4$, and there is no definite point at which one passes into the other, the former being always in a metastable condition and liable to change into glauberite (van't Hoff *Abstr.*, 1900, ii, 284).

Strontium sulphate and lead sulphate form no double sulphates with sodium sulphate, and barium sulphate does not combine with sodium, potassium, or ammonium sulphate in the conditions observed in these experiments. The heats of formation of the double salts referred to are tabulated in the original, which also contains graphs illustrating the ranges of existence of the various compounds, drawn from data given in this and the previous papers (*Abstr.*, 1909, ii, 667, 733).

The solubility of mercurous sulphate in water at 16.5° is 0.055%, and at 100° 0.092%; the quantities of free sulphuric acid formed at these two temperatures being 0.008% and 0.071% respectively (compare Drucker, *Abstr.*, 1902, ii, 74). The residue obtained by repeatedly washing mercurous sulphate with water has the composition assigned to it by Gouy (*Abstr.*, 1900, ii, 481), but as some metallic mercury is formed, the reaction must be more complex than is sometimes assumed. No double salt with potassium sulphate is formed.

From the data given previously (*Abstr.*, 1910, ii, 718; this vol. ii, 42) it appears that thorium cannot be completely separated from ceria by treatment of the two sulphates with excess of potassium sulphate solution, since a too concentrated solution of the latter would precipitate both salts completely. Sodium sulphate solution would give a better, but still incomplete, separation. A 1% sodium sulphate dilution dissolves 3 to 4 grams of thorium sulphate, but only 0.02 gram lanthanum sulphate or 0.007 gram of cerium sulphate. Ammonium sulphate solution cannot be applied usefully to effect this separation.

T. A. II.

Potassium Barium Orthothioantimonate. EMANUEL GLATZEL (*Zeitsch. anorg. Chem.*, 1911, 72, 100—105).—Antimony pentasulphide and barium hydrogen sulphide yield barium orthothioantimonate. Solid potassium chloride is added to the solution in about four times the quantity required by the equation $2KCl + Ba_2Sb_2S_5 + 2KBaSbS_4 + BaCl_2$. In order to prevent oxidation during evaporation, a solution of potassium hydrogen sulphide is added. The double salt separates slowly, and may be recrystallised from water containing potassium hydrogen sulphide.

Potassium barium orthothioantimonate,

forms colourless crystals which darken in air. When heated it melts, losing water, and solidifies on cooling to a crystalline mass.

C. H. D.

Preparation of Borax. II. MARIO G. LEVI and O. GARAVINI (*Gazzetta*, 1911, 41, i, 756—781. Compare Abstr., 1910, ii, 501).—In the present paper the investigation of the reaction between boric acid and sodium chloride is continued, and the reactions between boric anhydride and sodium chloride and between boric acid and sodium chloride are also dealt with.

In new experiments in which the temperature was raised only a little at a time, it is shown that, although the reaction between sodium chloride and boric acid has a greater velocity at 140° than at lower temperatures, yet it has begun at 120° , or perhaps even lower, and it would seem that metaboric acid also is able to displace boric acid from sodium chloride. At 170° the reaction does not proceed so far in the presence of borax as it does when borax is absent, and the authors consider that this favours their hypothesis that a state of equilibrium is reached in the mixture. The equilibrium which is reached at 150° is not altered below 500° ; between 500° and 600° a considerable evolution of free chlorine begins. Above 600° the limit of the reaction increases regularly, until at 1200° 75% of the sodium chloride is decomposed, or, if the heating at that temperature be prolonged, complete decomposition may occur. At the same time a loss of boric acid takes place which may reach 10%. The evolution of chlorine is less when the reaction is conducted in an atmosphere of nitrogen, but it is not abolished. Three possible causes of the evolution of chlorine are suggested: (1) oxidation of the hydrogen chloride (favoured by catalytic action of the solids present, as in Doacon's process); (2) the presence of boric anhydride; (3) dissociation of the hydrogen chloride itself, which is found to begin at 800° under these experimental conditions.

The action of boric anhydride on sodium chloride is accompanied with a considerable evolution of chlorine, which increases with the temperature. The reaction seems to begin at 500° (5% of sodium chloride decomposed after four hours). In this case also the decomposition of sodium chloride is less in an atmosphere of nitrogen. It is suggested that the reaction in the presence of air may follow the equation: $2B_2O_3 + 2NaCl + O = Na_2B_4O_7 + Cl_2$.

The velocity of reaction between boric acid and sodium sulphate is much less than in the case of sodium chloride; after four hours at 1200° only 59% of the sulphate is decomposed. The reaction begins at 500° , that is, above the probable temperature at which pyroboric acid is converted into the anhydride. In agreement with this, it is found that the reaction proceeds at about the same rate when boric anhydride is taken instead of boric acid. The sulphuric acid is almost entirely decomposed at the temperature of the experiments, yielding sulphur dioxide.

R. V. S.

Melting Temperatures of Sodium and Lithium Metasilicates. F. M. JAEGER (*J. Washington Acad. Sci.*, 1911, 1, 49—52).—Pure lithium metasilicate, prepared by repeatedly fusing

and grinding a mixture of lithium carbonate and quartz in the proper proportions, crystallises rapidly as glistening needles with $D_{20}^{20} = 1.526$. Its melting point, determined with the standard thermo-element of Day and Soeman (this vol., ii, 496), is sharply defined at 1291° , thus affording a suitable point (between copper, 1200° , and copper, 1391°) for calibration purposes. Owing to under-cooling to the extent of 100° the solidification temperature is variable.

The solidification temperature of sodium metasilicate has been given by previous observers at various points ranging between 1097° and 1056° . A nearly pure sample was found to melt at 1058° , but the temperature of solidification was disturbed by under-cooling.

L. J. S.

Lithium Silicates. II. R. RIEKE and K. ENDELL (*Spreressal*, 1911, 44, 97—99).—A continuation of previous work (this vol., ii, 490) on the physical and chemical properties of fused alkali silicates containing varying proportions of silica. The results are tabulated and exhibited in curves, whilst microphotographs illustrate the structure of the cooled substances.

F. M. G. M.

The Binary Systems of Magnesium and Calcium Chloride, with the Chlorides of Potassium, Sodium, Silver, Lead, Copper, Zinc, Tin, and Cadmium. OTTO MENGE (*Zeitsch. anorg. Chem.*, 1911, 72, 162—218).—In the thermal analysis of mixtures of chlorides, it is necessary to use equal volumes of each mixture, as the account of the low thermal conductivity an alteration of volume does not cause a proportional change in the arrest time. A volume of 2.5 c.c. is used, enclosed in a tube of Jena glass. Mixtures containing magnesium chloride undergo partial decomposition, so that the solidified mass must be dissolved in water and the separated magnesium oxide estimated.

Magnesium and calcium chlorides form a eutectiferous series, with the eutectic point at 621° and 42.8% CaCl_2 . Solid solutions are probably formed at the calcium end of the series. The freezing-point curve of mixtures of magnesium and potassium chlorides has two maxima at 485° and 437° , corresponding with the compounds $\text{KCl}, \text{MgCl}_2$ and $2\text{KCl}, \text{MgCl}_2$. This is confirmed microscopically. The curve for mixtures of magnesium and sodium chlorides has a eutectic point at 55% NaCl and 430° , and two breaks, indicating a compound $\text{NaCl}, \text{MgCl}_2$, and another of uncertain composition. Magnesium chloride forms simple eutectiferous series with silver, lead, cuprous, zinc, and stannous chlorides, the eutectic points, especially in the last two cases, being very close to the end of the diagram corresponding with the added chloride. Magnesium and cadmium chlorides are isomorphous, and give a continuous freezing-point curve.

Calcium and potassium chlorides give a freezing-point curve with a single conspicuous maximum, corresponding with the compound $\text{KCl}, \text{CaCl}_2$, m. p. 754° . The calcium-sodium chloride curve has a break at 600° , corresponding with the compound $4\text{NaCl}, \text{CaCl}_2$. The mixtures of calcium chloride with silver, lead, cuprous, zinc, and stannous chlorides closely resemble in their behaviour the mixtures

with magnesium chloride. Calcium and cadmium chlorides form a continuous series of solid solutions, the freezing-point curve showing a minimum, although the two salts are not isomorphous.

A comparison of the binary mixtures of the metals with those of the corresponding chlorides shows that when two metals of the group examined form intermetallic compounds, their chlorides do not combine, whilst metals which do not combine yield chlorides which form double salts.

C. H. D.

The System Water-Calcium Chloride-Calcium Hydroxide at 25°. FRANS A. H. SCHREINEMAKERS and TH. FIGER (*Chém. Weekblad*, 1911, 8, 683—688).—In this application of Schreinemakers' graphic method, two new oxychlorides of calcium, $\text{CaO}(\text{CaCl}_2) \cdot 2\text{H}_2\text{O}$ and $4(\text{CaO}) \cdot \text{CaCl}_2 \cdot 14\text{H}_2\text{O}$, have been isolated.

A. J. W.

Solubility of Zinc Oxide in Fused Lead Silicate and Borate. A. D. HOLDCROFT (*Trans. Eng. Ceramic Soc.*, 1909—1910, 9, 37—40).—An account of experiments in which varying quantities of zinc oxide were fused with lead silicate (litharge 78·8 parts, flint 21·2 parts) at 850° and 1000°, and the amount of zinc present in the fusions subsequently estimated; the lead silicate was also replaced by lead borate. The results indicated that at the lower temperature :—10 parts of zinc oxide dissolved in 100 parts of lead silicate, and 50—60 parts of zinc oxide in 100 parts of lead borate, whilst at 1000° the solubilities were 13—14 and 60—70 respectively.

F. M. G. M.

Potassium Ammonoplumbite. EDWARD C. FRANKLIN (*J. Physical Chem.*, 1911, 15, 509—520. Compare Abstr., 1905, ii, 581).—Lead imide (PbNH), prepared by the action of potassamide on lead iodide in liquid ammonia, is soluble in excess of potassamide. From the solution, *potassium ammonoplumbite* with ammonia of crystallisation was obtained. The substance, recrystallised from liquid ammonia in absence of air, forms large, colourless crystals, with the composition $\text{PbNK} \cdot 2\frac{1}{2}\text{NH}_3$. On drying at 20°, efflorescence takes place, and the composition becomes $\text{PbNK} \cdot 2\text{NH}_3$. At 100° the ammonia is further reduced, and a chocolate-brown substance of formula $\text{PbNK} \cdot \text{NH}_3$ remains. Above 100° no further loss of ammonia occurs, but at 140—145° the salt explodes.

The formula of the brown substance may be written $\text{NH}_2 \cdot \text{Pb} \cdot \text{NHNK}$ or $\text{PbNH} \cdot \text{KNH}_2$ or $\text{HPb}(\text{NH}) \cdot \text{NHNK}$. It is reconverted into the colourless variety on addition of ammonia. Potassium ammonoplumbite is discoloured by traces of air, and when exposed to the atmosphere or to water or dilute acids, explodes with violence. It is considered to be the ammonia analogue of potassium plumbite, although it has not been obtained free from the last molecule of ammonia of crystallisation.

R. J. C.

Lead Silicates. PAUL WEILLER (*Chem. Zeit.*, 1911, 35, 1063—1065. Compare Hilpert and Nacken, Abstr., 1910, ii, 955).—The thermal analysis of mixtures of lead oxide and silica shows that

the metasilicate, PbSiO_3 , is stable, but an orthosilicate is not formed. All mixtures containing more than 8% of silica yield a mass on cooling which is partly glassy and partly crystalline, whilst those containing from 12 to 32.5% SiO_2 form homogeneous glasses if rapidly cooled. Mixtures still richer in silica again show a tendency to crystallise, the glass being devitrified in parts.

The density curve shows a change of direction at the composition of the metasilicate, this compound being formed with expansion, and the further inclination of the curve points to the existence of a more acid silicate. The refractive index curve of the glassy mixtures shows a change of direction at the composition of the metasilicate.

The temperature at which reduction by hydrogen takes place is determined by observing the change of colour through a window in a vertical electric resistance furnace. This temperature remains constant at 240° in mixtures containing free lead oxide, but rises to 285° at the composition of the metasilicate, and again remains constant.

C. H. D.

Crystallographic Observations on Cerium Sulphate Tetrahydrate. ARISTIDE ROSATI (*Atti R. Accad. Lincei*, 1911, [v], 20, ii, 149—150).—Already quoted in a paper by Cingolani (*Abstr.*, 1910, ii, 385).

R. V. S.

Preparation of a Compound Containing Aluminium, Boric Acid, and Active Oxygen. CHEMISCHE FABRIK COSWIG-ANHAAR (D.R.P. 235050).—Compounds of aluminium and boric acid have previously been prepared. The compound, $\text{Al}_2\text{Na}_2\text{B}_2\text{O}_{11}\cdot 5\text{H}_2\text{O}$, containing 7—9% of active oxygen, was obtained by slowly treating a cooled solution of sodium aluminate (6.6 parts) with boric acid (5 parts) and 30 parts of a 10% solution of hydrogen peroxide; it forms a colourless powder, sparingly soluble in water, and gradually hydrolysed thereby, whilst it combines the disinfectant properties of both boric acid and hydrogen peroxide.

F. M. G. M.

Thermal Analysis of Binary Mixtures of the Chlorides of Bivalent Metals. CARLO SANDONNINI and G. SCARPA (*Atti R. Accad. Lincei*, 1911, [v], 20, ii, 61—68. Compare this vol., ii, 800; Ruz and Plato, *Abstr.*, 1903, ii, 588).—The paper deals with the thermal analysis of the systems SnCl_2 — PbCl_2 , MnCl_2 — CdCl_2 , SnCl_2 — MnCl_2 , MnCl_2 — SnCl_2 , and MnCl_2 — PbCl_2 .

The melting point of cadmium chloride is 568° (Ruff and Plato gave 598°); that of lead chloride is 495° , and that of manganese dichloride is 650° . Anhydrous manganese dichloride was prepared by heating the hydrated chloride in a current of dry hydrogen chloride; when heated in air it evolves chlorine, but in nitrogen it melts unchanged.

Stannous chloride and lead chloride give mixed crystals in all proportions, as also do cadmium chloride and manganous chloride.

The other pairs give simple eutectics; that of the system SnCl_2 — CdCl_2 lies at 233° (90 mols. % of stannous chloride); that of the system SnCl_2 — MnCl_2 is situated also at 233° (95 mols. % of

anous chloride); that of the system $\text{PbCl}_2\text{--MnCl}_2$ lies at 408° (70 mole % of lead chloride).
R. V. S.

Further Ferro-magnetic Compounds of Manganese. EDGAR WUNDERLIND and THEO. VEIT [with K. FETZER] (*Ber.*, 1911, 44, 2663—2670. Compare Abstr., 1909, ii, 541).—*Manganese bismuthide*, MnBi , was obtained by the interaction of manganese thermite and bismuth. It forms octahedral and eight-sided columnar crystals, which are strongly magnetic; it is very sensitive towards acids, with the exception of concentrated hydrochloric acid, which reacts very slowly and may be used for purification. The same compound was also obtained, but with difficulty, by the direct fusion of the components in an atmosphere of hydrogen.

Manganese selenide, MnSe , was formed by heating manganese and selenium in an evacuated bomb-tube. It is crystalline in structure, weakly magnetic, and readily decomposed by water and mineral acids, hydrogen selenide being evolved. The *telluride*, MnTe , was prepared in a similar way, and has similar properties; it is crystalline, and has a silvery lustre.

Manganese silicide, Mn_2Si , was obtained from manganese thermite and silicon as a crystalline, greyish-black powder, which is relatively stable towards acids, and has hardly any magnetic properties. The *sulfide*, MnS , was also prepared by the aluminothermic method; it is weakly magnetic, the magnetic properties becoming more pronounced on heating. The mineral alabandin behaves similarly. It has $d = 3.9$.

Manganese arsenide, was obtained by heating manganese and arsenic together. The resulting regulus was freed from manganese with dilute hydrochloric acid, and from excess of arsenic by heating in chlorine or bromine. A black, crystalline powder was left, which, on analysis, gave figures approximating to those calculated for MnAs . It was not pure, however, and on further heating in an electric oven, arsenic was lost and the compound Mn_3As formed (compare Hilpert and Dieckmann, following abstract). It is distinctly magnetic, in contradistinction to the arsenide first formed.

Manganese carbide cannot be prepared by the aluminothermic method. The compound, Mn_3C , obtained in the electric furnace is magnetic.

The compounds of manganese with trivalent elements are the most strongly magnetic.
T. S. P.

Arsenides. I. Iron and Manganese Arsenides. SIEGFRIED HILPERT and THEODOR DIECKMANN (*Ber.*, 1911, 44, 2378—2385).—The authors find that the best method for preparing pure arsenides of the metals is to heat them at a high temperature with the vapour of arsenic under pressure. The finely-powdered metal and the arsenic are sealed up in an evacuated bomb-tube of Jena glass, and heated for several hours at $700\text{--}750^\circ$, a temperature much higher than the boiling point of arsenic. After cooling, the almost chemically pure arsenide can be mechanically separated from the arsenic which has

condensed on the walls of the tube, and is then readily purified by further treatment.

Iron arsenide, FeAs_2 , after purification by treatment with dilute hydrochloric acid, was obtained as a silver-grey powder, which is probably microcrystalline. It is stable towards dilute and concentrated hydrochloric acid. The melting point, as determined by heating in a sealed quartz tube, lies between 980° and 1040° ; $D=7.54$. When heated at 680° in a current of hydrogen, the arsenide FeAs is obtained as a silver-white, crystalline powder. It is similar in its chemical properties to the diarsenide, and has m. p. 1020° and $D=7.51$. Both these arsenides are completely non-magnetic.

Manganese arsenide, MnAs , could only be obtained in the pure condition when manganese prepared from the amalgam was used. Alumino-thermic manganese did not give satisfactory results (compare Wedekind, Abstr., 1907, ii, 353). It is a greyish-black powder, showing, apparently, no crystalline structure, $D=6.2$; in its chemical properties it is similar to the iron arsenides. When heated in a current of hydrogen, arsenic is gradually volatilised, but no other compound is formed. It is strongly magnetic, but loses its magnetic properties when heated at 40 – 50° , the effect being a reversible one.

No evidence has been found for the existence of a compound Mn_2As (compare Wedekind, *loc. cit.*).

Phosphides may be prepared in a similar manner to the arsenides, and are to be reported on later.

T. S. P.

The Internal Structure of Martensite and Pearlite. M. OKNORF (*Metallurgie*, 1911, 8, 539–541).—The method of examining serial sections of steel (this vol., ii, 495) has been further applied, the thickness of the layer removed at each grinding being only 0.001 mm. The arrangement of ferrite and martensite in a steel containing 0.7% C, quenched from 750° , closely resembles that of ferrite and pearlite. Martensite, examined in a steel containing 0.5% C, quenched from 1000° , proves to be composed of plane lamellae, 0.003–0.007 mm. broad, and only 0.001 mm. thick. Pearlite, examined in annealed steel, proves to be composed of curved, parallel lamellae, about 0.001 mm. thick and of ten or twelve times that breadth.

C. H. D.

Formation of Iron Carbonyl. A. STOFFEL (*Chem. Weekblad*, 1911, 8, 722–734).—An investigation of the conditions governing the formation of iron pentacarbonyl. Up to 60° , the influence of temperature on the reaction is slight, but just below 80° , adsorption of the reaction product by the iron at first retards the formation of the carbonyl, and finally inhibits it. Above 80° dissociation stops the action, so that large quantities in the state of vapour cannot be formed.

The presence of ammonia accelerates the combination of carbon monoxide and iron; that of hydrogen sulphide exerts no influence.

A. J. W.

Peroxides. CARL TURANDT and W. RIEDEL (*Ber.*, 1911, 44, 2565-2570).—When a fine aqueous suspension of nickel peroxide is treated with dilute sulphuric acid, a solution is obtained which liberates iodine from potassium iodide, and decolorises permanganate to some extent. These reactions are not due to the formation of hydrogen peroxide (compare Tanatar, *Abstr.*, 1909, ii, 484), which is not present even in traces, since its presence cannot be detected either with titanium dioxide or with chromic acid and ether. The authors are of the opinion that the liberation of iodine is due to the formation of persulphuric acid, or of Caro's acid, even in the dilute sulphuric acid used. The decoloration of the permanganate is only apparent, the colour being masked by the green colour of the nickel solution, as may be shown by experiments with nickel sulphate.

The formation of hydrogen peroxide when nickel peroxide acts on a solution of hydrocyanic acid in the presence of potassium cyanide is verified (compare Tanatar, *loc. cit.*). It is not formed from the nickel peroxide, however, but by the auto-oxidising action of the complex nickel cyanides formed. This is supported by the fact that the nickel hydroxide, or any nickel salt, may be used in place of the peroxide.

There is thus no reason for placing nickel peroxide in a special class among the peroxides, and, moreover, the above results offer no support for Tanatar's views on the constitution of the peroxides. The work of Pellini and Meneghini (*Abstr.*, 1909, ii, 506, 486) is not affected by the above.
T. S. P.

Nickel Peroxide and its Behaviour in Salt Formation. CARL TURANDT and W. RIEDEL (*Zeitsch. anorg. Chem.*, 1911, 72, 219-232. Compare preceding abstract).—The oxidation of nickel salts with various oxidising agents yields only precipitates of nickel peroxide. The product of the action of cold acetic acid on nickel peroxide is not, as supposed by Benedict (*Abstr.*, 1906, i, 333), an acetate of trivalent nickel, but a colloidal solution of the peroxide, as is shown by ultramicroscopic investigation. Phosphoric acid forms very stable colloidal solutions of this kind. Concentrated phosphoric acid, on the other hand, forms a green solution, which contains the phosphorus analogue of Caro's acid (Schmidlin and Massini, *Abstr.*, 1910, ii, 488). Benedict's nickelic sulphate is a nickellous solution containing Caro's acid, and the red colour observed by him in portions of the filtrate is due to the presence of manganese, which is oxidised to permanganic acid by the nickel peroxide.

Strongly cooled alcoholic solutions of acids yield with nickel peroxide dark red solutions, which prove, however, to be colloidal. In the electrolysis of nickel cyanide solutions between platinum electrodes, dark red solutions are obtained, which have reducing properties, and contain the suboxide, Ni_2O . The electrolysis of alkali carbonate solutions containing nickel between nickel plates, using a diaphragm, yields a dark solution which contains only the colloidal peroxide. All attempts to obtain nickelic salts have, therefore, been unsuccessful.
C. H. D.

Uranium Hexafluoride. OTTO RUFF and ALFRED HEISELMANN (*Zeitsch. anorg. Chem.*, 1911, 72, 63—84).—Uranium hexafluoride have not been prepared previously. The hexafluoride has now been prepared in three ways. Fluorine reacts with uranium pentachloride at -40° according to the equation: $2\text{UCl}_5 + 5\text{F}_2 = \text{UF}_6 + 10\text{HCl} + 5\text{Cl}_2$. The two fluorides are separated by distillation. The course of the reaction suggests that uranium pentachloride is really a double compound, $\text{UCl}_4 \cdot \text{UCl}_2$. The pentachloride also reacts with dry hydrogen fluoride, forming a compound $\text{UF}_6 \cdot x\text{HF}$, which breaks up on distillation into UF_4 and UF_6 . The difficulty of separation of the volatile hexafluoride from hydrogen fluoride makes this method a less useful one. Uranium carbide, UC_2 , prepared at 2450° from uranium dioxide and carbon, yields only the tetrafluoride with pure fluorine, but in presence of chlorine at -70° it yields the hexafluoride.

Uranium hexafluoride, UF_6 , has the vapour density 11.7 (calc. 12.16) at 448° in a platinum vessel. The vapour pressure determined by Smith and Menzies' method (*Abstr.*, 1910, ii, 1037) has also been determined at various temperatures, using 0.1 gram substance for each determination. The boiling point is 56.2° , and the calculated mean latent heat of evaporation between 42° and 57° is 29.4 cal. per gram, or 10,360 cal. per gram-molecule. The compound forms glistening, colourless or pale yellow, monoclinic crystals, m. p. 69.2° (corr.), at which temperature it has a vapour pressure of two atmospheres. It has $D_{20}^{25} 4.68$.

Uranium hexafluoride is highly reactive, attacking glass if traces of water are present, and reacting vigorously with water, alcohol, ether or benzene, depositing carbon in the last case. It reacts more slowly with carbon disulphide, paraffin, chloroform, and nitrobenzene. The best solvent is tetrachloroethane. It also reacts with nitric oxide, ammonia, and arsenic trichloride. It is reduced by most non-metals and metals, except gold and platinum. Sulphur forms US_2 and UF_6 , together with a gas condensing at -40° and freezing at -135° , which appears to be a new sulphur fluoride. C. H. D.

Vanadium Bromides. OTTO RUFF and HERBERT LICKFETT (*Ber.*, 1911, 44, 2534—2538).—The methods of preparation of the following compounds are based on those worked out for the vanadium chloride (this vol., ii, 291).

If bromine vapour or, better still, a mixture of bromine and sulphur bromide vapour is passed over a mixture of vanadium pentoxide and sulphur at a red heat, the distillate does not consist of vanadyl tribromide, VOBr_3 (compare the corresponding chlorine compounds, *loc. cit.*), but of a product which, on being heated in a vacuum at 240° , leaves a residue of pure vanadyl dibromide, VOBr_2 , sulphur bromide and bromine distilling away. If the temperature of the residue is raised to 360° , the vanadyl dibromide partly sublimes and partly decomposes with evolution of bromine, leaving a violet residue consisting of the hitherto unknown vanadyl bromide, VOBr . If this compound is further heated in a vacuum to 480° , vanadium tribromide distils away, leaving a residue of vanadium trioxide.

vanadium tribromide is readily obtained by the action of bromine vapours on vanadium carbide, V_4C_3 , at a dark red heat.

Full details of the methods of preparation of the above compounds are given.

Vanadyl bromide, $VOBr$, crystallises in violet octahedra, and has D^{20}_D 1.9902. It is only very slightly soluble in water, acetic anhydride, ethyl acetate, and acetone. T. S. P.

Vanadium Fluorides. OTTO RUFF and HERRERT LICKFETT (*Ber.*, 1911, 44, 2539—2549).—By the action of fluorine on vanadium or on the vanadium chlorides, mixtures of vanadium fluorides were obtained which could not be separated readily. Satisfactory methods for the preparation of the various fluorides by the action of anhydrous hydrogen fluoride on the anhydrous chlorides and bromides have, however, been worked out.

When anhydrous hydrogen fluoride is passed over heated vanadium trichloride, a brown intermediate product is formed at 120—130°. At 310° the brown powder change to a green one, which still contains chlorine unless the passage of hydrogen fluoride is continued for six to eight hours and the temperature raised to a dark red heat. *Vanadium trifluoride*, VF_3 , is then left as a greenish-yellow powder, which is almost insoluble in water and the usual organic solvents. The melting point lies above 800°, and it sublimes at a bright red heat; D^{20}_D 3.5628.

Vanadium tetrafluoride, VF_4 , is produced by the action of anhydrous hydrogen fluoride on vanadium tetrachloride, the reaction being started at -28° and the temperature allowed to rise to 0° in the course of two hours. It is a brownish-yellow, loose powder, which is very hygroscopic, deliquescent in the air to a blue liquid; readily soluble in water (blue solution) and acetone (green solution); it has D^{20}_D 2.9749. Above 325°, it decomposes into vanadium pentafluoride and vanadium trifluoride.

Vanadyl difluoride, VOF_2 , is prepared by heating vanadyl dibromide in a current of anhydrous hydrogen fluoride, first at 150—200° and then at 600—700° for six hours. It is yellow in colour, slightly soluble in acetone, but insoluble in other solvents; D^{19}_D 3.3956.

Vanadyl trifluoride, VOF_3 , is prepared from vanadyl trichloride in a similar manner to that described for the preparation of vanadium tetrafluoride; it may also be obtained by heating vanadium trifluoride to a red heat in a current of oxygen. It forms yellowish-white crusts, and is very hygroscopic, deliquescent in the air to a brownish-yellow solution. At 132°, when heated in glass tubes, it decomposes, red vanadium pentoxide being deposited; it then melts at about 300° and boils at 486°. In a current of oxygen, it sublimes at 130°. It has D^{20}_D 2.4591.

Vanadium pentafluoride, VF_5 , is obtained as a pure white sublimate when the tetrafluoride is heated in a current of nitrogen, the temperature being gradually raised from 300° to 650°, and the latter temperature maintained for two and a-half hours. At the ordinary temperature, it possesses an appreciable vapour pressure, and in moist air becomes yellow, owing to the formation of oxyfluorides. It is readily soluble

in water, alcohol, chloroform, acetone, and light petroleum. When heated in sealed glass tubes it does not melt, even above 2000° ; but it readily attacks the walls of the tube. It has D₁₉ 2.1766, and b. p. $111.2^{\circ}/758$ mm. It is the only vanadium compound in which five halogen atoms are bound to one vanadium atom.

Special methods were devised for the estimation of the vanadium and fluorine in the above compounds.

T. S. P.

The Action of Calcium Fluoride on Vanadium Pentoxide. WILHELM PRANDTL and HERMANN MANZ (*Ber.*, 1911, 44, 2582—2585).—When a mixture of vanadium pentoxide and calcium fluoride is heated to a red heat in an open platinum crucible, some of the vanadium is volatilised, the amount depending on the ratio $\text{CaF}_2 : \text{V}_2\text{O}_5$. When the ratio is 1:1, the loss is from 12% to 15%, and it increases to 30% with the ratio 5:1. If the crucible is covered with a lid, or with another crucible, which is kept cool during the heating, the latter is afterwards found to be coated with shining needle-shaped crystals of vanadium pentoxide, which are dark brownish-red when hot, and yellow when cold. Their formation is probably due to the volatilisation of a volatile vanadium fluoride or oxyfluoride, which is decomposed by the oxygen and water vapour of the air. This is made probable by the fact that when the reacting mixture is heated in a platinum tube in a current of nitrogen, an almost colourless, deliquescent sublimate is obtained. Analyses of the sublimate did not lead to any satisfactory conclusions; it contained quadrivalent vanadium. When the mixture is heated in a glass tube, the latter is strongly attacked, silicon tetrafluoride being formed.

T. S. P.

Tantalum, Tungsten, and Hydrogen. ADOLF SIEVERTS and E. BERGNER (*Ber.*, 1911, 44, 2394—2402).—Using the method previously described (*Abstr.*, 1910, ii, 410, 851), the solubility of hydrogen in tantalum at varying temperatures up to 1330° has been measured. Under the same hydrogen pressure the solubility decreases with rise in temperature, and at a given temperature (above 450°) it is proportional to the square-root of the pressure. The solubility curve is very similar to that obtained with palladium and hydrogen, and quite different from the curves of copper, nickel, iron, cobalt, and platinum. With palladium and tantalum, the absorption is an exothermic process, whereas with the other metals it is endothermic. The order of solubility is much the same for tantalum and palladium.

When heated in hydrogen, tantalum wire undergoes a structural alteration, becoming brittle and crystalline (compare Pirani, *Abstr.* 1905, ii, 718), which properties it retains after the hydrogen has been extracted by heating in a vacuum.

Nitrogen reacts slowly with tantalum at temperatures above 900° , forming a nitride.

The solubility of hydrogen in tungsten is very small at temperatures up to 1500° , and the values obtained were not equilibrium values. Nitrogen does not react with tungsten, even at 1500° .

T. S. P.

Mineralogical Chemistry.

The Laws of Mineral Association from the Point of View of the Phase Rule. VICTOR M. GOLDSCHMIDT (*Zeitsch. anorg. Chem.*, 1911, 71, 313—322).—The phase rule may be applied to mineral associations in the form: The maximum number of solid minerals that can co-exist in a stable condition is equal to the number of independent components contained in them. The number can only be exceeded at certain definite temperatures or pressures, at which transformations occur. The rule is applied to a number of mineral associations, including cases in which the components may unite to form binary or ternary compounds. An application to crystalline hornblendes of the Christiania region, derived from clays and limestone by contact-metamorphosis, shows the usefulness of the rule in determining which associations are possible, the components in this case being CaO , MgO , Al_2O_3 , and SiO_2 , whilst fifteen distinct minerals are possible, four of which may co-exist. C. H. D.

Bismuth Ores. EDUARD PRIWOZNIK (*Osterr. Zeitsch. Berg. Hutw.*, 1910, 58, 713—716).—A bismuth ore for which the name *empeclite* is proposed contains S 19.10%, Bi 62.09%, and Cu 18.8%, with the empirical formula $\text{Cu}_3\text{Bi}_2\text{S}_4$ and D²⁵ 6.223; it forms rhombic crystals, isomorphous with copper glance, and is found at Freudenstadt, in the Black Forest, in Norway, and at Mognaczka in Hungary.

Wittichenite has the formula $\text{Bi}_2\text{Cu}_3\text{S}_6$, D 6.006, and is obtained from Wittichen, in the Black Forest. A third copper bismuth ore, $2\text{Cu}_3\text{Bi}_2\text{S}_6$, was described by Maderspach, but is not sufficiently characterised. F. M. G. M.

Hydrothermal Silicates. EMIL BAUR and F. BECKE (*Zeitsch. anorg. Chem.*, 1911, 72, 119—161).—For the preparation of aqueous solutions of silicates at temperatures approaching a red heat, steel cylinders may be employed without a platinum lining, as the steel is only slightly attacked. The cylinder, with walls 18 mm. thick and a capacity of 11 c.c., is closed by means of a steel screw, rendered tight by a soft copper ring. The cylinder is only one-third filled with liquid, and is heated vertically in an electric resistance furnace. Each charge is exposed for 12 to 16 hours to a constant temperature of 350° or 450°.

The action of superheated alkaline solutions on crystalline quartz, alumina, etc., is very slow, and it is necessary to use amorphous materials. A clear solution is not formed, but the amorphous mass is converted into microscopic crystals without external change of form. The products are identified microscopically. The following minerals have been obtained, starting from silica, alumina, lime, and potassium or sodium hydroxide: Quartz, opal, orthoclase, albite, oligoclase, potassium feldspar, analcite, potassium nepheline hydrate, andalusite, pyrophyllite, muscovite, stilbite, gyrolite, and sodium and potassium

pectolite. The results are shown graphically on a diagram obtained from the tetrahedral representation of the quaternary system by drawing two planes through a point within the tetrahedron, and parallel with one face, and uniting the two triangles obtained in a plane.

The potassium faujasite contains much zeolitic water. Calcium aluminium silicates are not obtained under the conditions of the experiment, however the composition of the mixtures used is varied. The mixtures richest in alkali always yield zeolites, not feldspar. Mixtures containing lime always yield pectolite. Lignite is not found under these conditions. Tridymite is also absent, and the modification of crystalline silica which occurs is always quartz. The andalusite obtained is possibly metastable, but transformation into sillimanite is not observed. It is probable that metastable phases are often present in zones of contact metamorphism.

C. H. B.

Composition of Nephelite. WALDEMAR T. SCHUBERT, *J. Washington Acad. Sci.*, 1911, 1, 109—112).—In the trichloric feldspars are the well-known isomorphous molecules, $\text{NaAlSi}_3\text{O}_8$ (calcic), $\text{Ca}_2\text{Al}_2\text{Si}_2\text{O}_8$ (anorthite), $\text{NaAlSi}_2\text{O}_6$ (carnegieite), and KAlSi_2O_6 (monoclinic); and there is a parallel series of monoclinic feldspars. These compounds also form an isomorphous series of hexagonal modifications, namely: $\text{NaAlSi}_2\text{O}_6$ (essential component of nephelite; prepared artificially) and KAlSi_2O_6 (kaliophilite), to which may be added in analogy, $\text{Ca}(\text{AlSiO}_4)_2$ and $\text{NaAlSi}_2\text{O}_6$. The composition of nephelite can be very simply explained by the isomorphous mixing of these molecules; thus the recent analyses of Foote and Bradley (*ibid.*, ii, 122) and of Morozewicz (*Abstr.*, 1908, ii, 201) correspond very closely with:

	Foote and Bradley.	Morozewicz.
$\text{NaAlSi}_2\text{O}_6$	70.4%	74.7%
KAlSi_2O_6	19.6%	19.7%
$\text{NaAlSi}_3\text{O}_8$	10.8%	5.6%

L. J. S.

Minerals and Rocks of the Composition MgSiO_3 - CaSiO_3 - FeSiO_3 . ROBERT B. SOSMAN (*J. Washington Acad. Sci.*, 1911, 1, 54—58).—The published analyses of pyroxenite rocks and pyroxene minerals recalculated to molecular percentages of the metasilicates and plotted on a triangle with MgSiO_3 , CaSiO_3 , and FeSiO_3 at the three corners, representing a three-component system. It is seen that the rock analyses all lie in a limited "eutectic field," with the rhombic pyroxenes on one side and the monoclinic pyroxenes on the other. The relations are in harmony with the experimental data of Allen and White (*Abstr.*, 1909, ii, 247).

L. J. S.

Physiological Chemistry.

Variations in the Response of Healthy Men to Dyspnoeic Conditions Produced by Breathing a Confined Volume of Air. THEODORE HUGH (Amer. J. Physiol., 1911, 28, 369—390).—By breathing a confined volume (30 litres) of air, dyspnoea sets in, and healthy men attempt to secure increased ventilation of the lungs by increasing the rate or depth (or both) of the respiratory efforts. As a rule, rate and depth vary inversely; increase of rate occurred in five out of twenty-five men. The employment of muscles of expiration is another variable factor. The facts described harmonise with the theory that the chief stimulus is the tension of carbon dioxide in the blood.

W. D. H.

Gaseous Metabolism in Anaphylactic Shock. FRITZ LÖRNING (Arch. exp. Path. Pharm., 1911, 66, 84—109).—In anaphylaxis, disturbances and lowering of heat production and oxidation processes are always found.

W. D. H.

Protein Cleavage Products in Expired Air. WOLFGANG WEICHARDT (Arch. Hygiene, 1911, 74, 185—193).—Tubercle bacilli pass into the expired air; it is therefore not improbable that decomposition products of bacilli, mucus, etc., do so also. By breathing into distilled water and evaporation of the water, a ponderable residue is obtained, which contains high molecular products of protein decomposition. Dissolved in normal salt solution, the biological test in mice in producing sensibilisation is obtained. Negative findings in mice in the same direction by Inaba are criticised.

W. D. H.

The Oxygen-transport Capacity of Blood Warmed to Different Temperatures. LEO VON LIEBERMANN and FRANZ WISSNER (Biochem. Zeitsch., 1911, 35, 363—367).—From experiments on the rate of production of the blue colour with guaiacum-turpentine mixture, the conclusion was drawn that blood heated to different temperatures up to 50° is not appreciably altered in respect to its capacity to act as transporter of oxygen. At 50°, however, there may be some difference in respect to the capacity of taking up oxygen from the air, owing to the formation of methæmoglobin.

S. B. S.

Chemical Studies in Blood Regeneration. ERNST MASING (Arch. exp. Path. Pharm., 1911, 66, 71—83).—In anæmic rabbits and geese, characteristic changes occur in the phosphorised constituents of the blood which are believed to be related to regeneration of that fluid. In rabbit's serum, the phosphorus in the alcohol-ether extract is increased, and the red corpuscles are richer in phosphatides than normal. The nucleic acid in the red corpuscles is higher than normal in both anæmic rabbits and geese. Richness in nucleic acid and phosphatides is a mark of young corpuscles.

W. D. H.

The Action of Choline on Blood-Pressure. EMIL ASCHERHANS and FRANZ MÜLLER (*Zeitsch. physiol. Chem.*, 1911, 74, 253—272).—Most observers agree that the typical action of choline is to lower blood-pressure, except in atropinised animals. Modrakowski and Popielski alone find that it raises arterial pressure, and attribute the results of others to impurities. The present research gives the results of choline injections under various conditions of narcosis, etc., and the outcome is that the typical action of choline is to lower pressure, and that the presence of impurities will not account for the differences observed. Some of the authors' preparation was sent to Popielski to test the matter, and he reported that it produced a rise of blood pressure. Unfortunately for Popielski, the specimen sent (by mistake) was an impure specimen, which, according to him, should have produced a fall of pressure. It did produce a fall of pressure in Berlin, and not did the pure specimens.

W. D. H.

Lactic Acid in Human Blood. H. FRIES (*Biochem. Zeitsch.*, 1911, 35, 368—385).—A method is described in detail for estimating lactic acid in blood, of which the essential processes consist in precipitating the proteins by mercuric chloride in acid solution, extracting the protein-free solution with ether, converting the lactic acid thus extracted into a zinc salt, oxidising the latter with permanganate, and estimating the aldehyde thus formed by Ripper's bisulphite method. As a result it was found that lactic acid often occurs in human blood, but the average amount is not increased in fever, and no conclusions can be drawn from the amount as to changes in the general metabolic processes. Lactic acid is increased after strenuous muscular work. Blood from the cadaver contains more lactic acid than that obtained from the living subject; the amount is the latter increases if it be incubated at 40° for two hours. There is no information available as to the origin of lactic acid in blood.

S. B. S.

The Fat of Dog's Blood under Normal and Various Experimental Conditions (Digestion, Hunger, and Phosphorus, Phloridzin and Chloroform Poisoning). LEONE LATTES (*Arch. exp. Path. Pharm.*, 1911, 66, 132—142).—In normal dogs the light petroleum extract (Kumawaga-Suto's method), which contains higher fatty acids and cholesterol, varies between 0.3% and 0.42% of the blood, and is higher in venous than in arterial blood. This is doubled during absorption of food rich in fat, especially milk. It is also increased by poisoning with phloridzin and with phosphorus, and slightly in the early stages of inanition. Chloroform narcosis has practically no effect.

W. D. H.

The Distribution of Reducing Substances in the Blood of Mammals. H. LYTTEKENS and J. SANDOREN (*Biochem. Zeitsch.*, 1911, 36, 261—265. Compare Abstr., 1910, ii, 785).—The blood-corpuscles of all the mammals investigated contain more or less the same amount of reducing substance, which is equivalent in reducing power to 0.05—0.08% dextrose, and varies slightly in the same species. It is

not dextrose, however, as the reducing power remains intact after fermentation. The blood-serum contains, in the same animals, a reducing substance which is not dextrose, in amounts varying between 0.033 and 0.045% of dextrose equivalent. The dextrose itself, however, varies largely in the different animals, being 0.222% for rabbits, 0.348% for guinea pigs, and 0.291% for cats, whereas for man, pig, sheep, ox, and horse, it varies between 0.063 and 0.095%. It is assumed that in the smaller animals the ratio of body surface to body weight is large, and therefore the combustion is more intense; hence the larger amount of dextrose in the blood stream. The authors reply to some criticisms of Michaelis and Rona on their methods, giving certain experimental facts in their support. S. B. S.

Enzymatic Decomposition of Hydrogen Peroxide. GEORGE SENTER (*Zeitsch. physiol. Chem.*, 1911, 74, 101—103. Compare Abstr., 1913, ii, 661).—Waentig and Steche (this vol., i, 759) state that the decomposition of hydrogen peroxide by the enzyme of blood is not in general a reaction of the first order, as found by Senter and by Euler. The author points out that the conclusions of Waentig and Steche can only be regarded as valid when it is shown that the enzyme does not undergo oxidation during the reaction. G. S.

Passage of the Internal Secretion of the Pancreas of the Fetus into the Blood of the Mother. ANTON J. CARLSON and FRED M. DRENNAN (*Amer. J. Physiol.*, 1911, 28, 391—395).—If a dog deprived of its pancreas becomes pregnant, or if a pregnant dog has its pancreas removed, pancreatic diabetes is lessened or prevented. This is due to the fetal pancreas, the secretion of which passes into the mother's blood; this effect is most noticeable in the second half of gestation, when the fetal pancreas is better developed and the Islands of Langerhans capable of playing their normal rôle. W. D. H.

The Presence in the Blood of the Pancreatic Internal Secretion. FRED M. DRENNAN (*Amer. J. Physiol.*, 1911, 28, 396—402).—Intravenous injections of fresh defibrinated blood from a normal dog into a dog deprived of its pancreas lowers the percentage of urinary sugar for a period of less than twenty-four hours. Control experiments show this must be due to the presence of the pancreatic internal secretion in normal blood. This is an unstable substance, and disappears when the blood is left a few hours. W. D. H.

Changes in Blood and Bone-Marrow Produced by Hæmorrhage and Blood-destruction. CECIL PRICE JONES (*J. Path. Bact.*, 1911, 16, 48—70).—After receiving 10 c.c. of a 1% solution of phenylhydrazine, the regeneration of red corpuscles in the rabbit is arrested or masked for at least six days. No such delay occurs after hæmorrhage. The cause of the delay is probably a toxic action on the bone-marrow. The type of regeneration is different in the two cases; the colour index is raised more by phenylhydrazine than by hæmorrhage, and the blood shows a higher grade of megalocytosis. W. D. H.

Hæmolysis by Ammonia. ED. STADLER and H. KLEINER (*Biochem. Zeitsch.*, 1911, 36, 301—320).—By means of direct titration it is shown that the amount of ammonia taken up by blood-corpuscles after washing with saline follows the laws of adsorption phenomena, and in this way the conclusions of Gros are confirmed, who arrived at the same result by the measurement of the amount of hæmolysis. The adsorption is much slower if the experiments be carried out in isotonic sucrose instead of sodium chloride solutions. This is not due to the difference in the amount of the ammonia taken up, which is the same in both cases. In the case of blood-corpuscles in sucrose solution, the rate of hæmolysis is not constant, but sets in rapidly after a period during which but little hæmolysis takes place. In the case of blood-corpuscles in saline, the hæmolysis is a regular process. In the former case, the formula which expresses the relationship between the concentration of the ammonia and the time necessary for complete hæmolysis does not correspond with the laws of adsorption. The inhibitory influence of serum and peptone solutions on hæmolysis may be at least partly explained by the diminished adsorption of ammonia. When large amounts of blood-corpuscles are employed, the increased amount of ammonia adsorbed is not proportional to the increased quantity of blood, but diminishes with increasing amounts of it. Blood which has been in i-tonic sucrose solution for twenty-four hours is more rapidly hæmolyzed (and adsorbs more ammonia) than fresh blood. S. R. S.

Hæmolysis by Acetic Acid. ED. STADLER and H. KLEINER (*Biochem. Zeitsch.*, 1911, 36, 321—334).—The methods of experiment and the results obtained were similar to those in the case of ammonia (see foregoing abstract). In the case of acetic acid, the inhibitory influence of serum is very great, possibly owing to the combination of the serum with the acid. S. R. S.

Hæmolytic Extracts of Organs. P. SCHÄFER (*Biochem. Zeitsch.*, 1911, 35, 445—470).—It has been shown that if hæmolytic soap solutions are heated with proteins, the hæmolytic substance will be carried down with the coagulum, which will then become hæmolytic, whilst the supernatant fluid will become inactive. It has been suggested that the hæmolytins in the organs are soaps, and it is now found that they act like soaps in respect to the action of proteins. Activated cobra venom acts also in the same way, although it cannot be carried down so completely by the proteins, and the protein-venom combination is less stable.

Experiments were also carried out with the hæmolytin obtained by extracting the pancreas with alcohol. No regular results were obtained, as sometimes the extract from fresh tissues was inactive, and only became active after autolysis, whereas in other cases the reverse was observed. Neither could any connexion be traced between the state of nutrition or the quality of the food (that is, whether the diet had been mainly protein, carbohydrate, or fat) on the hæmolytic power of the alcoholic pancreas extract; soap injected into the blood stream of an animal rapidly disappears, as the injection causes no

appreciable increase in the hæmolytic power of the serum removed short time after the injection. S. B. S.

Relation of the Reaction of the Culture Medium to the Production of Hæmolysin. E. E. ATKIN (*J. Hygiene*, 1911, 11, 193—201).—Bacteria differ greatly in their range of growth in medium of varying reactions. Roughly, the optimum of growth occurs when the reaction is neutral to phenolphthalein; but most micro-organisms have some power of overcoming the inhibitory effect of sodium hydroxide; the capacity to overcome the effect of hydrochloric acid is rarer. The production of hæmolysin by *Vibrio nasik* is not limited to an optimum reaction, but is coextensive with its range of growth in media of varying reactions, but the maximum is reached sooner and lost sooner in alkaline as compared to acid cultures.

W. D. H.

The Alterations in Hæmolytic Immune-substance which Occur During Immunisation. CARL H. BROWNING and G. HASWELL WILSON (*J. Hygiene*, 1911, 11, 208—219).—Rabbits were injected intraperitoneally with the red corpuscles of ox-blood; the immune-substance in the serum at an early stage is deficient in the power of causing absorption of complement; in later stages this is not the case.

W. D. H.

Effects of Ultra-violet Rays on Serum. W. M. SCOTT (*J. Path. Bact.*, 1911, 16, 148).—The exposure of anti-toxic serum to ultra-violet rays destroys the major part of the antitoxin, but leaves the ataphylactic toxicity still appreciable. The procedure also renders the serum incoagulable by heat, and markedly increases the amount of protein precipitable by half saturation with ammonium sulphate.

W. D. H.

A Reversed Action of the Chorda Tympani on Salivary Secretion. HENRY H. DALE and PATRICK P. LAIDLAW (*J. Physiol.*, 1911, 43, 196—198).—Several observers have noted the reversal of effects of stimulation of nerves after certain drugs. The present paper draws attention to the effect of cytisine, the alkaloid of laburnum seeds, which has an action similar to that of nicotine in reversing or lessening the usual action of stimulation of the chorda tympani nerve.

W. D. H.

Lecithin and Diastatic Action. EMILE F. TERBOINE (*Biochem. Zetsch.*, 1911, 35, 506).—In view of the recent investigations on this subject, the author reiterates his conclusions, namely: (1) Lecithin does not increase the rate of hydrolysis of monobutyrin by pancreatic juice, and increases only to a slight extent in more concentrated solution the rate of hydrolysis of oils. (2) It increases the lipolytic action of neither mucous membrane of stomach (in glycerol) nor intestinal lipase. (3) It has no action on the rate of hydrolysis of starch, the digestion of caseinogen or coagulated albumin, or the coagulation of milk by pancreatic juice.

S. B. S.

Physiology of Digestion. III. The Secretion of Gastric Juice when the Chlorine Supply of the Body is Lessened. KROEMER ROSEMAN (Pflüger's Archiv, 1911, 142, 208—234. Compare Abstr., 1907, ii, 706; 1910, ii, 1082).—Three experiments on dogs show that the secretion of gastric juice varies directly as the condition of nutrition in the animal; further, the supply of chlorine is most important, not only on the amount of acid in the juice, but for the secretion of the juice at all. The secretion commences again at giving chlorides. About 20% of the chlorine supply is the food available for gastric juice secretion.

W. D. H.

The Preparation of Solutions of Rennet Poor in, or Free from, Pepsin. OLOF HAMMARSTEN (Zeitsch. physiol. Chem., 1911, 74, 142—168).—A contribution to the vexed question of the identity or non-identity of the gastric enzymes. The main result of the research is that by precipitation of an acid infusion with caseinogen, the relation of the two enzymic actions is completely altered; the peptic is much more diminished than the rennetic. There can be no question here of the harmful action of reagents on the enzymes. The weakening of peptic activity cannot again be due to the appearance of inhibitory substances, but is only explicable on the assumption that the filtrate is poor in pepsin. From this it follows that the two enzymes are distinct, pepsin being precipitated with the caseinogen in greater proportion than rennin.

W. D. H.

The Specific Inhibition of Rennet, and Differences between Rennets. SVEN G. HEDIN (Zeitsch. physiol. Chem., 1911, 74, 242—252).—By warming neutral infusions of the gastric mucosa membrane of guinea-pig, calf, and pike with dilute ammonia and then neutralising, substances are formed which inhibit rennetic action. The inhibitory substances only inhibit the rennet of the animals used. The specific action of the inhibitory substances indicates that the enzymes they inhibit are specific also.

W. D. H.

Digestive and Absorptive Defects. I. E. S. LONDON, W. F. DAGAIEFF, B. D. STASSOFF, and O. J. HOLMBERG (Zeitsch. physiol. Chem., 1911, 74, 328—359).—After removal of the whole or part of the stomach, various motor disturbances in the rest of the alimentary canal are noted, which are described in detail. The disturbances of secretory activity vary in relation to the sort of food given. Among the points mentioned are: (1) that protein and not fat leaves the stomach first after partial removal, and (2) that the duodenum enlarges into a reservoir when the excision is complete. Resection of the ileum leads to increased activity of the upper portion of the tube both as regards digestion and absorption, whereas resection of the jejunum produces a compensatory action in the large intestine. Obliteration of the pancreatic vessels produces little or no effect on digestion, and the same is true for occlusion of the pancreatic ducts. Total removal of the pancreas appears to evoke no compensatory activity.

W. D. H.

Effects of Nutrition with Maize. III. Action of the Pancreatic Juice of the Dog on Zein and Gliadin. SILVESTRO *Rizzoni* (*Atti R. Accad. Lincei*, 1911, [v], 20, ii, 36—39. Compare *Abstr.*, 1910, ii, 625).—Zein and gliadin are digested by pancreatic juice in the same way as animal protein. The biuret reaction in the intermediate stage of the process shows the presence of peptones, and later of amino-acids. From comparative experiments in which the free amino-acids formed were estimated by Sørensen's method, it is shown that gliadin is more readily digested than zein. R. V. S.

The Detection of Active Pepsin in the Intestinal Contents by means of Elastin. EMIL ABDERHALDEN and OTTO MEYER (*Zeitsch. physiol. Chem.*, 1911, 74, 67—100).—By means of adsorption with elastin, pepsin is always discoverable in the small intestine in important amounts. Peptic digestion is not confined to the stomach; the individual parts played by pepsin, trypsin, and erepsin in this part of the alimentary canal in protein digestion have still to be cleared up. It is perhaps their joint action which leads to the rapid disintegration of proteins into their amino-acids. The pepsin is no doubt adsorbed by elastin and connective tissues in the stomach, and carried thus in an active condition into the intestine.

W. D. H.

The Use of Elastin for the Detection of Proteolytic Enzymes. EMIL ABDERHALDEN and KARL KIESEWETTER (*Zeitsch. physiol. Chem.*, 1911, 74, 411—426).—Elastin absorbs enzymes, as Grützer showed that fibrin does; its special value is that it itself only very slowly undergoes any cleavage. By its use, the following facts were determined: (1) The faces of ox, horse, dog, and man usually contain no digestive enzymes; (2) peptolytic enzymes were detected by the optical method and the biuret reaction in the following organs, or juices: horse liver, the juice from horse liver, the juice expressed from yeast, and horse's kidney. Some observations on the comparative digestibility of elastin, fresh egg-white, and boiled egg-white are given. The effects are not the same with the natural and artificial gastric juice.

W. D. H.

Chemistry of Digestion and Absorption in the Animal Body. XL. The Degree of Cleavage of Different Proteins in the Alimentary Canal. E. S. LONDON and A. G. RABINOWITZ (*Zeitsch. physiol. Chem.*, 1911, 74, 305—308).—Gastric digestion has only a limited power to cleave proteins into peptides; this power increases in the intestine. The amount of cleavage varies with different proteins, but there is no difference whether the proteins are obtained from the same species of animal or not.

W. D. H.

Chemistry of Digestion and Absorption in the Animal Body. XLI. The Digestion of a Mixed Diet in Dogs and Men. R. S. KAY (*Zeitsch. physiol. Chem.*, 1911, 74, 312—317).—In dogs, absorption of the chyme is most active at early stages of digestion, but it increases again a little at the end. Carbohydrates

are absorbed first, then nitrogenous substances, and fats most slowly. In man some few observations show that absorption is similar to that in the dog.

W. D. H.

A Reversible Phenomenon in the Action of Intestinal Juice on the Products of Casein Digestion. E. S. LONDON (*Zeitsch. physiol. Chem.*, 1911, 74, 301—304).—The intestinal chyme after feeding on casein is jelly-like; on removal from the body it becomes fluid in a few days under antiseptic conditions. The process is due to enzyme action, and is directly proportional in its velocity to the amount of intestinal juice; it runs parallel to the rate of formation of peptides, and is hastened by sodium carbonate. Its subsequent liquefaction is due, not to intestinal, but to other enzymes. The phenomenon is similar to plastein reactions.

W. D. H.

The Action of Intestinal Juice on the Digestive Products of Various Proteins. E. S. LONDON and S. K. SOLOWOFF (*Zeitsch. physiol. Chem.*, 1911, 74, 309—310).—No single protein was found to be entirely decomposed by intestinal juice into peptides; the amount of cleavage was least for elastin; casein, gliadin, horse-flesh, gelatin, and dog's plasma follow in the order named.

W. D. H.

The Specific Adaptation of the Digestive Juices. IV. The Relative Amount of Enzymes in the Intestinal Chyme on Different Diets. E. S. LONDON and R. S. KRYM (*Zeitsch. physiol. Chem.*, 1911, 74, 325—327).—No adaptation of the amount of enzymes to the amount of the kind of food given was found to occur in the intestine; indeed, lipase is in excess when pure protein food is given.

W. D. H.

Ereptase of the Intestinal Juice. GIUSEPPE AMATEA (*R. Accad. Lincei*, 1911, [v], 20, ii, 74—78).—The author has experimented with the secretion of isolated portions of the intestine of the dog produced with the aid of various mechanical and chemical stimuli. The juice is allowed to act on solutions of Witte's peptone or of Merck's casein, and the quantity of amino-acids formed is estimated by Sørensen's method. It appears that the secretion of the intestine proper does contain an ereptase. Differences can be observed between the activity of the secretions obtained with different stimuli, but they are not very marked, and the juice collected under the action of one and the same stimulus may exhibit considerable variation. The quantity of amino-acids produced is greater from peptone than from casein in almost all cases.

R. V. S.

The Laws of Digestion and Absorption. X. The Disappearance of a Solution of Dextrose from the Stomach. E. S. LONDON and W. F. DAGGEFF (*Zeitsch. physiol. Chem.*, 1911, 74, 318—321).—The emptying from the stomach of a 5% solution of dextrose follows the formula $x = k \sqrt{M/(t+p)}$, where p is $MX/1.4$ and k is 10.35. The stomach empties in from thirty to sixty minutes.

W. D. H.

The Laws of Digestion and Absorption. XI. Absorption of Proteins and Carbohydrates. E. S. LONDON and O. E. GABRILOVITCH (*Zeitsch. physiol. Chem.*, 1911, 74, 322—324).—The quantity of carbohydrate and protein absorbed is directly, and of water indirectly, proportional to the square-root of the quantity present, unless the concentration is abnormally great. The quantity of intestinal juice (A) which is secreted in dextrin-digestion varies directly with the square-root of the substance (M) dissolved: $N = k \sqrt{M}$; $k = 0.1755$.

W. D. H.

The Bleaching of Flour. J. M. HAMILL. Chemical Changes Produced in Flour by Bleaching. GORDON W. MONIER-WILLIAMS (*J. Hygiene*, 1911, 11, 142—166, 167—187).—These papers are abstracts of Local Government Board reports. The first is mainly technical, the second deals at greater length with the chemical changes produced, and the effect of bleaching on the digestibility of flour and bread. The digestibility of bleached flour is reduced. Salivary digestion was especially investigated.

W. D. H.

Carbohydrate Metabolism and Glycosuria. FREDERICK W. PATT and WILLIAM GODDEN (*J. Physiol.*, 1911, 43, 199—208).—Dextrose absorbed from the alimentary tract or intravenously injected in rabbits becomes fixed, and does not show itself either in blood or urine. This power of fixation is not unlimited, and is less when the sugar is injected rapidly, or when the amount of sodium chloride in the blood is increased. The fixing capacity, it is suggested, is due to bioplasmic incorporation carried out by lymphocytes, leucocytes, and growing bioplasm on other cells.

W. D. H.

Carbohydrate Metabolism. II. The Prevention and Inhibition of Pancreatic Diabetes. FRANK P. UNDERHILL and MORRIS S. FINE (*J. Biol. Chem.*, 1911, 10, 271—285. Compare this vol., ii, 910).—Removal of the pancreas from a dog may be followed by glycosuria within two hours. This is prevented by previous injections of hydrazine. The effect of a single hypodermic injection of 50 ug. of hydrazine sulphate per kilo. of body-weight may last two to four days. The amount of blood sugar in animals so treated and depancreatized is below the normal, or is at any rate not increased. If the injection is made during the course of pancreatic diabetes, the excretion of sugar in the urine is completely inhibited. After the administration of hydrazine, the presence of adrenaline in the adrenal bodies may still be demonstrated. In this respect hydrazine differs from phosphorus. The tentative hypothesis advanced can only be fully understood by the full presentment of it in the original paper; the underlying assumption, however, is that there exists an inter-relation between the pancreas, liver, and adrenals which normally keeps the amount of blood sugar constant. When the pancreas is removed, facilitation of carbohydrate katabolism is lost, and the opposing effect of the adrenals has full sway. Hydrazine, like phosphorus, is considered to diminish adrenal activity.

W. D. H.

The Importance of Lipoids in Nutrition. WILHELM STOTT (*Zeitsch. Biol.*, 1911, 57, 135—170).—If mice received food freed from lipoids by alcohol and ether, they died in a few weeks. This is not due to alteration in the saline constituents, or to the removal of fat. Fat added to the extracted food does not delay the fatal result; the addition of the alcohol-ether residue does. The important materials are lipoids, and are contained in the milk plasma. Lecithin and cholesterol alone are not the materials in question. Boiled milk supports life in mice as well as unboiled; but food free from lipoids plus boiled milk, killed half the mice used; if unboiled milk is used instead, health remains perfect.

W. D. H.

The Action of Some Non-protein Nitrogenous Compounds on Nitrogenous Metabolism of the Carnivora with Special Reference to Ammonium Acetate. ERNST PESCHECK (*Pflüger's Archiv*, 1911, 142, 143—207).—If ammonium acetate is added to the food of dogs, even in comparative small amount and for a short time, the nitrogen is utilised. If it is intravenously injected, it has a strongly stimulating action, leading to noteworthy loss of nitrogen from the body. Ammonium tartrate has a harmful effect on nitrogenous metabolism. Asparagine caused nitrogen retention, but in a second experiment on the same dog, this was not confirmed.

W. D. H.

The Value of Different Amino-acids in the Organism of the Dog under Different Circumstances. EMIL ABBENHAGEN, ALBERTO FURNO, ERICH GOEBEL, and PAUL STRÜBEL (*Zeitsch. physiol. Chem.*, 1911, 74, 481—504).—Knoop has shown that in the dog, β -benzylpyruvic acid is transformed into anilino-butyric acid. This opens up the possibility of the transformation of one amino-acid into another, and thus the elucidation of many metabolic problems. As a preliminary to further work on such lines, the effect on the urine of fasting dogs was investigated; the principal experiments recorded in the present paper deal with glutamic and aspartic acids, asparagine and histidine; these were given alone or in conjunction with sucrose or pyruvic acid. The results given in full tables are very inconstant; sometimes even with the same substance there was a fall, sometimes a rise, either in total nitrogen, ammonia-nitrogen, or amino-acid nitrogen of the urine. As a rule, there was no appreciable effect at all, and the changes where they do occur are very slight.

W. D. H.

Creatine and Creatinine. I. The Rôle of the Carbohydrates in Creatine-Creatinine Metabolism. LAFAYETTE B. MENDEL and WILLIAM C. ROSE (*J. Biol. Chem.*, 1911, 10, 213—264).—A carbohydrate diet, absolutely nitrogen- and fat-free, produces a marked reduction in the elimination of total nitrogen and creatine in fasting rabbits. If it is continued for two or three days, creatine disappears from the urine. Alcohol produces no decrease; a pure fat diet produces no decrease; and a diet of mixed fat and protein also causes no reduction in creatine elimination. An increase in the elimination of total

creatinine (that is, creatine plus creatinine) is always accompanied by an increase in the output of total nitrogen; it does not follow that the reverse is true; carbohydrates, in contrast to other foodstuffs, prevent the excretion of creatine, and are therefore indispensable for normal creatine-creatinine metabolism. The parallelism of total creatinine and total nitrogen output in inanition and with nitrogen-free diets is ascribed to a common source, namely, tissue or endogenous metabolism. The metabolism of exogenous or reserve protein is not accompanied by a production of creatine or creatinine. The intimate relation of creatine excretion (or the failure of its conversion into creatinine) to carbohydrate metabolism is discussed in full; experimental interference with the latter (such as phloridzin poisoning, which depletes the carbohydrate store, or phosphorus poisoning, which disturbs the glycogenic function) leads in dogs to an increased output of creatine.

W. D. H.

How far can Protein Katabolism in Inanition be Diminished by Feeding on Carbohydrates? W. WIMMER (*Zeitsch. Biol.*, 1911, 57, 185—236).—The experiments were performed on dogs, and it was found that feeding on carbohydrates can effect a sparing of protein to the extent of 55%; this is greater than the effect of gelatin. Starch and dextrose are about equal, provided the intake is divided into several meals per day. Pathological conditions appear to affect the result.

W. D. H.

Protein Metabolism in the Dog. CHARLES G. L. WOLF and EMIL OSTERBERG (*Biochem. Zeitsch.*, 1911, 35, 329—362).—The changes produced in the metabolism by giving quantities of protein, carbohydrate, and fat respectively insufficient for the body needs to a starving dog were investigated, the nitrogen and sulphur output and the distribution of these elements amongst various constituents by the urine being determined. It was found that the protein ingestion covers the sulphur lost by the body far more effectively than the nitrogen loss, and, in fact, in one case it was found that the body was retaining sulphur whilst losing nitrogen. The ratio of the amide- and urea-nitrogen to the total, tends to increase when protein is ingested; the ammonia-nitrogen remains more or less proportional to the total nitrogen. The creatinine-nitrogen is not affected, except that it appears to be somewhat less during the first period of protein ingestion than during starvation. The creatine appears on the third day of starvation, and disappears after ingestion of carbohydrates and proteins, but not of fat. The ratio of the residual nitrogen to the total diminishes after protein ingestion. The ratio of total sulphuric acid to total sulphur increases as the output of the latter increases in the urine; for example, after protein ingestion. The othercol sulphur is independent of the food, and has no relationship to the indican excreted. Carbohydrate ingestion after starvation decreases the amide- and urea-nitrogen ratio, but increases the ammonia-nitrogen ratio. Like proteins, carbohydrates cause a disappearance of creatine. They also cause an increase, both absolute and relative, of the residual nitrogen and sulphur. Ingestion of fat hardly alters the distribution

of the nitrogen, as compared with what exists during absolute starvation.

S. B. S.

Metabolism of Development. III. Qualitative Effects of Pregnancy on Protein Metabolism in the Dog. J. K. MURLIN (*Amer. J. Physiol.*, 1911, 28, 432-454).—In pregnancy, nitrogen is retained, and the urea and ammonia in the urine are relatively low, the nitrogen which would normally be excreted in these forms being re-synthesised to make good the depletion of the blood proteins caused by the product of conception. The creatinine, uric acid, and undetermined nitrogen show in consequence a relative increase. The same is true for sulphur; the inorganic sulphate in the urine is decreased, being held back for foetal development, and the "neutral sulphur" increased. On the days preceding parturition, creatine was found in the urine; this is indicative of tissue changes in the uterus.

W. D. H.

The Influence of the Various Components of Diet and of the Ingestion of Various Iron Preparations on Iron Metabolism. MARTIN KOCHMANN (*Biochem. Zeitsch.*, 1911, 36, 268-274).—The experiments were carried out on the same lines as the previous work of the author on calcium and magnesium metabolism. Dogs were fed on meat diets containing a known quantity of iron. The effect on the iron metabolism of increase of proteins, or of the addition of sugar and carbohydrates to the meat diet, was investigated. The addition of all these constituents of diet to the original diet appeared to exert an unfavourable influence, in that it increased the negative balance. The minimal quantity of iron necessary for iron equilibrium depends, therefore, on the quantity and character of the diet. The administration of ferratin, metaferrin, and ferric phosphate can influence the iron metabolism favourably, converting a negative into a positive balance, or increasing a positive balance where this previously existed. No marked difference can be definitely stated to exist in the action of the three iron preparations, although the organic preparations appear to exert a more favourable influence. S. B. S.

The Heat Production in the Vital Oxidative Processes of Eggs I.—III. OTTO MEYERHOF (*Biochem. Zeitsch.*, 1911, 35, 246-272, 280-315, 316-328).—In view of the study of the relationships between various morphological changes (membrane formation, bifurcation, etc.) produced in the eggs of sea urchins and other animals by both natural and artificial causes (fertilisation, treatment with narcotics, hypertonic solutions, etc.), and the amounts of oxygen utilised under different conditions, by Loeb and by Warburg (this vol., ii, 211), the author undertook the study of the amounts of heat produced under various conditions. The eggs were placed in a Dewar flask kept in a thermostat, and the heat changes during the vital process were measured by a Beckmann thermometer immersed in the vessel. Details are given as to the method of determining the calorimetric water value of the vessel, and of the various corrections to be applied, and the apparatus is figured. The oxygen used up was estimated in a second vessel kept

in as nearly as possible under the same conditions as the first, with addition of a known quantity of eggs, a modification of Winkler's method being employed for this purpose.

The nitrogen in the eggs was determined by Kjeldhal's method, and the results expressed in terms of calories developed per hour per 140 mg. of nitrogen. It was found that, in the case of sea-urchin's eggs after fertilisation, this was 4.0—4.2 calories in the first hour, and in the following hours, 4.5—5, 5.3—5.8, 6.0—6.5, and 7.8—9, etc. The stage of development of the eggs during this interval was also noticed. The heat produced in the consumption of 1 mg. oxygen ("caloric quotient" of oxygen respiration) was also determined. This was found in cases of normal fertilisation to be 2.65—2.75. This same quotient was also determined under various conditions of artificial membrane formation. The results obtained are discussed in some detail by the author. S. B. S.

The Lipoids of Egg-Yolk. CESARE SERONO and ANTOINETTO PALOZZI (*Chem. Zentr.*, 1911, ii, 772; from *Arch. farm. sperim.*, 1911, 11, 553—570).—One hundred grams of fresh yolk yield 14—17% egg oil, 11—12% lecithin, and 4% lutein. The last two were extracted with alcohol, and the first-named by extracting the alcoholic residuum with ether. The residue after extraction with alcohol and ether was free from fatty acids. The egg-oil has a yellow colour, and smells like olive oil; it solidifies at 15°; it is neutral, and does not show absorption bands or optical activity, and does not contain cholesterol. Various constants (iodine number, etc.) are similar to those of olive oil. It is easily saponified. It contains 68.68% triolein and 30.04% tripalmitin. Lutein and lecithin were separated by acetone, in which reagent the lecithin is insoluble. The lecithin yielded palmitic and oleic acids and choline. Lutein crystallises out from acetone in fine needles and plates, and in large, fluorescent lamellae. In the air it is rapidly oxidised by an oxydase in the yolk, and became reddish-yellow in colour. It is saponifiable with difficulty, and on decomposition yields free cholesterol and free fatty acids (cholesterol 39%, oleic acid 34%, and palmitic acid 9%). Lutein is regarded as an ethereal combination of cholesterol and fatty acids; glycerol was not detected. A synthetically prepared ester of similar composition was more resistant than lutein and less soluble in alcohol. W. D. H.

The Chemistry and Energy Dissipation in Sleeping Children. JOHN HOWLAND (*Zeitsch. physiol. Chem.*, 1911, 74, 1—12).—A calorimeter of the Benedict-Atwater type was used for observations on three children, three to seven months of age. Details are given of the diet, excretions, heat production, etc., in each, and these results are compared with those obtained from ill-nourished or feeble children. The law that heat production is proportional to the surface area of the body is true only for those who are well nourished. W. D. H.

Choline in Ox-Brain. MAX KAUFFMANN (*Zeitsch. physiol. Chem.*, 1911, 74, 175—178).—Gulewitsch felt doubtful whether the small amount of choline he obtained from ox-brain was free, or, more

probably, a decomposition product. If hydrolysis of lecithin or other phosphatide is prevented by the avoidance of hydrolytic agents, toline choline is discoverable.

W. D. H.

Cholesterol Obtained from the Skull Contents of an Egyptian Mummy. EMIL ABERHALDEN (*Zeitsch. physiol. Chem.*, 1911, 74, 392—393).—The brain-pan of an Egyptian mummy contained a brown, wax-like mass, from which a number of crystals had separated. These are identified as cholesterol.

E. F. A.

The Function of the Choroid Glands and its Relation to the Toxicity of Cerebro-spinal Fluid. S. P. KRAMER (*Brain*, 1911, 34, 39—44).—A normal saline extract of the choroid gland (choroid plexuses) injected into an anaesthetised animal intravenously causes a temporary fall of arterial pressure; no effect on the heart beat is noticeable. A similar effect obtained by the intravenous injection of certain specimens of cerebro-spinal fluid from pathological cases is attributed to excess of the choroid secretion.

W. D. H.

Swelling Capacity of Nerve Tissue. JULIUS BAUER (*Zeitsch. Chem. Ind. Kolloide*, 1911, 9, 112—116).—The influence of the addition of small quantities of hydrochloric, nitric, sulphuric, lactic, acetic, and boric acids to water on the swelling capacity of nerve tissue has been investigated. The data show that the swelling of nerve tissue of rabbits and cats is diminished by all six acids if the concentration is greater than 0.0005*N*. Similarly, the swelling of human brain tissue is decreased in all cases if the concentration of the acid is greater than 0.001*N*. These results show that acids have a dehydrating effect on the swelling of nerve tissue, as has been already found in the case of lipoids. Fischer's theory, according to which oedema is due to the increased swelling of tissue consequent on the formation of acid substances, cannot therefore be accepted in so far as brain and nerve tissue are concerned.

Salts diminish the swelling capacity of human brain tissue, and a similar influence is found in the case of non-electrolytes. In the case of very dilute acid solutions, the swelling is sometimes greater, sometimes less, than for pure water.

H. M. D.

Fat Removal in Peripheral Nerve-degeneration. W. KELMAN MACDONALD (*J. Path. Bact.*, 1911, 16, 71—74).—Nerve-degeneration was produced in rabbits by cutting the sciatic. The nerves were examined by the Marchi method. Six days after the operation, the fatty debris had not been carried beyond the confines of perineurium; five days later it had reached the septa between the nerve bundles. A few days later the amount inside the perineural sheaths was greatly lessened. Phagocytic and scavenger cells are the main agents in the transport.

W. D. H.

Qualitative Analysis of Tissue Lipoids. J. LORRAIN SMITH and W. MAIR (*J. Path. Bact.*, 1911, 16, 131—134).—The material is

fixed by formaldehyde, and methods are described for estimating the acidity of the chloroformic extract, the total alkali used in saponification, the cerebroside, the cholesterol both free and combined as esters, and phosphorus to indicate the amount of phosphatide. The method of saponification used (barium hydroxide) completely saponifies fat and lecithin, but leaves the cerebroside almost untouched. Contrasting the brain of the child and adult, it was proved that phosphatides are more abundant, and cholesterol and cerebroside less, in the child. In cases of hemiplegic softening, the cholesterol, especially that in ester form, is increased, but the cerebroside and the phosphorus are reduced. In cases of general paralysis, cholesterol is normal in amount, but cerebroside and, to a less extent, the phosphorus are reduced.

W. D. H.

The Influence of Lecithin on Absorption by the Skin. S. BORSCHUM (*Biochem. Zeitsch.*, 1911, 35, 471—477).—The hair was partly removed from rabbits, and the influence of lecithin in various preparations on the absorption of potassium iodide, eserine sulphate, tetanotoxin, and other substances, when rubbed into the hairless skin, was investigated, the urine being examined for these substances. Lecithin appears to promote very slightly the absorption of potassium iodide, but had no effect on the resorption of the other substances. The author used in a modified form Paolini's method for estimating colorimetrically the iodine in urine.

S. B. S.

The Significance of Oxygen for the Growth of Mammalian Tissue. LEO LOEB and MOYER S. FLEISCHER (*Biochem. Zeitsch.*, 1911, 35, 98—113).—The experiments were carried out by transplanting tissues to an artificial medium of blood-plasma, which was afterwards allowed to clot. The influence of oxygen on the formation of new tissue in this artificial medium was investigated.

A certain oxygen tension is necessary for growth under these conditions. In the complete absence of oxygen, the tissue dies, and it loses not only its capacity for growth, but also its phagocytic capacity. If the amount of oxygen ordinarily available is diminished, as, for example, by covering the tissue with the plasma coagulum, the growth of the cells and the number of surviving cells are diminished. Normal growths and carcinomata behave similarly, and no marked difference could be noticed between epithelial and connective tissue; the latter appears, however, to be somewhat more resistant when deprived of oxygen. Increase of oxygen tension in the atmosphere surrounding the plasma coagulum generally increases the peripheral surface of living tissue and also the processes of growth (mitoses).

S. B. S.

Creatine and Creatinine. II. Inanition and the Creatine Content of Muscle. LAFAYETTE B. MENDEL and WILLIAM C. ROSE (*J. Biol. Chem.*, 1911, 10, 255—264).—In the rabbit and fowl in inanition, an increase occurs in the percentage of creatine in their muscles, and there is no reasonable ground for doubting the origin of urinary creatine and creatinine in endogenous metabolism. Contrary

results reported by Howe and Hawk in the dog are severely criticised. The increase may be due (1) to a removal of the non-creatinine portion of the muscle, or (2) to an increased formation of creatinine. Reasons are given why the first is probably the correct view to take.
W. D. H.

Antipneumin. FR. BATELLI and MILE. LINA STERN (*Biochem. Zeitsch.*, 1911, 36, 114—143. Compare this vol., ii, 748).—Antipneumin is the substance which exists in many tissues, and has the capacity of diminishing primary respiration. It is precipitated with the nucleoprotein when an aqueous extract of the tissues is acidified with acetic acid (1 in 1500), and if the precipitate thus obtained is dried, a powder can be obtained containing antipneumin, which retains its specific action for a long period. Muscles and heart contain little, if any, antipneumin; the spleen is the richest in this substance. It is destroyed by heating to 65°, by moderate concentrations of acid and alkali, and by treatment with alcohol and acetone. It is not destroyed by peptic digestion, and is not dialysable. It is carried down generally with precipitates. It does not digest fibrin. Its action is inhibited by blood and by phosphates, and in investigating the content of any tissue in antipneumin, care must be taken to take into account the amount of phosphates present. Its inhibitory action on pnein is not immediate, but can only be detected after it has acted for some time. If tissue is allowed to remain in contact with an antipneumin solution and then washed, its respiratory capacity is not inhibited, and the antipneumin action appears therefore, at any rate after a short contact, to be reversible. There is no evidence that pnein and antipneumin are directly antagonistic. The action of the latter on primary respiration affects both the oxygen consumption and carbon dioxide output, so that there is little effect on the respiratory quotient. It has no action on the accessory respiratory processes (on the alcohol oxydase, urico-oxydase, or the oxidation of succinic acid). It inhibits the oxidation by the tissues, on the other hand, of citric acid (a primary oxidative process). It appears to regulate chiefly the post-mortal oxidative processes.
S. B. S.

The Magnitude of the Work of the Liver. OTTO POMOY (*Biochem. Zeitsch.*, 1911, 36, 342—343).—In reference to Verzar's paper with this title (this vol., ii, 746), the author claims that his own experiments (Abstr., 1910, ii, 785), carried out with a different technique, are of value in arriving at conclusions as to changes of respiratory quotient produced by throwing the liver out of general circulation.
S. B. S.

Inversion of Sucrose by Bees. A. KORNDORFER (*Chem. Zentr.*, 1911, ii, 777; from *Apoth. Zeit.*, 1911, 28, 659).—Two bees were transferred in the autumn to an empty honey-comb and fed with a 50% solution of sucrose. After half an hour, the sugar transferred to the comb was removed; it retained 42—44% of invert sugar. A single passage of the sugar solution through the honey sack of a bee suffices to invert 80% or more.
E. F. A.

Peptolytic Enzymes in Parasitic Worms. EMIL ABDERHALDEN (*Zeitsch. physiol. Chem.*, 1911, 74, 409—410).—Unless working under strictly comparable conditions the yield of tyrosine from silk-peptone is only a rough measure of the amount of peptolytic enzyme present. The intestinal contents of various intestinal worms gave wholly negative results by this and by the optical method. But if the worms were chopped up, the extracts showed the presence of peptolytic enzymes in large amounts, and the biggest yield was obtained from the intestinal walls of such worms.

W. D. H.

The Shield of Chelone Imbricata. HANS BUCHTALA (*Zeitsch. physiol. Chem.*, 1911, 74, 212—220).—Investigation of various epidermal horny appendages has shown great differences in their composition. The horny plate of the tortoise was subjected to hydrolysis and estimation of amino-acids with the following results. Glycine, 19.36; alanine, 2.35; valine, 5.23; leucine, 3.26; phenylalanine, 1.08; tyrosine, 13.59; cystine, 5.19, and glutamic acid, 0%. The high percentage of glycine and of tyrosine, the low percentage of leucine and cystine, and the absence of glutamic acid are remarkable. Of the total nitrogen, 94.84% is in the form of mono-amino-acids, 0.02% as melanin, 3.04% as ammonia, and 3.09% as diamino-acids.

W. D. H.

Experimental Glycosuria. VII. The Amount of Glycogenase in the Liver and in the Hepatic Blood as Affected by Stimulation of the Splanchnic Nerve. JOHN J. R. MACLEOD and R. G. PEARCE (*Amer. J. Physiol.*, 1911, 28, 403—421).—Stimulation of the great splanchnic nerve of the dog increases the reducing power of the blood issuing from the liver, but no increase in the glycogenolytic power of the liver-extracts. The blood issuing from the liver possesses the same glycogenolytic power before and during stimulation of the nerve. The conclusion is drawn that modifications in the glycogenolytic activity of the liver do not depend on changes in the amount of glycogenase, but on changes in the conditions under which a constant amount of this enzyme is acting.

W. D. H.

Isolation of the Individual Acids in Bile. FRITZ PREGL and HANS BUCHTALA (*Zeitsch. physiol. Chem.*, 1911, 74, 198—211).—The crude acids obtained by boiling ox bile with sodium hydroxide for twenty-four hours and then acidifying have been separated from each other by a modification of Langheld's process (*Abstr.*, 1908, ii, 211). The results in the main confirm those of Langheld, the acids being obtained in the following percentages (calculated on the quantity, 674 grams, of the dry, crude acids): fatty acids, 10.8; cholic acid, 51.2; deoxycholic acid, 13.5; choleic acid, 11.9; uncrystallised acids, 12.6. Contrary to the previous experience of the authors and of Langheld, it was found that, with this particular bile, sodium cholate did not crystallise from the boiling alcoholic solution.

In the course of the research it became evident that the presence of the fatty acids prevents the isolation of the specific bile acids by

any short process. However, by the following method, 50—70% of the specific bile acids can be obtained in a crystalline state directly from the aqueous solution of the bile after it has been boiled with sodium hydroxide (3.75 mols.) for twenty-four hours. The aqueous alkaline solution (after one extraction with ether to remove the cholesterol, if desired) is treated with ether, acetic acid (3 mols.) is added, and then hydrochloric acid (3.75 mols.) under stated conditions. The crystalline mass which separates consists essentially of cholic, choleic, deoxycholic, and a small quantity of the higher fatty acids, whilst the aqueous solution contains the greater portion of the fatty acids and of the deoxycholic acid. The crystalline mass is digested with alcohol, and is thus separated into a sparingly soluble residue containing cholic and choleic acids, and an alcoholic solution of deoxycholic and the fatty acids. The separation of the constituents of the several fractions does not present any difficulty.

Of the two preceding methods, the former is the more certain and more generally applicable; human bile has been examined by both processes, without success by the latter method, whilst by the former the crude acids have been almost entirely separated into the individual crystalline constituents.

C. S.

Compounds of the Aromatic Series as Chologogues M. PETROWA (*Zeitsch. physiol. Chem.*, 1911, 74, 429—435).—Sodium benzoate and salicylate, thymol, phenol, guaiacol, and menthol all cause a great increase in the secretion of bile, and all of them are excreted as ethereal sulphate. Thiocol (potassium *o*-guaiacol-sulphonate) has no such action; it is itself an aromatic sulphate, and therefore the liver can effect no further union with sulphuric acid.

W. D. H.

The Bile of the Hippopotamus. OLOF HAMMARSTEN (*Zeitsch. physiol. Chem.*, 1911, 74, 123—141).—Hippopotamus bile does not give the ordinary reactions for bile pigment; when freed from mucus it has a reddish-green colour. It contains two pigments, which give absorption spectra like that of cholehæmatin (found also in sheep and ox-bile). It contains 10.9% of salts soluble in water, but insoluble in alcohol; these are mainly chlorides; carbonates come next, with a small amount of sulphates and traces of phosphates. Of the material soluble in alcohol, 95.4% is precipitable by ether. It is poor in phosphatides, but contains a substance similar to jecorin. Cholesterol is absent, and the material soluble in ether, which is very scanty, is olein with a little solid fat. The bile is rich in glycocholic acid, and contains also taurocholates; about 6.4% of the sulphur is in ethereal sulphates. The cholic acid from the taurocholate is the usual kind; the glycocholic fraction yields a little cholic acid, but this is not quite certain; its chief acid is one not hitherto found, although it resembles hyocholic acid in some points; it contains 1.2% of sulphur.

W. D. H.

Colostrum Fat. SR. ENGEL and A. BODE (*Zeitsch. physiol. Chem.*, 1911, 74, 169—174).—The colostrum of cows has been collected immediately after calving, on the following day, and also at subsequent

intervals. The fat has been extracted and examined for the iodine number and also for the saponification number, Reichert-Meissl value, and Polenske value by Arnold's method. In agreement with previous observations, it is found that the iodine number, initially about 43, decreases as the period of lactation increases. The saponification number varies considerably (217.9—226.4 on the second day) in fats from different cows, but increases as the lactation period increases. The Reichert-Meissl value increases considerably (from 23.4 to 30.2) between the first and second day, then increases more slowly, and after about a week sinks to the normal value, 29.0. The Polenske value increases with the period of lactation, attaining the value for milk fat after the first week.

According to the preceding constants, the colostral fat of a cow distinctly shows the characteristics of a milk fat, but less pronouncedly. The transition of the colostral fat into milk fat is gradual, only the Reichert-Meissl values showing a marked increase from the first to the second day. The colostral and the milk fats exhibit slighter differences in the case of a goat than of a cow.

C. S.

Influence of Sodium Chloride on the Excretion of Bromides. CESARE PADERI (*Chem. Zentr.*, 1911, i, 1867; from *Arch. farm. speriment.*, 1911, 11, 196—213).—Dogs on a normal diet of cooked horse-flesh received 5 to 10 grams of sodium chloride and 2.5 to 5 grams of potassium bromide; the giving of the bromide increased the excretion of sodium chloride in the urine, and the elimination of bromide was increased by the administration of chloride. If the diet was free from chlorides, bromism was more readily induced than in normal animals, and bromides accumulated in the blood. The explanation is based on osmotic phenomena.

W. D. H.

The Amount of Alcohol Excreted by the Animal Organism under Various Conditions. II. Influence of Muscular Work on the Excretion of Alcohol in Expired Air and Urine. WILHELM VOLTZ and AUGUST BAUDREXEL (*Pflüger's Archiv*, 1911, 142, 47—88. Compare this vol., ii, 218).—A continuation of previous researches on the same subject. The factor specially investigated was the influence of muscular work; this increases the frequency of respiration, and it is this that leads to a greater amount of alcohol finding its way into the expired air than during repose. There is also a considerable increase in the amount of the ingested alcohol which leaves the body by the urine, although it still remains less than the amount expired. Full numerical details are given.

W. D. H.

Free Amino-acids in the Intestinal Contents of Certain Mammals. EMIL ABDERHALDEN (*Zetsch. physiol. Chem.*, 1911, 74, 436—444).—About one-fifth of the total nitrogen in the intestinal contents of dogs, pigs, oxen, and horses is contained in the form of free amino-acids. A few estimations are given of those which can be estimated by simple crystallisation; the ester method lead to great loss. In the case of dogs, the intestinal contents from 100 dogs were collected together; the estimation of amino-acid nitrogen works

out at about 0.1 gram per dog. The material has to be boiled to prevent further enzymic cleavage of polypeptides. W. D. H.

Creatine and Creatinine. III. Excretion of Creatine in Infancy and Childhood. WILLIAM C. ROSE (*J. Biol. Chem.*, 1911, 10, 265—270).—Creatinine excretion in young children is very low. The muscles of a new-born infant contain more creatine than embryonic muscles, but less than adult muscle. This coincides with Mellanby's statement that age is an important factor. It will account for the low creatinine excretion in infants, and furnishes further evidence for the origin of urinary creatinine in muscle metabolism. Creatine is usually present in the urine until the age of puberty. It is conceivable that the demand for carbohydrates by growing tissues is so great that the cells are left in partial carbohydrate hunger, and are thus unable to perform the "endo-katabolic" activities as perfectly as in later life. W. D. H.

Studies on Water-Drinking. IV. The Excretion of Chlorides when Large Amounts of Water are taken between Meals. S. A. RULON, jun., and PHILIP B. HAWK (*Chem. Zentr.*, 1911, i, 1867; from *Arch. intern. Med.*, 7, 536—550).—The investigations were performed on healthy young men in nitrogenous equilibrium. In two cases the urinary chloride increased on the day the water was taken, and then returned to normal; this is explained on the supposition that the secretion of gastric juice was increased, and the excess of hydrochloric acid was absorbed and excreted as ammonium chloride; the water would also stimulate protein katabolism in the tissues. In one case the increase of chlorides in the urine occurred on the day after the excess of water was taken; here it is considered that the diluted blood would seek to recoup its chlorides from the tissues, and that with the fall in intake of water, these would be excreted. W. D. H.

Fasting Studies. IV. (Studies on Water-Drinking. VII.) Allantoin and Purine Excretion of Fasting Dogs. S. R. WREATH and PHILIP B. HAWK (*J. Amer. Chem. Soc.*, 1911, 33, 1601—1632).—A study has been made of the allantoin-nitrogen and purine-nitrogen excretion of three adult dogs which were subjected to fasts of from forty-eight to ninety-six days and of a pup which was subjected to a seven-days' fast. The data obtained for the allantoin-nitrogen excretion show considerable variations, which appear to be functions of the age and development of the animals. A decreased excretion of purine-nitrogen was observed in all cases. The effect of a large increase in the ingestion of water during the fast produced a marked increase in the output of allantoin-nitrogen and a much more pronounced decrease in that of the purine-nitrogen. The sum of the allantoin- and purine-nitrogen excreted was higher during the four days in which large quantities of water were ingested than during any other four-day period of the fast, and this indicates that the water stimulated protein katabolism. E. G.

The Excretion of Quinine by the Dog, and a New Method for the Estimation of this Alkaloid. JULIUS KATZ (*Biochem. Zeitsch.*, 1911, 36, 144—189).—In quinine salts the acid can be estimated quantitatively by titration with alcoholic potassium hydroxide solution, using Poirrier's blue as indicator. This method can also be applied to estimation of other cinchona alkaloids. If an alcoholic solution of quinine is evaporated with hydrochloric acid on a water-bath in presence of sodium chloride, the salt

can be obtained free from excess of hydrochloric acid and the mono-acid salt. To obtain quinine from urine, the latter is treated with half its weight of ammonium sulphate and extracted with a mixture of 1 part of chloroform and 3 parts of ether. The extract can be cleared with magnesia usta.

The dog excretes in the urine smaller amounts of quinine than does the human subject; only a small part remains unabsorbed in the faeces. The quinine excretion ceases the fourth day after ingestion. The amount excreted is less when the quinine is administered subcutaneously, and still less when given intramuscularly, than after ingestion *per os*. After administration of aristochin, the excretion (of quinine) is at first smaller than after quinine, but with continued administration, increases; the excretion also continues for a much longer period after the ingestion of the drug has ceased. Subcutaneous and intramuscular injections of quinine cause vomiting.

S. B. S.

The Iron in the Urine of Domestic Animals. MAX REICH (*Biochem. Zeitsch.*, 1911, 36, 209—239).—The estimation was carried out by means of a slightly modified Neumann method. The normal urines were found to contain on an average 1 mg. iron per kilo., somewhat about the same amount as is found in human urine. There was not much difference in the iron content whether the animals were fed on an iron-rich or iron-poor diet in the cases of dog, pig, and sheep. The iron is present as an inorganic ferric compound in the colloidal state, and can be precipitated from the urine by calcium chloride.

S. B. S.

Purine Metabolism in Diseases of the Liver. S. LA FRANCA (*Biochem. Zeitsch.*, 1911, 35, 434—444).—Patients with liver cirrhosis were fed on diets free from purines, or containing known amounts of purines (or caffeine), and the amounts of uric acid and purine nitrogen excreted in the urine were determined under these two conditions. It was found in Laennec's atrophic cirrhosis, that the purine destruction in the body was defective, whereas in Hanot's hypertrophic cirrhosis the purine destruction was more or less normal.

S. B. S.

Auto-intoxication and Nephritis in Rabbits. W. HENWOOD HARVEY (*J. Path. Bact.*, 1911, 16, 95—104).—That products of protein decomposition (*p*-hydroxyphenylethylamine and the like) when formed in excess in the alimentary canal and absorbed may be factors in the production of renal disease is confirmed by the present experiments on rabbits. Nephritis was produced in the majority of the animals

dosed with such substances, either given by the mouth or intravenously injected over considerable periods. Many also developed degenerative changes in the aorta.

W. D. H.

The Action of Cholesterol Derivatives with Lecithin in the Syphilis Reaction. CARL H. BROWNING and J. CRICKENHALL (*J. Path. Bact.*, 1911, 16, 135—136).—The addition of cholesterol to lecithin increases the amount of complement absorbed in the presence of syphilitic serum. A large number of cholesterol derivatives were investigated, but none was found equal to cholesterol itself.

W. D. H.

Pharmacological Behaviour of Certain Insoluble Preparations of Mercury. I. EDUARDO FILIPPI (*Arch. farm. exper.*, 1911, 11, 457—474; Reprint).—The action of mercury compounds (HgCl_2 , HgI_2 , HgO , and mercury salicylate) was studied by digesting them with various organs *in vitro*, at 38° ; fifteen hours later, after filtration and centrifugalising, the organic substance was destroyed and the mercury estimated electrolytically. The amount of mercury per 100 grams of organ (liver, spleen, muscle, kidney, etc.) varied between 0.02 and 0.2. Mercury sulphide does not go into solution. The mercury which is dissolved from the other compounds is in part dialysable and precipitable by hydrogen sulphide, in part dissolved in a colloidal state, and in part firmly united to organic substances. The latter compounds increase in amount with more lengthy (eight days) digestion at the cost of the other portions.

W. D. H.

The Influence of Potassium Iodide on the Accumulation of Mercury in the Liver. FERDINAND BLUMENTHAL and KURT OFFENHEIM (*Biochem. Zeitsch.*, 1911, 36, 291—300).—Mercury was estimated by Salkowski's method, the tissues being partly destroyed by potassium chlorate and hydrochloric acid. From an aqueous extract of the residue the mercury was deposited on copper, from which it was expelled by heating in a test-tube. The condensed metal was rendered visible by converting it into the iodide with iodine vapour. The experiments were carried out on rats and rabbits with a variety of mercury compounds (nitromercuribenzoate, diamercuribenzoate, mercuric chloride, asurol, etc.). It was found that the liver was the only organ in which the mercury was constantly found. It was also observed that the rate of excretion after subcutaneous injection of compounds easily soluble in water was not always more rapid than in the case of those compounds which are only slightly soluble. If potassium iodide is administered simultaneously with the mercury compounds, the deposition of mercury in the liver was inhibited.

S. B. S.

The Behaviour of Ethylene Glycol, Propylene Glycol and Glycerol in the Animal Body. SOICHIRO MIURA (*Biochem. Zeitsch.*, 1911, 36, 25—31).—When glycerol or ethylene glycol is given to animals either by the mouth or subcutaneously, no derivatives of

glycuronic acid or other reducing substances are found in the urine. Propylene glycol, on the other hand, is excreted as a derivative of glycuronic acid, which may be isolated from the urine as barium propyleneglycolmonoglycuronate.
W. J. Y.

The Action of Intravenous Injections of Concentrated Solutions of Sugar and Salt. G. G. WILENKO (*Arch. exp. Path. Pharm.*, 1911, 63, 143—159).—Intravenous injection of concentrated salt solution in rabbits causes hyperglycæmia by stimulation of the central nervous system. The nerve stimulus is the cation. Another effect is first an increased and then a lessened permeability of the kidneys for sugar. This is determined by osmotic factors. The effect of concentrated solutions of dextrose on the kidney is the same, but less well marked.
W. D. H.

The Behaviour of *o*-Iodoanisole in the Organism. RICCARDO LIZZATO and G. SATTA (*Arch. farm. experim.*, 1911, 11, 393—404; Reprint).—Doses of 5—6 grams of *o*-iodoanisole in dogs cause local excitation, but no toxic effects. It is excreted in part unchanged in the faeces; about 40% appears in the urine; a small fraction of the iodine is there in inorganic union; the greater part is present as ethereal derivatives, probably as esters of *o*-iodoquinol monomethyl ether (35% being present as sulphate and 65% as glycuronate).
W. D. H.

The Behaviour of Iodo-fat Derivatives of Cholesterol in the Dog's Body. EMIL ABDERHALDEN and EMIL GRESSEL (*Zeitsch. physiol. Chem.*, 1911, 74, 472—480).— α -Iodopropionylcholesterol crystallises in tufts of needles, m. p. 115°; β -iodopropionylcholesterol crystallises in plates, m. p. 100°; di-iodolaidylcholesterol, m. p. 90°, was not obtained in crystalline form. All three are badly absorbed, two-thirds of the iodine given being recovered in the faeces. Iodine passes into the urine for four or five days after the administration, and a considerable fraction of what is absorbed remains in the tissues.
W. D. H.

Behaviour of Some Aliphatic Iodo-acids in the Organism. GIACOMO PONZIO (*Gazzetta*, 1911, 41, i, 781—787. Compare Abstr., 1904, i, 548; 1905, i, 405).—In view of the use of calcium iodohebenate as a drug, the author has investigated the physiological action of some salts and amides of aliphatic iodo-acids formerly prepared by him. Calcium α -iodopalmitate, $\text{Ca}(\text{C}_{15}\text{H}_{31}\text{O}_2\text{I})_2$, is an amorphous powder. α -Iodopalmitamide, $\text{C}_{15}\text{H}_{31}\text{ON}_2\text{I}$, is prepared: (1) from ammonia and 2-iodopalmityl chloride (obtained with phosphorus pentachloride); (2) from α -bromopalmitamide by heating it for some hours with an alcoholic solution of potassium iodide. The substance crystallises in large, lustrous laminae, m. p. 108°. α -Bromopalmitamide crystallises in small, colourless plates, m. p. 85°.

Calcium α -iodostearate, $\text{Ca}(\text{C}_{17}\text{H}_{33}\text{O}_2\text{I})_2$, is an amorphous powder. α -Iodostearamide, $\text{C}_{17}\text{H}_{33}\text{ON}_2\text{I}$, crystallises in large, lustrous laminae, m. p. 112°. α -Bromostearamide, $\text{C}_{17}\text{H}_{33}\text{ONBr}$, crystallises in small, colourless plates, m. p. 91°.

The administration of the calcium salts is well supported by the organism, and they are absorbed, the iodine being liberated in the urine, but the amides pass through the gastrointestinal canal for the most part unchanged.

R. V. S.

The Behaviour of Stereoisomeric Tartaric Acids in the Dog's Organism. CARL NEUBERG and SUMIO SANEYOSHI (*Biochem. Zeitsch.*, 1911, 36, 32—36).—When dogs were fed with either *d*- or *l*-tartaric acid, the same percentage of the total acid reappeared unchanged in the urine, whilst when racemic acid was given, the acid found in the urine was still optically inactive. There is thus no evidence that *l*-tartaric acid is used up in the body more quickly than *d*-tartaric acid (compare Brion, *Abstr.*, 1898, ii, 618).

W. J. Y.

The Method of Action of Phenylcinchonic Acid on the Purine Metabolism of the Dog. KONRAD FROMHERZ (*Biochem. Zeitsch.*, 1911, 36, 494—502).—The influence of the administration of atophan (phenylcinchonic acid) on the allantoin, uric and phosphoric acid excretions of dogs in different circumstances of nutrition was investigated. Somewhat varying effects were obtained. The author believes that the most probable action of the drug is the increase of the capacity of the kidneys for excreting the degradation products of nucleic acid. When this capacity has already reached its maximum, the action of the drug would naturally have no effect.

S. B. S.

The Influence of Saponin on the Physiological Action of Digitoxin. J. J. POSTOLÉFF (*Biochem. Zeitsch.*, 1911, 36, 335—341).—The investigation was undertaken with the object of determining whether saponins increase the toxic action of digitoxin, Straub's method of perfusion through the frog's heart being employed. To produce the death of the heart, within a half hour, it was found that doses of 0.025 mg. and upwards were necessary. If 0.02 mg. saponin be present in the Ringer's solution (2 c.c.), then a dose of only 0.02 mg. digitoxin was capable of producing death (cessation of ventricular beat) within this period.

S. B. S.

The Action of Crystalline Aconitine on the Isolated Frog's Heart. CURT HARTUNG (*Arch. exp. Path. Pharm.*, 1911, 66, 1—57).—A detailed experimental study of the action of aconitine on the frog's heart. The effect is a depressant one, first the ventricular and then the auricular beats being extinguished. The heart-muscle is paralysed.

W. D. H.

The Action of Crystalline Aconitine on the Motor Nerve and Skeletal Muscles of Cold-blooded Animals. CURT HARTUNG (*Arch. exp. Path. Pharm.*, 1911, 66, 58—70).—The effect of aconitine on nerves is first stimulating (unless the solution is very dilute) then paralyzing. The question whether the drug acts also on the motor endings of the nerve in muscle is discussed.

W. D. H.

Adrenaline Immunity. N. WATERMAN (*Zeitsch. physiol. Chem.*, 1911, 74, 273—281).—Various explanations of the so-called adrenaline immunity are discussed, such as a change in the substance in the

sympathetic junction on which adrenaline acts, a paralysis of the autonomic nervous system, and the relationship between adrenaline administration and an increase of the blood-sugar. No very definite conclusion is reached.

W. D. H.

Influence of Caffeine on the Ureopoeitic System of the Liver. GIOVANNI BATTISTA ZANDA (*Chem. Zentr.*, 1911, i, 1603; from *Arch. farm. speriment.*, 11, 125—135).—Diuretin and caffeine increase the sugar and urea in the blood, and the urea in the liver. This increase may explain the diuretic power of these drugs.

W. D. H.

The Influence of Substances of the Digitalin Group on Blood-pressure in the Rabbit. HERNANDO (*Arch. exp. Path. Pharm.*, 1911, 63, 118—131).—The rise of pressure produced by strophanthidin and belladonna is variable, but is especially small in chloralised animals. If the pressure is first lowered by bleeding, the rise is more pronounced. The effect is mainly of cardiac origin, and chloral lessens the excitability of cardiac muscle.

W. D. H.

The Action of Morphine, Codeine, Dionine, and Heroine, on Breathing. B. VON ISSEKUTZ (*Pflüger's Archiv*, 1911, 142, 255—272).—From experiments on rabbits, the conclusion is drawn that there is no qualitative difference in the action of the four drugs mentioned in the title on respiration. All of them lessen the number of inspirations, also their volume and energy, if the animal to start with is breathing normally. If, however, the breathing is superficial, these drugs increase the volume and the energy of the respiratory act.

W. D. H.

The Influence of Tetrahydro- β -naphthylamine on Temperature and Respiratory Exchange. N. METCH and MARCUS S. PERREY (*J. Physiol.*, 1911, 43, 109—129).—This compound causes rapid respiration, convulsions, excitation of sympathetic nerves, and other symptoms which may end fatally. Particular attention was paid to the rise of temperature which occurs, and is due to increase of muscular action produced by action on the central nervous system. This is antagonised by anaesthetics.

W. D. H.

Action of β -Iminazolyethylamine [4- β -Aminoethylglyoxaline]. HENRY H. DALE and PATRICK P. LAIDLAW (*J. Physiol.*, 1911, 43, 182—195).—This compound produces a vaso-dilator fall of blood pressure in carnivora, monkey, and fowl. This is a direct effect of the base. It slightly retards blood coagulation, accelerates the flow of lymph in the thoracic duct, and lowers body temperature.

W. D. H.

Biochemical Investigation of Aromatic Mercury Compounds. FERDINAND BLUMENTHAL (*Biochem. Zeitsch.*, 1911, 35, 503—505. Compare this vol., ii, 577).—A reply to Schrauth and Schoeller (this vol., ii, 687).

S. B. S.

The Mechanism of Antagonistic Salt Action. JACQUES LOEB (*Biochem. Zeitsch.*, 1911, 36, 275—279).—The author recapitulates several of his recently published results on the toxic action of sodium chloride on marine organisms, all of which show that the toxic action ceases to exist when potassium chloride and calcium chloride are present in the same relative proportions as they exist in blood and sea-water. He gives reasons for showing that this combination of salts is no mere nutrient medium, but ascribes their combined action to their effect on the colloids. The three salts in the proper relative proportions so act on the colloids (of the egg membrane, etc.) that these have just the correct permeability for salts and other substances which is necessary for the maintenance of the correct vital conditions. As the proteins alter in presence of different cations and anions (Pauli) as regards their physical character, the salts being quantitatively different in their actions in this respect, no other combination can be substituted for the combination of the chlorides of sodium, potassium, and calcium as they exist in sea-water. S. B. S.

Nerve Excitability in Oxalate Poisoning. RICHARD CHARIK and ALFRED FRÖHLICH (*Arch. exp. Path. Pharm.*, 1911, 66, 110—115).—The excitability of the vagus to faradic stimulation is lowered, and its susceptibility to atropine is increased, in oxalate poisoning. Calcium chloride in cases of slight poisoning by oxalates antagonises these effects. The excitability of autonomic nerves is affected in the same way, although the movements of the small intestine are unaffected. W. D. H.

Chemistry of Vegetable Physiology and Agriculture.

The Optional Forms of Lactic Acid Produced by Pure Cultures of *Bacillus Bulgaricus*. JAMES N. CURRIE (*J. Biol. Chem.*, 1911, 10, 201—211).—Various strains of this bacillus from different sources in pure cultures produce different varieties of lactic acid. The *d*-lactic acid strain predominates. In some cases inactive lactic acid is formed, which probably necessitates the presence of both dextro- and levo-acid-producing enzymes in the same organism. The bacilli of *B. Bulgaricus* type in human faeces and human saliva are identical. Some strains produce small amounts of succinic acid which may account for the presence of this acid in Cheddar cheese. W. D. H.

The Influence of Strychnine on Bacteria. WL. S. SADIKOFF (*Centr. Bakt. Par.*, 1911, i, 60, 417—425).—Experiments showed that certain bacteria were able to grow in bouillon to which had been added 0.2—5.0% of strychnine phosphate, sulphate or chloride. The organisms were found to be more sensitive when grown on strychnine agar, but *Proteus*, *Bacillus subtilis*, *B. mesentericus*, *B. coli*, and *B. typhi*

unable to grow in the presence of 0.5% of the phosphate. *Staphylococcus aureus* and some moulds were more resistant; the former organism becomes non-chromogenic when strychnine chloride is used instead of the phosphate. In like manner, the secretion of tryptase, invertase, and maltase is checked, or the enzymes are destroyed.

The non-toxic behaviour of these salts is believed to be due to the deposition of free strychnine by ammonia and basic amides formed in the cultures.

H. B. H.

Action of Gypsum on Nitrification. SERAFINO DEZANI (*Chem. Zentr.*, 1911, ii, 157; from *Staz. sper. agrar. ital.*, 1911, 44, 119—137).—Soil (1—2 grams) with magnesium carbonate (2 grams), a solution of an ammonium salt (200 c.c.), and gypsum (0.5 to 2.0%), both with and without organic matter, was inoculated with *B. Nitrosomonas* and with *B. Nitromonas* respectively, and the ammonia, nitrites, and nitrates estimated from time to time. Similar experiments were made with an artificial soil and with soil (500 grams). Nitrification was not materially increased by the presence of gypsum.

N. H. J. M.

Sugar Tests and Pathogenicity in the Differentiation of Streptococci. J. M. BEATTIE and A. G. YATES (*J. Path. Bact.*, 1911, 16, 137—138).—Forty-two strains were investigated. Gordon's tests do not differentiate those which are pathogenic and those which are not.

W. D. H.

Fixation of Nitrogen by Yeasts and other Fungi. CHARLES B. LIPMAN (*J. Biol. Chem.*, 1911, 10, 169—182).—Eighteen organisms, yeasts, pseudo-yeasts, and moulds were found to show a more or less pronounced power of fixing atmospheric nitrogen. The highest amount fixed was 2.94 mg. per gram of mannitol by pseudo-yeast Tulare No. 46b in solution of mannitol in distilled water. *Aspergillus niger* and *Penicillium glaucum* fix nitrogen as stated by previous observers. *Botrytis cinerea*, a parasitic fungus, has the same power.

W. D. H.

Fermentations with Yeast in Absence of Sugar. III. CARL NEUBERG and LÁSZLÓ KARCZAG (*Biochem. Zeitsch.*, 1911, 36, 60—68).—In earlier communications (this vol., ii, 320, 520) it was shown that a number of substances other than sugars give off carbon dioxide when treated with yeast.

In the cases of pyruvic, *d*-tartaric, and glycerophosphoric acids, it is now found that this evolution of carbon dioxide in presence of yeast is accompanied by a considerable disappearance of the substance. The other products of the fermentation have also been isolated in the cases of pyruvic and oxalacetic acid (next abstract).

The carbon dioxide is therefore due to a true fermentation of the substance, and not to an increase in the auto-fermentation of the yeast, as was obtained by Hardon and Paine (*Proc.*, 1911, 27, 103) by the addition to yeast of a molar solution of sodium chloride or ammonium sulphate. On the other hand, the authors were only able

to repeat the results obtained by Harden and Paine on rare occasions, neutral salts, as a rule, producing on the contrary an inhibition of the auto-fermentation. This difference in behaviour is ascribed to the difference between English and German yeasts.

W. J. Y.

Fermentations with Yeast in Absence of Sugar. IV. A New Enzyme in Yeast-Carboxylase. CARL NEUBERG and LÁSZLÓ KARCZAG (*Biochem. Zeitsch.*, 1911, 36, 68—75).—Free pyruvic acid and oxalacetic acid in solutions of 1% are fermented by yeast with production of carbon dioxide and acetaldehyde: $\text{CH}_3\cdot\text{CO}\cdot\text{CO}_2\text{H} = \text{CO}_2 + \text{CH}_3\cdot\text{CHO}$; $\text{CO}_2\text{H}\cdot\text{CH}_2\cdot\text{CO}\cdot\text{CO}_2\text{H} = 2\text{CO}_2 + \text{CH}_3\cdot\text{CHO}$. The acetaldehyde may be detected by distilling the mixture and isolating from the distillate by means of the *p*-nitrophenylhydrazones. These decompositions are not brought about when yeast which has previously been heated is employed, but are found to occur with yeasts which have been killed with acetone, toluene, etc. It is therefore due to an enzyme to which the name *carboxylase* is given.

When potassium pyruvate is fermented, the reaction goes somewhat differently, potassium carbonate being formed: $2\text{CH}_3\cdot\text{CO}\cdot\text{CO}_2\text{K} + \text{H}_2\text{O} = 2\text{CH}_3\cdot\text{CHO} + \text{CO}_2 + \text{K}_2\text{CO}_3$. In this case some of the carbon dioxide will be held in solution, forming potassium hydrogen carbonate, and the aldehyde will be polymerised in presence of alkali. The fermentation of potassium pyruvate is therefore more difficult to demonstrate.

W. J. Y.

Fermentations with Yeast in Absence of Sugar. V. Carboxylase. CARL NEUBERG and LÁSZLÓ KARCZAG (*Biochem. Zeitsch.*, 1911, 36, 76—81).—This enzyme was found to be present in all the different races of yeast tried; almost all yeasts fermented pyruvic acid, whilst all fermented oxalacetic acid. The action of the enzyme may readily be demonstrated by incubating at 38°, 12 c.c. of a 1% solution of the acid with 2 grams of yeast in a Schrötter's fermentation tube. After twenty to twenty-five minutes a quantity of carbon dioxide will have collected, and the liquid in the tube will smell of acetaldehyde, the presence of which may be confirmed by its *p*-nitrophenylhydrazone.

The enzyme is distinct from zymase.

W. J. Y.

The Theory of Disinfection. REGINALD O. HERZOG and R. BETZEL (*Zeitsch. physiol. Chem.*, 1911, 74, 221—241).—Various antiseptics (chloroform, mercuric chloride, phenol, etc.) were investigated, and yeast was the organism selected for experiment. Adsorption plays a part in the process, and this is reversible; it follows the logarithmic law. This is the first phase in disinfection; the second is the chemical action of the disinfectant on the micro-organism; the law for this part of the action is not a simple one, as determined by counting the dead cells, and requires further investigation.

W. D. H.

Inhibiting Action and Germ-destroying Power of Free Sulphurous Acid, its Salts, and other Complex Derivatives. KESNARD HALLER (*Arch. Kreis Gesundheits-Amst.*, 1911, 38, 297—340).

—An account of comparative tests with solutions of various concentrations on moulds, yeasts, and bacteria. The experiments are divided into two classes, the "static" series, in which the nutritive mixtures containing the organism were allowed to remain under the influence of varying concentrations of the respective inhibiting reagents, and the "kinetic" series, in which the organism was submitted for a certain time to the inhibiting reagent, a culture then transferred to the nutritive broth, and the presence or absence of life demonstrated. The resistance of the organism to the concentration of the disinfectant, as a rule, followed the order, that if the concentration of the germicide sufficient to kill the very sensitive bacteria be taken as unity, then yeast would require four times, and moulds five times, that concentration for their destruction.

The compounds employed were sulphuric and sulphurous acids, sodium and sodium hydrogen sulphites, and the sodium sulphite compounds of acetone, formaldehyde, acetaldehyde, and dextrose respectively, their action being compared with each other and with phenol.

F. M. G. M.

The Respiration of Plants. W. ZALESKI and A. REINHARD (*Biochem. Zeitsch.*, 1911, 35, 228—245).—The destruction of the structure of the cells (by grinding in a mortar) causes in some plants an increased and in others a diminished respiration. The disintegration of the killed material, in contrast to the results obtained with the living material, has either no influence on the respiratory energy, as measured by the carbon dioxide output, or increases it. When the plants are killed, the anaerobic processes become more prominent; the more important the rôle played by such processes in the living plant, the less is the respiratory process of the plant interfered with when it is killed. The effects of various substances on the respiratory energy were also investigated. It was found that sugar solutions which had been fermented with zymine, and to a greater extent neutralised extracts of the corresponding quantity of zymine, or expressed yeast juice, stimulate the respiratory energy of pea and wheat seeds. Quinine has no effect on the respiration of sprouting pea seeds.

S. B. S.

The Nutrition of Green Plants with Formaldehyde and Formaldehyde-yielding Substances. THOMAS BOKORNY (*Biochem. Zeitsch.*, 1911, 36, 83—97).—Stronger solutions of formaldehyde are toxic to plants. From dilute solutions, however (0.001%), *spirogyra*, which has been rendered starch-free by keeping in the dark and treatment with calcium nitrate, can synthesise starch. Cress, also, which has been rendered starch-free, can form starch if kept under a bell-jar over sodium hydroxide solution to which has been added not too much formaldehyde (0.1%). With methylal, plants remained alive, but did not form starch until they were exposed to light. Algae can form starch from the sodium bisulphite compound of formaldehyde if

disodium or dipotassium phosphate is present, which renders the sodium sulphite set free harmless. With flowering plants, on the other hand, no definite positive result was obtained when this substance was used. Methyl alcohol stimulates the growth of pea-seedlings.

S. B. S.

Amounts of Substances Yielding Hydrogen Cyanide in Some Fruit Seeds. PAUL HUBER (*Landw. Versuchs.-Stat.*, 1911, 75, 462—482).—Native pear seeds contain no amygdalin, or not more than 0.0025%. Apple seeds were found to contain approximately the amounts of amygdalin found by Lehmann (0.46—1.21%). The seeds of sweet apples generally contain less hydrogen cyanide than those of sour apples. Seeds of apple and pear quinces cannot be distinguished by the amounts of amygdalin they contain.

Seeds of stone fruits contain considerably more hydrogen cyanide-producing substances than hitherto supposed. As much as 0.3% of hydrogen cyanide was obtained in some cases, corresponding with 5% of amygdalin.

No relation seems to exist between the amount of total nitrogen in the seeds and the amount of glucosides producing hydrogen cyanide.

N. H. J. M.

Phytase in Lower Fungi. ARTHUR W. DOX and ROSS GOLDEX (*J. Biol. Chem.*, 1911, 10, 183—186).—An enzyme which decomposes phytin into inositol and phosphoric acid was first noted in rice bran by Suzuki and his colleagues. It is probable that such an enzyme is present in all plants which contain phytin, or at any rate has a wide distribution. It has not been found in animal tissues; the present research shows that it occurs in various kinds of *Aspergillus*; the enzyme is present there in both the intra- and extra-cellular form.

W. D. H.

The Inulinase of *Aspergillus niger*. J. BOSELLI (*Ann. Inst. Pasteur*, 1911, 25, 696).—The secretion of inulinase by *Aspergillus* is the same whether inulin, sucrose, dextrose, levulose, or sucrose and peptone are employed. The enzyme diffuses with ease into the culture liquid, especially when the culture is old.

The optimum acidity for the activity of the enzyme varies with the acid used and inversely with the temperature; at 51° the optimum concentration of sulphuric acid is $N/200$, and that of acetic acid $N/12.5$. At a given temperature the amount of change corresponds with the concentration of acid, optimum concentrations of acetic and sulphuric acids leading to equal changes. Slight alkalinity arrests the action of inulinase. The rate of change conforms to the logarithmic law.

H. B. H.

Micro-chemistry of Plants. I. The Micro-chemistry of Birch Camphor. O. TUNMANN (*Chem. Zentr.*, 1911, i, 1656; from *Apoth. Zeit.*, 1911, 26, 344—345).—When small, thin lamellae of birch-bark are submitted to sublimation, the birch-camphor (betuline) is obtained as a crystalline sublimate; these crystals consist of long,

fine prisms or needles, which are grouped together in masses. They are soluble in aniline, slightly soluble in aqueous chloral hydrate solution, acetic acid, and benzene, and insoluble in water, alcohol, light petroleum, carbon disulphide, chloroform, and ether. The crystals yield a yellow coloration when treated with sulphuric acid. The quantity of birch-camphor in birch-bark may be estimated by the micro-sublimation process, and tables are given showing percentages of camphor for different lamellae.

W. P. S.

Soluble Carbohydrate of Chestnut Flour. GIOVANNI LEONCINI (*Chem. Zentr.*, 1911, i, 1873; from *Staz. sperim. agrar. ital.*, 44, 113—118).—The flour is extracted with water and a little lead acetate, and the filtrate polarised; about 26% of sucrose is present. Erythro-, amylo-, and acro-dextrin are absent. These are perhaps formed when the temperature at which the chestnuts are roasted is too high.

E. F. A.

Colour Changes Occurring in the Blue Flowers of the Wild Chicory, *Cichorium intybus*. JOSEPH H. KASTLE and R. L. HADEN (*Amer. Chem. J.*, 1911, 43, 315—325).—The flowers of the blue variety of the wild chicory, *Cichorium intybus*, are blue when they first open, but in the course of a few hours undergo a remarkable series of changes, first becoming pink, then white, and, finally, brown. The present investigation was undertaken in order to ascertain the causes of this phenomenon.

It has been found that the colour changes are partly due to variations in the amount of acid contained in the pigment-cells and partly to the action of an oxydase occurring in the flower which oxidises and destroys the pigment. It is shown that the decomposition of the pigment can also be brought about by the oxydase of the potato as well as by various other oxidising agents, such as potassium ferricyanide and permanganate, *p*-benzoquinone, and hydrogen peroxide.

The flowers of the white variety of the wild chicory rapidly wither and turn brown, and in this case also an oxydase is present.

E. G.

Occurrence of Fraxin in *Diervilla lutea*. CHARAUX (*J. Pharm. Chim.*, 1911, [vii], 4, 248—250).—The stalks and roots of the shrub *Diervilla lutea* (*D. Canadensis*) contain a glucoside which the author has identified as fraxin, a substance separated originally from *Fraxinus excelsior* and later from *Fraxinus ornus*, etc. A substance similar to saponin was also present.

W. P. S.

Micro-Chemistry of Plants. II. Detection and Localisation of Andromedotoxin in Ericaceæ. O. TUNNMANN (*Chem. Zentr.*, 1911, ii, 644; from *Apoth. Zeit.*, 1911, 23, 555—556).—Thin sections of parts of the plant are shaken with water for ten minutes and then treated with concentrated hydrochloric acid; in the presence of andromedotoxin, a greenish-blue coloration is produced, which changes gradually to violet-red. With 25% phosphoric acid solution a violet-

red coloration is also produced, and this coloration is still more intense when phosphoric anhydride is used. The compound is present in almost all parts of the leaves, the outer parts of the stalks, and capsules, and buds of *Ericaceae*; it has a powerful toxic action.

W. P. S.

The Green and the Yellow Colouring Matters of the Florideae. HARALD KYLIN (*Zeitsch. physiol. Chem.*, 1911, 74, 105—122).—As a contribution to the solution of the vexed question whether the green colouring matter extracted from florideae by alcohol is identical or not with the chlorophyll of higher plants, the author finds that the colouring matter from *Ceramium rubrum* contains magnesium (compare Willstätter and Isler, this vol., i. 392).

With regard to the yellow colouring matters in the florideae, the author has isolated from *Ceramium rubrum* three substances; one of these is carotin, another is xanthophyll (probably identical with the xanthophyll of higher plants), whilst the third (fucoxanthin?), which presents a great similarity to xanthophyll, but differs from it in its solubility in petroleum, is probably derived, not from the *Ceramium rubrum* itself, but from the diatomaceae and fucoids with which it is unavoidably contaminated.

C. S.

Composition of the Fat from the Seeds of *Lophira alata*. SAMUEL S. PICKLES and WILLIAM P. HAYWORTH (*Analyst*, 1911, 36, 493—494).—The fatty acids separated from this fat consisted of 50% of saturated acids comprising arachidic acid, m. p. 77.5°, palmitic acid, m. p. 62.5°, and a small quantity of another acid, and 50% of unsaturated acids consisting of about equal quantities of oleic acid and linoleic acid.

W. P. S.

Composition of Para Rubber-seed Oil. SAMUEL S. PICKLES and WILLIAM P. HAYWORTH (*Analyst*, 1911, 36, 491—492).—The composition of the mixed fatty acids obtained from a sample of Para rubber-seed oil was found to be: saturated (solid) acids, 14%, consisting of stearic acid, m. p. 69°, and an acid or mixture of acids, m. p. 56.5°, unsaturated (liquid) acids consisting of oleic acid, 32.6%, linoleic acid, 50.9%, and linolenic acid, 2.5%.

W. P. S.

Composition of Pear and Apple Seeds. PAUL HUBER (*Landw. Versuchs-Stat.*, 1911, 75, 443—461).—The dried seeds of two varieties of pears (1 and 2) and of apples (3) were found to have the following percentage composition:

	Fat.	Sugar.	Fur- furoids.	Crude fibre.	N		Ash.	Pas phos- phatides.	Pas lecithin
					as protein.	as bases.			
1.	24.84	5.13	6.72	10.90	4.981	0.205	3.33	0.048	1.23
2.	25.15	5.62	6.72	7.15	5.921	0.216	4.19	0.032	0.82
3.	24.03	3.42	6.68	8.96	4.87	—	8.79	0.038	0.99

The composition of the separated germs and husks is also given in each case.

N. H. J. M.

Localisation and Distribution of the Essential Oil in "*Eupatorium fruticosum*" (Linn.). LUIGI FRANCESCONI and R. SERRAVALLO (*Atti R. Accad. Lincei*, 1911, [v], 20, ii, 111—117).—The essential oil is present in the form of minute drops in the epidermis of the leaves, and in the cells immediately beneath it, and is abundant in certain small vessels which terminate there. Young leaves contain more than older ones. In the vessels of the stem, and in its epidermis (especially when young), the essential oil is present in considerable quantity, and is particularly evident in regions where growth is taking place. The root also contains it, but not in great amount. The oil is also present in the seed, to which it gives a strong, aromatic odour.
R. V. S.

Oil and Cholesterols of the Soy Bean. HERMANN MATTHES and A. DAHLER (*Arch. Pharm.*, 1911, 249, 424—435).—See this vol. i, 831, 858.

The Relation of Certain Non-leguminous Plants to the Nitrate Content of Soils. T. LYTTELTON LYON and JAMES A. HAZELL (*J. Franklin Inst.*, 1911, 171, 1—16, 205—220).—An account of numerous experiments intended to illustrate the relationship between soil, temperature, and nitrification, both in the presence and absence of growing crops. The results are tabulated, and the following facts deduced:

That the nitrate content of soil under timothy, corn, potatoes, oats, millet, and Soy beans was different for each crop when on the same soil.

There was a characteristic relationship between the crop and the nitrate content of the soil at different stages of growth.

During the most active growing period of the corn crop, nitrates were higher under corn than in cultivated soil bearing no crop; under a mixture of corn and millet at this period, the nitrates were higher than under millet alone, although the crop yields were about the same in each case.

Both under corn and oats the nitrate content was higher during the period when the crop was making its greatest draft on the soil nitrogen than in the later stages of growth; nitrates under these crops and under millet failed to increase late in the season when nitrogen absorption had practically ceased, although uncropped soil showed a very large increase in nitrates at that time; this fact is accounted for on the supposition that plants in later periods of growth exert a retarding influence on nitrification.

Changes in the moisture content, or in the temperature of soil under crops during the growing season, did not materially affect the nitrate content except under the legume soy beans, but on uncropped soil an increased moisture content during September was accompanied by a marked increase in nitrates.

F. M. G. M.

Analytical Chemistry.

Estimation of Moisture in Various Substances by means of Magnesium Methyl Iodide. TH. ZEREWITINOFF (*Zeitsch. anal. Chem.*, 1911, 50, 680—691).—The process is briefly as follows. The substance (coal, starch, etc.) is treated with anhydrous pyridine and a solution of magnesium-methyl iodide in amyl ether is added. The operation is carried out in a kind of a Lunge nitrometer, which is fully described and figured in the original paper. The moisture, being rapidly absorbed by the pyridine, is at once acted on by the reagent, and the methane evolved, which represents the water, is then measured with the usual precautions.

L. DE K.

Modified Cobalt Reaction for the Detection of Small Quantities of Hydrogen Peroxide. M. LEUCHTER (*Chem. Zeit.*, 1911, 35, 1111).—To a 1% solution of crystallised cobaltous chloride is added an equal volume of a solution of 1.6 parts of borax, 20 parts of glycerol (D 1.24), and 100 parts of water. One to two c.c. of the mixture are placed in a very narrow test-tube, and an equal volume of the liquid to be tested is carefully poured over the surface. If hydrogen peroxide is present, a brownish-black ring is formed at the place of contact, and if much is present, a decided evolution of gas will be noticed.

The above reaction is also given by perborates, but not by persulphates. On warming, however, these also give the reaction. Addition of a few drops of sodium hydroxide solution also promotes the reaction sometimes.

L. DE K.

Estimation of Fluorine [in Silicates]. M. KLEINSTÜCK (*Zeitsch. anal. Chem.*, 1911, 50, 697).—A solution of zinc oxide in ammonium carbonate is recommended for the removal of the last traces of silica from the alkaline solution.

L. DE K.

New Apparatus for the Estimation of Sulphur and Carbon in Iron and Steel. D. A. WENNMANN (*Zeitsch. angew. Chem.*, 1911 24, 1861—1862. Compare this vol., ii, 938).—*Estimation of Sulphur*.—In the estimation of sulphur the material is often dissolved in concentrated acid, which necessitates the passage of the gases evolved through water. The author finds that it is not necessary to have a continuous stream of cooling water, and has therefore devised a special cooler for the gases, which is fitted into the decomposition flask by a ground-glass joint, the whole apparatus being made of glass. Everything is so arranged that the gases evolved from the flask have to pass through water contained in the cooler before escaping to the absorption vessels. There are also the necessary tubes for running the acid into the flask, and for passing a current of carbon dioxide through the apparatus towards the end of the estimation. A diagram is given of the apparatus, which is very compact.

Estimation of Carbon.—A condenser is fitted into the decomposition flask by a ground-glass joint, a special tube being sealed through the bottom of the condenser for leading gases free from carbon dioxide through the apparatus. A diagram is given. T. S. P.

Estimation of Sulphuric Acid in Soils. P. DE SORNAVY (*Bull. Assoc. Chim. Sucr. Dist.*, 1911, 29, 133—136).—The soil (10 grams), with 1 gram of potassium nitrate and 5 c.c. of water, is dried on a sand-bath, ignited, treated with 25 c.c. of hydrochloric acid, and evaporated on a sand-bath until all the silica is rendered insoluble. It is then treated with 20 c.c. of hydrochloric acid and 5 c.c. of water, heated for thirty to forty-five minutes on a sand-bath, filtered, and washed with about 100 c.c. of water. Barium chloride is then added, and the estimation completed in the usual manner. N. H. J. M.

Rapid Estimation of Nitrogen. OSWALD CLAASSEN (*Chem. Zeit.*, 1911, 35, 1130—1131).—Three grams of the dried and thoroughly powdered and mixed sample are heated in a Kjeldahl flask with 20 c.c. of sulphuric acid, 5 grams of potassium sulphate, and eight drops of mercury. Heat is applied first to the sides of the flask for ten minutes, after which the flask is placed in the usual position. The operation is finished within twenty to thirty minutes. In order to hasten the cooling, a small lump of ice may be introduced.

The soda solution used for the titration may be checked as follows. The ammonia evolved by boiling 1 gram of ammonium chloride with aqueous sodium hydroxide is collected in standard sulphuric acid, and the excess of acid is then titrated back. If the acid itself requires 146.1 c.c. of soda solution, and after the operation only 39.6 c.c., 106.5 c.c. of soda solution have been used up, corresponding with 0.0262038 gram of nitrogen; 1 c.c. therefore equals 0.00245844 gram.

L. DE K.

Apparatus for the Estimation of Nitrogen by Kjeldahl's Method. KRIEGER (*Chem. Zeit.*, 1911, 35, 1063).—In order to avoid loss of ammonia during neutralisation, and bumping during distillation, the flask is provided with a tap-funnel, through which the alkali is introduced, the stem of the funnel having a branch through which steam may be passed.

A simpler method is to employ a large flask, of 500 c.c. capacity for 20 c.c. of sulphuric acid, and add a little mercury. After cooling, 250 c.c. of water are added, followed by 10 c.c. of 4% potassium sulphide and 50 c.c. of concentrated sodium hydroxide solution. Neutralisation and distillation are completed without loss of ammonia.

C. H. D.

Analysis of Lime Saltpetre, "Kalk Stickstoff," and "Stickstoff Kalk." E. DINSLAGE (*Chem. Zeit.*, 1911, 35, 1045—1046).—*Lime Saltpetre.*—The analysis (including the estimation of any nitrite) is conducted like that of an ordinary crude nitre. The moisture, however, cannot be readily estimated in the ordinary way, but may be determined within twenty minutes by heating 3—5 grams

of the sample in a porcelain crucible over a small flame some 10 cm. distant from the crucible. Care must be taken that the mass does not melt.

"*Kalk Stickstoff*."—The usual Kjeldahl process gives unsatisfactory nitrogen figures, but the following modification gives trustworthy results. One gram of the sample is boiled in a flask with 30 c.c. of a mixture of equal vols. of sulphuric acid and water, with addition of a few drops of mercury. The conversion into ammonia is complete in at most two hours; addition of potassium sulphate towards the last is superfluous. The ammonia is then distilled off as usual. The estimation of the various mineral constituents and pre-existing ammonia is carried out by the usual analytical methods.

"*Stickstoff Kalk*."—The same process as for "*Kalk Stickstoff*" is recommended. This product is distinguished from the former by its dark colour and tarry odour, and by its chlorine content.

L. DE K.

Estimation of Phosphoric Acid by Direct Weighing of Ammonium Phosphomolybdate. NORBERT VON LÖNNER (*Oesterr. Chem. Zeit.*, 1911, 14, 1—5. Compare Abstr., 1908, ii, 777, 895, 983).—Experimental details of methods previously advocated for the direct estimation of phosphoric acid as ammonium phosphomolybdate in soils, manures, and vegetable ash are discussed. A detailed account is given of the author's method of preparing the required reagents, the amount of material to employ, and the modifications recommended in the respective cases of various soils, soluble phosphatic manures, basic slag, superphosphates, and bone meal.

F. M. G. M.

Estimation of Arsenic in Pyrites. GEORG HATTENBACH (*Oesterr. Zeitsch. Berg. & Huttenwesen*, 1911, 59, 175—178).—The author discusses Viletrup's method for the analysis of pyrites (Abstr., 1910, ii, 458), and recommends that the arsenious sulphide be redissolved in hydrochloric (or hydrobromic) acid treated with bromine and subsequently heated to remove excess, the solution rendered ammoniacal, and the arsenic reprecipitated as magnesium ammonium arsenate; this is collected after twenty-four hours, redissolved, and estimated by any of the known methods, or the redissolved sulphide may be evaporated with nitric acid until free from chloride, the arsenic precipitated as silver arsenate, collected, ignited, and the metallic silver weighed.

F. M. G. M.

Detection of Small Quantities of Arsenic in Urine, Blood, and Other Organic Substances. GEORG LOCKEMANN (*Biochem. Zeitsch.*, 1911, 35, 478—493).—The following processes are described: (1) The destruction of organic matter: for which fuming nitric acid and a mixture of potassium and sodium nitrates are employed. (2) The precipitation of the arsenic: which is brought about by adding ferric ammonium sulphate to the solution and precipitating therefrom ferric hydroxide by the quantitatively correct amount of ammonia solution. (3) The detection of arsenic in this precipitate by a

personally constructed Marsh apparatus. The last traces of arsenic are removed from the reagents by the ferric hydroxide method, the full experimental details of which are given in the paper. S. B. S.

Estimation of Carbon in Irons and Steels in the Electric Furnace. HANS AUGUSTIN (*Zeitsch. angew. Chem.*, 1911, 24, 1800—1803).—The process recommended is essentially the same as the one described by Lorenz (Abstr., 1893, ii, 491). The sprinkling over the iron with lead chromate cannot be recommended, but the use of copper oxide in the front part of the porcelain combustion tube is absolutely necessary to ensure complete oxidation of the carbon.

An electric furnace is described and figured, whereby it is possible to heat the iron at 1000° and the copper oxide layer at 800° . The combustion is carried out in a current of purified oxygen, and after passing through drying tubes containing sulphuric acid, the carbon dioxide is absorbed in the usual soda-lime tubes. L. DE K.

Analysis of Graphite. FRIEDRICH MAYER (*Chem. Zeit.*, 1911, 35, 1024—1025).—The amount of carbon present in graphite may be estimated by taking the calorific value of the substance. In order to ensure the complete combustion of the graphitic carbon, 0.6 gram of the graphite is mixed with 0.4 gram of pure benzoic acid, and the calorific value of the mixture is determined in a Berthelot's bomb. One kilo. of graphitic carbon yields 7900 Cal., and 1 kilo. of benzoic acid, 6322 Cal. If the graphite under examination contains sulphur, an allowance must be made for its quantity. For this purpose, the sulphuric acid formed during the combustion is estimated by titrating the solution of the acid in the water contained in the bomb; for each c.c. of $N/10$ solution required for the titration, 7.06 Cal. are deducted from the result first obtained. W. P. S.

Detection of Carbon Monoxide by means of Blood. HARTWIG FRANZEN and O. VON MAYER (*Zeitsch. anal. Chem.*, 1911, 50, 669—697).—The gas to be tested is shaken with blood (preferably ox-blood), which is then examined for carbon monoxide by one of the usual methods. The original Hoppe-Seyler sodium hydroxide process cannot be recommended, but the Salkowski modification of the same readily detects 1% of carbon monoxide in the blood. Salkowski's hydrogen sulphide method and Rubner's tannin process are less delicate, only showing 5% or above. The Kunkel and Welzel ferrocyanide method and their original tannin process are also capable of indicating as little as 1% of carbon monoxide. The full details of these processes, with some comments by the authors, are recapitulated in the original article. L. DE K.

Microchemical Analysis of Silicates. RICHARD CANAVAL (*Zeitsch. prakt. Geol.*, 1910, 18, 460—461).—A process by which the constituents of refractory minerals can be qualitatively determined. The finely powdered substance is thoroughly mixed with an equal volume of lead oxide, and carefully fused in small portions to a globule on an aluminium spoon; the cooled pulverised globule is then frequently

evaporated with nitric acid, after which the silica, lead, and other constituents can be separated or identified by various processes described in the original.

F. M. G. M.

Detection of Silicates, Fluorides, and Silicofluorides. FARRAR E. BROWNING (*Amer. J. Sci.*, 1911, [iv], 32, 249—250).—A small lead cup about 1 cm. in diameter and depth is made by running the melted metal into a mould, and a flat piece of lead with a small hole in the centre is used as a cover. Into this cup is placed about 0.1 gram of powdered calcium fluoride, together with 0.1 gram or less of the silicate, and the mixture is carefully moistened with a few drops of sulphuric acid. Upon the upper side of the cover is placed a piece of moistened black paper, and upon this a small moistened pad of ordinary filter paper, so as to keep the black paper moist during the ten minutes heating on a steam-bath. At the conclusion of the experiment a white deposit is found on the underside of the black paper over the opening in the cover if silica was present in appreciable amount. Conversely, the process may be used for the detection of fluorides by heating these with silica and sulphuric acid; silicofluorides are decomposed by sulphuric acid readily in the cold.

L. DE K.

Qualitative Analysis of Metals without Employment of Hydrogen Sulphide or Ammonium Sulphide. G. P. FARRAR (*Mon. Sci.*, 1910, [iv], 24, 11, 641—644).—The mixed metals are evaporated several times with nitric acid, whereby stannic oxide and antimony tetroxide are separated.

Silver chloride, mercurous chloride, and lead chloride are precipitated with hydrochloric acid; after boiling with ammonium chloride bismuth oxychloride separates; the filtrate is rendered alkaline with potassium hydroxide, and ammonia eliminated by boiling; the solution is again cleared by boiling with hydrochloric acid, after which the addition of potassium hydroxide and hydrogen peroxide precipitates the oxides and hydroxides of manganese, cobalt, nickel, copper, mercury, iron, titanium, zirconium, uranium, and part of the magnesium; the solution is then acidified with hydrochloric acid and saturated with ammonia, when aluminium phosphate and hydroxide separate.

The solution is acidified, and on subsequent treatment with ammonium carbonate yields barium, strontium, and calcium carbonates, and when again acidified, followed by the addition of potassium ferrocyanide, furnishes zinc hydroxide; the further addition of hydrogen peroxide and ether precipitates the chromium, leaving out the arsenic and remainder of the magnesium, which are finally precipitated with excess of ammonium hydroxide. The further separation of the individual elements is carried out by known methods.

The presence of iron being found to vitiate the hydrogen peroxide test for titanium, the author recommends the employment of potassium persulphate in dilute sulphuric acid solution, accompanied by a control containing the equivalent colorimetrically in ferric sulphate to which hydrogen peroxide and a standard solution of a titanium solution are added for comparison.

F. M. G. M.

A Method of Qualitative Analysis. D. A. ROCHE (*Mon. Sci.*, 11, [v], 1, 1, 87. Compare preceding abstract).—An adverse criticism of Pamfil's method of analysing metals without the employment of hydrogen sulphide or ammonium sulphide; the author states that the possibility of other insoluble residues besides stannic oxide and antimony tetroxide remaining after treatment with nitric acid is not considered, and suggests the presence of silica, titanium oxide (TiO_2), and possibly barium sulphate; also, that the separation of lead is not complete, that the silver would be liable to be overlooked, and that phosphoric acid would be precipitated before the stage indicated by Pamfil.
F. M. G. M.

Potassium: its Detection as the Cobaltinitrite. LEON T. BOWSER (*J. Amer. Chem. Soc.*, 1911, 33, 1566–1569).—The sensitiveness of the author's method for detecting potassium as the cobaltinitrite (Abstr., 1910, ii, 346) can be greatly increased by trying out the test in the following manner. Two tall beakers, of 100 c.c. capacity, are placed side by side on a mirror. In one beaker are placed 5 c.c. of the solution to be tested, and in the other, 5 c.c. of water, and to each are added 2.5 c.c. of the sodium cobaltinitrite reagent and 5 c.c. of 95% alcohol. If, on looking down through the solutions into the mirror, the image of the observer appears equally sharp in each case, potassium is not present, but the image is dimmed by the liquid in the beaker containing the solution under examination, potassium is present to the extent of 1 or more parts per million. Care must be taken to ensure the absence of ammonia, since ammonium salts are readily precipitated by the reagent, 10 parts per million being sufficient to yield a visible turbidity. It is also of importance that the solution should be either neutral or slightly acidified with acetic acid.
E. G.

New Indicator for the Estimation of Alkalis in Blood. OTTO BERNHARDT (*Chem. Zentr.*, 1911, i, 1763; from *Wien. klin. Woch.*, 1911, 24, 606–607).—An indicator, consisting of a mixture of 2 volumes of 1% "alizarinsulphazid" solution and 1 volume of 1% ergo-carmin solution, is recommended for use in the estimation of alkalis in blood according to Engel's method (titration with $N/75$ -tartaric acid solution); the indicator exhibits a dark green colour in acid solution, and reddish-violet in alkaline solution.
W. P. S.

Estimation of Calcium and Magnesium in Hard Water. RUDOLPH NOTENAGEL (*Veröffentlichungen aus dem Gebiete des Militärärztlichen Wesens*, Heft 45; *Arbb. Hyg.-chem. Untersuchungsstellen*, 1911, i, Tl. 76–85. Compare Grittner, Abstr., 1902, ii, 696).—A review of the work of Winkler and Grittner, with numerous tables illustrating the results obtained by various modifications in the experiments carried out by these and other workers.
F. M. G. M.

Estimation of Very Small Amounts of Calcium by means of Potassium Permanganate. LEON T. BOWSER (*J. Ind. Engin. Chem.*, 1911, 3, 82–84).—The solution (5–10 c.c.) containing a

minimum of 0.3 mg. of calcium is treated with a few drops of ammonium hydroxide and about 0.4 gram of ammonium chloride, boiled, and 0.2 gram of ammonium oxalate added, again boiled, and diluted with about its own volume of a 3% solution of ammonium hydroxide and allowed to remain several hours.

The precipitate is collected by suction on an asbestos pad in a form of "Shimer" form, washed with 3% ammonium hydroxide, and the pad with adherent precipitate transferred to a beaker and treated with 1 c.c. dilute sulphuric acid (50%), titrated in boiling solution with excess of $N/200$ -potassium permanganate, and the excess titrated back with $N/200$ -oxalic acid. The amount of potassium permanganate consumed by the asbestos, water, and acid must be determined by blank experiments; the first titration of the asbestos outlines as the impurities, and a second one should be made for the amount to be deducted in the future employment of that pad; one pad suffices for about twelve experiments. Special burettes graduated in 0.01 and 0.01 c.c. are employed, with the ends drawn out so that 10 drops are equivalent to 0.15 c.c. of the solution. The $N/200$ -solution of permanganate is not oxidised as much as it should be by theory, therefore it must be standardised against a calcium oxalate solution of approximately the same concentration as that employed in the estimation.

F. M. G. M.

Detection of Certain Elements which Form Insoluble Sulphates: Barium, Strontium, (Calcium) and Lead. PAUL E. BROWNING and PHILIP L. BLUMENTHAL (*Amer. J. Sci.*, 1911, [3], 32, 246—248).—Ten c.c. of the solution are precipitated with hydrochloric acid, and to the filtrate are added 5 grams of ammonium acetate and an excess of 10% solution of ammonium sulphate. After warming the liquid, the sulphates are collected and washed with a saturated solution of ammonium acetate until free from lead; the filtrate and washings are then kept for further testing. After placing in the filter a little sugar carbon, the paper is rolled up and heated in a covered porcelain crucible to full redness for a few minutes. The fused mass is then heated with 5 c.c. of 50% acetic acid to decompose the sulphides formed. The filtrate is then tested for barium with potassium dichromate, and in the filtrate from the barium chromate the strontium and calcium are reprecipitated by boiling with sodium carbonate. The washed carbonates are re-dissolved in nitric acid, and the liquid is examined spectroscopically; if the amount is not too small, the nitrates may be separated by boiling with amyl alcohol.

L. DE K.

Estimation of Magnesium as Oxide. O. KALLAUNER (*Chem. Zeit.*, 1911, 35, 1165—1166).—The author confirms the statements of Krause and others that magnesium chloride cannot be readily converted into oxide by simple ignition.

Berzelius's method (evaporation of the magnesium chloride solution with mercuric oxide, and ignition of the residue) gives technically correct results, provided that the operation is several times repeated, for even a double treatment with mercuric oxide gave in one of the author's experiments a residue which still contained chlorine.

L. DE K.

Analysis of Cuprous Iodide. H. BARDT (*Zeitsch. anal. Chem.*, 1911, 50, 695—696).—Five grams of the sample are repeatedly treated with dilute ammonia by decantation and filtration into a half-litre flask until the filtrate is free from copper. The residue is then treated with nitric acid in case it should still contain any copper.

An aliquot part of the ammoniacal solution is placed in a 500 c.c. electrolytic vessel, 5 grams of tartaric acid are added, and then again so much ammonia that there is an excess of about 1—1.5% present. From this solution, the copper is then separated electrolytically as usual. When completely deposited, the cathode is removed and carefully rinsed. The adhering copper is then dissolved in 30 c.c. of nitric acid, diluted to 500 c.c., and, after adding 5 c.c. of sulphuric acid, the solution is again electrolysed (N.D. 100—0.5 ampère), using the same cathode. Similarly, the copper is recovered from the nitric acid solution of the insoluble residue. Any copper present as sulphate may be extracted from the sample with water. To the liquid free from copper are added 20 c.c. of chloroform and then an excess of hydrochloric acid. The iodine liberated is then titrated with *N*/10-bisulphate.

L. DE K.

The Spectroscopic Recognition of Traces of Mercury in Nitrocellulose. Stability in Explosives. JEAN FLORIN (*Zeitsch. für Schiess. Sprengstoffwesen* 1911, 8, 21—22, 63—66).—A detailed description of methods employed to demonstrate spectroscopically the presence of mercury in nitrocellulose. Illustrations of the spectro-scope and other apparatus employed, with tabulated results and curves, are given in the original.

F. M. G. M.

Time Curves for Cadmium Deposited from Organic Electrolytes. MARY V. DOVER (*J. Amer. Chem. Soc.*, 1911, 33, 1577—1583).—Holmes and Dover (Abstr., 1910, ii, 1111) have shown that cadmium can be deposited in a satisfactory form from various organic electrolytes when the rotating spiral anode is employed and the current is less than one ampere, but that the character of the deposit varies considerably with the different electrolytes. Experiments have now been made to determine the rate of deposition and the quantity of the metal that can be deposited from each electrolyte in a sufficiently adhesive form to allow of accurate weighing. Curves have been constructed for each electrolyte, the time being plotted as the ordinates and the amounts of cadmium deposited as the abscissae.

It has been found that the maximum quantity of cadmium which will form an adhesive deposit and the rate of deposition vary greatly with the different electrolytes. The data are recorded for cadmium acetate, formate, and lactate in each of the acetate, formate, and lactate electrolytes. The deposits are finer and more adhesive when the solution is decidedly acid, but if too much acid is used, the last traces of the metal cannot be deposited.

E. G.

Estimation of Colloids in Arable Soil. JOSEF KÖNIG, JULIUS LASSENBAUMER, and C. HASSLER (*Landw. Versuchs-Stat.*, 1911, 75, 77—441).—The amounts of colloids in soils may be estimated by

means of a solution of methyl-violet of such a strength that a distinct colour remains after absorption by the soil. Solutions containing 1, 2, and 3 grams per litre may be employed. Absorption of salts was estimated by means of a $N/50$ -solution of tricalcium phosphate.

Potassium is chiefly absorbed by the colloidal clay, and it can be more or less completely liberated by oxidation with hydrogen peroxide or by an electric current. Phosphoric acid, on the other hand, is mainly chemically fixed by the production of insoluble phosphates of calcium, etc. The combination is rendered more complete by the action of heat, and even strong electric currents fail to dissolve the phosphoric acid completely.

A method is described for estimating the readily soluble constituents of soils by means of an electric current. The results, as regards potassium, are approximately the same as those obtained by steaming under pressure and oxidation. Results obtained by the latter method agreed well (in the case of potassium) with the amounts actually assimilated by plants.

N. H. J. M.

Estimation of Ferric Oxide in the Presence of Alumina. KRIEGER (*Chem. Zeit.*, 1911, 35, 1054).—The weighed mixed oxides, which need not be powdered, are introduced into an Erlenmeyer flask and boiled gently with a mixture of 25 c.c. of sulphuric acid and 25 c.c. of water. After five to ten minutes the iron oxide has dissolved, as may be noticed from the colour of the undissolved alumina. When cold, another 50 c.c. of water and some zinc are added, and finally the iron is titrated with permanganate as usual.

L. DE K.

Gravimetric Estimation of Nickel and Cobalt. L. DE K. (*Chem. Zeit.*, 1911, 35, 1077).—To the solution containing the nickel or cobalt is added a very slight excess of potassium hydroxide solution, and then a solution of potassium persulphate. When the supernatant liquid has become colourless, the precipitate is washed with cold water and then collected on a filter. After ignition the oxide is reduced by heating in a current of hydrogen, and the nickel or cobalt, is then weighed as metal. Salts of ammonium should be absent.

L. DE K.

Rapid Estimation of Nickel in Steel. G. RAULIN (*Mon. No.* 1911, [v], 1, i, 84—86).—One gram of a steel containing about 10% nickel is dissolved in 10 c.c. hydrochloric acid diluted with an equal amount of water, boiled with 10 c.c. nitric acid, and treated with 200 c.c. water; ammonium hydroxide is added until the solution becomes red but remains clear, followed by a calculated excess of potassium cyanide, and then by a further quantity of ammonium hydroxide, after which the solution is filtered and made up to a volume of 500 c.c. Half of this is removed, treated with 10 c.c. of ammonium sulphate solution, and five drops of potassium iodide solution, followed by titration with silver nitrate; 0.24% must be subtracted from the nickel found as due to the action of the cyanide. The solutions employed should contain respectively the following weight of each salt in grams to the litre: silver, nitrate 5.788; potassium cyanide

4.45, accompanied by 0.5 of sodium hydroxide; potassium iodide, 300; and ammonium sulphate, 600. The duration of the operation is about half an hour.

F. M. G. M.

Application of Methyl-orange in the Colorimetric Estimation of Titanium. ANDRÉ GAUTIER (*Rev. gén. Chim. pure appl.*, 1911, 14, 16—17).—The stability of methyl-orange as a colorimetric reagent renders it suitable for employment in the estimation of titanium. The relative concentrations of the titanium and methyl-orange solutions which it is advisable to employ are tabulated in the original.

F. M. G. M.

Assay of Platinum. ALBERT STEINMANN (*J. Suisse Chim. Pharm.*, 1911, No. 32, 33, Reprint 8 pp.).—The usual process of cupellation with silver and lead and separation of the silver from the button obtained by boiling with sulphuric acid is not correct, as platinum, in the circumstances, is far from totally insoluble in the acid. The loss, however, is somewhat compensated by the platinum retaining some lead and silver.

The author has found that by using a slightly diluted acid (100 vols. strong acid, 22 vols. water) and heating at 240°, the solvent action of the acid on platinum is reduced to a minimum. The retention of lead and silver in the button may be prevented by adding a suitable amount of copper before cupellation.

L. DE K.

New Method for the Destruction of Organic Matter by Bromine, Specially Applicable in Toxicology. GEORGES MACIS (*J. Pharm. Chim.*, 1911, [viii], 4, 302—306).—The substance to be destroyed is treated with bromine in a long-necked flask, and heated on the water-bath. The process is stated to be more rapid, and to give better results than the methods hitherto employed.

W. O. W.

Estimation of Organic Matters in Waters from Sulphur Springs. MAX DITTAICH (*Zeitsch. anal. Chem.*, 1911, 50, 697—700).—The usual method of permanganate titration cannot be applied to waters containing hydrogen sulphide unless the latter is first removed. The author recommends for this purpose a solution of cadmium sulphate. It is, however, necessary to analyse a sample freshly obtained, otherwise the sulphur is not completely removed, and too much permanganate will be consumed.

L. DE K.

Estimation of Caoutchouc as Tetrabromide; the Decomposition of the Bromide by Nitric Acid. DAVID SPENCER, J. C. GALLETT, and J. H. SCOTT (*Gummi Zeit.*, 1911, 25, 801—803).—The experimental methods advocated by Karneck and Budde (this vol., ii, 545) for the estimation of bromine in caoutchouc tetrabromide are discussed, and a dozen experiments described which show that different results can be obtained by varying the experimental details; these include the presence or absence of silver nitrate during the decomposition and the employment of excess or otherwise, varying

the concentration of the nitric acid and the temperature at which decomposition is carried out, and replacing sealed tubes by other forms of apparatus.

F. M. G. M.

Hübener's Caoutchouc Tetrabromide. GRAHARD HUBENER (*Gummi-Zeit.*, 1911, 25, 634, 751—752); R. BECKER *ibid.*, 677—678).—Polemical in reference to Hübener's method for estimating bromine in caoutchouc tetrabromide.

F. M. G. M.

A New Method of Estimating Alcohol Vapour. A. BAUDREXEL (*Woch. Brauer.*, 1911, 28, 21—23. Compare *Abstr.*, 1906, ii, 584).—A sketch of the apparatus employed, with an account of the method by which the author estimates minute quantities of ethyl alcohol colorimetrically by passing the vapour into a solution of potassium dichromate in sulphuric acid.

F. M. G. M.

The Proportion of Dextrose to Lævulose in Certain Preserved Fruits. FAVREL and GARNIER (*J. Pharm. Chim.*, 1911, [vi], 4, 253—255).—The authors find that apricot pulp, dried apricots, and prunes contain about twice as much dextrose as lævulose, and that, consequently, the detection of an excess of dextrose in preserves made from these fruits does not necessarily indicate that added dextrose is present.

W. P. S.

Viscosity of Saccharine Solutions. PH. ORTH (*Bull. Assoc. Chim. Sucr. Dist.*, 1911, 29, 137—148).—The viscosity of saccharine solutions may be expressed by the following equations:

$\log(\log \eta) = 0.069498 - 2 + 0.03381935(x + Kn) - 0.009818782x$
and $100K = 156.89 - 0.81586m + (0.0187228m - 1.38441)t$,
in which η is the viscosity compared with distilled water at 20° = 1, x the amount of sugar % obtained by inversion (Clerget), n the non-sugar %, m the dry matter, and t the temperature. The equations hold good with percentages of sugar between 60 and 76, with dry matter between 65 and 82%, and at temperatures from 20° to 30°.

Viscosity increases very rapidly with diminished temperature, especially when the concentration is high.

N. H. J. M.

Detection of Small Quantities of Disaccharides. CARL NEUBERG and SUMIO SANEYOSHI (*Biochem. Zeitsch.*, 1911, 36, 44—55).—The method is applicable to those disaccharides which form phenylosazones.

Maltose may be detected in the presence of other disaccharides by converting into the osazones, dissolving in water, and treating with yeast maltase for two days. The maltosazone is converted by the enzyme into glucosazone and dextrose. The solution is filtered and treated with mercuric acetate, and the dextrose estimated in the filtrate by Fehling's solution after removal of the excess of mercury with hydrogen sulphide.

In this way 0.01 gram of maltosazone may be detected. iso-Maltosazone is not attacked by yeast enzymes, but may be hydrolysed by heating with 1.5% sulphuric acid, when dextrose is set free and may be detected as before. Lactosazone and melibiosazone may be hydrolysed with emulsin or kefir-lactase, or by heating with 1.5% sulphuric acid

with formation of galactose and glucosazones. The method allows of the detection of these substances in presence of hexoses and of pentoses, the osazones of which will not be hydrolysed in the above manner.

W. J. Y.

The Estimation of Carbohydrates by Oxidation with Permanganate in Alkaline Solution. W. GREIFENHAGEN, JOSEF KÖNIG, and A. SCHOLL (*Biochem. Zeitsch.*, 1911, 35, 169—193).—All carbohydrates, multivalent alcohols, the corresponding aldehydes and ketones, and polysaccharides are oxidised in alkaline solutions quantitatively to oxalic acid and carbon dioxide. The details of the method for estimating the oxidation products are given by the authors. If the oxidation is carried out with standardised permanganate solution and the reaction mixture is afterwards acidified, then by titration of the excess of permanganate with oxalic acid, the amount of oxygen used in the oxidation process can be determined. The terminal groups of the sugars appear to be oxidised in alkaline solution to carbon dioxide, the intermediate groups yielding oxalic acid. In the case of ethylene glycol and erythrol, the results obtained indicate the formation of polymeric acids as intermediate products. Formic acid was never detected amongst the oxidation products.

S. B. S.

The Estimation of Starch. W. GREIFENHAGEN, JOSEF KÖNIG, and A. SCHOLL (*Biochem. Zeitsch.*, 1911, 35, 194—216).—The polarimetric method of Lintner's (polarisation after treatment with cold more concentrated hydrochloric acid) and of Ewer's (polarisation after treatment with warm more dilute acid) are applicable to all varieties of starch. The rotatory power by Lintner's process is about the same for all kinds of starch ($+202^\circ$), whereas that by Ewer's differs for the different starches from maize, rice, wheat, rye, barley, and oats, but has a mean value of about 183° . In applying the method to fodder, etc., it is advisable to treat the material first with water, alcohol, and ether to remove other substances which effect the polarisation. Cellulose, hemicellulose, and pentosans have no effect in these processes. Condiments and food-stuffs can also be examined by the methods; in certain cases (for example, cinnamon) the material should be treated with hot alcohol before submitting it to either process. The conclusion is drawn that these processes are as valuable for examination of foodstuffs as the ordinary gravimetric methods.

S. B. S.

Estimation of Volatile Acids in Wine. A. VERDA (*Chem. Zentr.*, 1911, ii, 643; from *Schweiz. Woch. Chem. Pharm.*, 1911, 49, 340—341).—The usual method of estimating the volatile acids in wine (titration of 200 c.c. of distillate obtained by distilling 50 c.c. of the wine with steam) appears to yield low results in the case of wines from Southern Italy; it is recommended, therefore, that the distillation be continued until the distillate no longer exhibits an acid reaction when tested with litmus paper, showing that the whole of the lactic acid present has distilled.

W. P. S.

Estimation of Free Fatty Acids in Fats in the Presence of Soap and Alkaline-earth Soaps. DAVID HOLDE and JULIUS MARCUSSEN (*Zeitsch. angew. Chem.*, 1911, 24, 1945—1948).—In order

to prevent hydrolysis of the soaps, the following process is recommended for the estimation of free fatty acids in mixtures consisting of fat, mineral oil, soap, and calcium or magnesium soaps: Ten grams of the sample are boiled under a reflux apparatus with 50 c.c. of a mixture consisting of 9 vols. of "benzine" and 1 vol. of absolute alcohol until solution of the sample is attained. The hot solution is then filtered, and the filter is washed with a small quantity of the "benzine"-alcohol mixture. The filtrate and washings are now mixed in a separating funnel with 30 c.c. of 50% alcohol (by volume), shaken thoroughly, and titrated with $N/10$ -alkali solution, using phenolphthalein as indicator; the end-point of the titration is indicated by the appearance of a pink coloration in the lower layer of the contents of the funnel (compare Abstr., 1910, i, 538).

W. P. S.

Analysis of Lactic Acid. W. KLAPPROTH (*Chem. Zeit.*, 1911, 35, 1026—1027).—The following process is recommended for the estimation of lactic acid and lactic anhydride in samples of commercial lactic acid. One gram of the acid is diluted with 20 c.c. of water and titrated with $N/1$ -sodium hydroxide solution, phenolphthalein being used as the indicator. The quantity of alkali used corresponds with the lactic acid present, together with one-half of the anhydride. An excess of from 1 to 3 c.c. of the sodium hydroxide solution is now added, the solution is heated for five minutes on a water-bath, the excess of alkali is titrated with $N/1$ -sulphuric acid, 1 c.c. of the latter is added in excess, and, after being heated for two minutes on a water-bath, the mixture is titrated with $N/1$ -sodium hydroxide solution. The quantity of alkali used in these operations, after allowing for the sulphuric acid added, is equivalent to the second half of the lactic anhydride present. A simple calculation then gives the quantities of lactic acid and anhydride in the sample.

W. P. S.

[Estimation of Lactic Acid in Blood.] H. FRIES (*Biochem. Zeitsch.*, 1911, 35, 368—385).—See this vol., ii, 994.

Estimation of Tartaric Acid in Apples, Pears, Cider, and Perry. G. WARCOLLIER (*Ann. Falsif.*, 1911, 4, 485—490).—The author finds that, as a general rule, apples, pears, cider, and perry do not contain tartaric acid. For the estimation of this acid, when present, the method described by Kling (Abstr., 1910, ii, 350), was found to be the most trustworthy. The methods proposed by Berthelot and de Fleuriou, Pasteur and Reboul, Mestrezat (Abstr., 1906, ii, 635), and Muttelet do not yield satisfactory results.

W. P. S.

Detection of Small Quantities of Glycuronic Acid as Osazone. CARL NEUBERG and SUMIO SANEYOSHI (*Biochem. Zeitsch.*, 1911, 36, 56—59).—The phenylosazone of glycuronic acid gives the naphtharesorcinol test (violet-colour when heated with naphthol-resorcinol and hydrochloric acid). The colour may be extracted with benzene or chloroform, giving a violet solution. The presence of pentosazones, hexosazones, and disucrosazones does not interfere with the

reaction, since no colour is extracted by the benzene or chloroform in these cases. If ether be used in place of benzene, the extract is always more or less violet with other osazones. In this way, 0.001 gram of glycuronic acid osazone may be detected. W. J. Y.

Estimation of Benzoic Acid. OTTO FOLIN and FRED F. FLANDERS (*J. Amer. Chem. Soc.*, 1911, 33, 1622—1626).—In an investigation of cranberries, it was found that the benzoic acid could be satisfactorily estimated by titrating a solution in chloroform, from which all the acids except benzoic had been removed, with sodium ethoxide solution.

In attempting to apply this method to the estimation of benzoic acid in ketchup, it was found that several other acids as well as benzoic acid are extracted by the chloroform, and, after numerous experiments, the following method was devised.

The ketchup (25 grams) is placed in a 50 c.c. beaker, 2 c.c. of concentrated nitric acid are added, and about 0.2—0.3 gram of sodium nitrite is introduced in small portions, the mixture being well stirred after each addition. The liquid is rinsed into a 500 c.c. separating funnel by means of 200 c.c. of saturated ammonium sulphate solution, and is then extracted five times with chloroform. The chloroform is transferred to another separating funnel, and shaken with 200 c.c. of a saturated solution of sodium chloride, slightly acidified with hydrochloric acid. It is then transferred to a third separating funnel, again shaken with 200 c.c. of the acidified salt solution, and then run off into a 500 c.c. Erlenmeyer flask and titrated with standard sodium ethoxide solution in presence of a few drops of alcoholic phenolphthalein.

The repeated washing with salt solution does not remove cinnamic acid, and any of this acid which may be present will therefore be estimated with the benzoic acid. The method is rapid and gives satisfactory results. It is also useful as a qualitative test. It is only necessary to shake the chloroform after titration with a small quantity of water, to separate and filter the aqueous solution, and add ferric chloride or apply Mohler's test.

E. G.

Apparatus for the Estimation of the Melting Points of Fats. LEO VON LIEDERMANN (*Zeitsch. Nahr. Genussm.*, 1911, 22, 294—295).—The apparatus consists of a U-tube, the lower portion of which is filled with mercury; the fat under examination is poured in a molten condition into one of the limbs of the tube, and allowed to solidify. This limb is closed by a cork through which pass a thermometer, a platinum wire, and the stem of a small funnel; the bulb of the thermometer and the lower end of the wire are forced into the layer of fat, but do not touch the mercury. The other limb of the tube carries a platinum wire in contact with the mercury. A further quantity of mercury is now poured through the funnel so as to form a layer above the fat, and the tube is heated gradually in a water-bath after the two platinum wires have been connected with an electric bell and battery. When the fat begins to melt, the mercury above it passes downwards and causes the bell to ring by establishing a

ABSTRACTS OF CHEMICAL PAPERS.

between the two wires. This point is taken as the "true melting point" of the fat; the point at which the fat becomes perfectly solid is the "highest melting point."

W. P. S.

Estimation of Fat in Feeding-stuffs by means of Trichloroethylene. R. NEUMANN (*Chem. Zeis.*, 1911, 35, 1025—1026).—Trichloroethylene is recommended as a solvent in the estimation of fat in such substances as oil-cakes, etc. Five grams of the sample are shaken for thirty minutes with 100 c.c. of the solvent, the mixture is then filtered, 50 c.c. of the filtrate are evaporated, the residue is dried, and weighed. The results obtained agree well with those yielded by the ordinary method of extraction with ether (compare Abstr., 1910, ii, 647).

W. P. S.

Detection of Thujone (Tanacetone) in Absinthe. H. ENZ (*Chem. Zentr.*, 1911, ii, 576, 1556; from *Schweiz. Woch. Chem. Pharm.*, 1911, 49, 337—440; 507—508).—For the detection of tanacetone in any liqueur, a portion of the latter is boiled with the addition of aniline phosphate, in order to destroy aldehydes, and then diluted with water until the alcoholic strength is reduced to 30% by volume. Five hundred c.c. of the solution are fractionally distilled, the distillate being collected in nine portions of 25 c.c. each. In the case of absinthe itself, it is better to reduce the alcoholic strength to 50% and to collect 50 c.c. quantities of distillate. The portions of distillate, numbers six and seven, are then tested for the presence of tanacetone as described by Duparc (Abstr., 1909, ii, 188); these fractions are free from aldehyde, aniseed oil, and fennel oil. As certain essential oils, such as *Ol. hyssopii*, *culami*, *verbenae*, and *sabinae*, and also carvone and citral, give the same reaction as tanacetone, a liqueur which yields a positive reaction does not necessarily contain absinthe; a negative reaction, however, indicates the absence of absinthe.

The second paper is a reply to Philippe and Fellenberg (below).

W. P. S.

Detection of Thujone (Tanacetone) in Absinthe. ENZ, PHILIPPE and THEODORE VON FELLENBURG (*Chem. Zentr.*, 1911, ii, 597; from *Schweiz. Woch. Chem. Pharm.*, 1911, 49, 418—420).—The authors point out several errors in Enz's process (preceding abstract).

W. P. S.

Tannin Solutions. GEORG GRASSER (*Collegium*, 1911, No. 443, 448—52).—The author gives (in tabulated form) the results of treating various concentrations of tannin solutions with the following reagents (1) Five % solution of tartar emetic; (2) the same with addition of ammonium chloride; (3) with ammonium acetate; (4) a solution containing 5% tartar emetic, 5% sodium chloride, 5% sodium hydrogencarbonate, and 20% sodium acetate; (5) ammoniacal zinc acetate solution; (6) an N/50 iodine solution, and (7) a solution of 10% sodium chloride and 1% gelatin. In very dilute solutions (0.006—0.001 iodine gives a violet coloration, whereas the others have ceased to give any appreciable reaction, but this varies somewhat with tannin obtained from different barks.

F. M. G. M.

General and Physical Chemistry.

Molecular Refraction of Azo-compounds. HENRI DUVAL (*Compt. rend.*, 1911, 153, 874—875).—The position of substituents in the azo group has very little effect on the molecular refraction of aromatic azo-compounds. In the case of azobenzene the index varies somewhat with the solvent, and increases slightly with the temperature; superfusion has without effect. Adopting Brühl's value for nitrogen, the calculated numbers for the molecular refraction with the *D*-sodium and α -hydrogen lines are lower than the actual values found with the lithium line, 1.6705.

W. O. W.

The Negative Pole Spectrum of Oxygen. F. CROZE (*Compt. rend.*, 1911, 153, 664—665).—A new band, nearer the red than those previously recorded, has been detected in the negative pole spectrum of oxygen. It became visible when the negative electrode had the form of a hollow cylinder, and was resolved into eleven components all diffuse towards the violet. The wave-lengths and relative intensities are given; the most intense component is at λ 6791.3 Ångström units. The five bands now known show a general resemblance to those of nitrogen, but the series cannot be represented by the usual formula.

W. O. W.

The Green Carbon Band $\lambda=5635$. RUDOLF KOMP (*Zeitsch. phys. Chem.*, 1911, 10, 117—134).—An arc generated by a current of 2—25 amperes at 220 volts was employed as source of light. The intensity of the green carbon band, which appears to be emitted most strongly by that portion of the arc which is in immediate contact with the electrodes, increases with the strength of the current and with the extent to which hissing takes place. In order to avoid cyanogen lines, the arc was surrounded by an atmosphere of carbon dioxide.

The wave-length measurements were made by means of a large concave grating of 6.5 metres radius and 20,000 lines to the inch, and are expressed in 0.001 Ångström units.

The green carbon band is similar in constitution to the second carbon band, which has been previously examined in detail, and this similarity indicates that the two bands have a common origin. Starting from the first head of the band, the spectrum exhibits two series of strong lines and two similar series of finer lines. Between the individual members of these series are a number of relatively weak triplets which seem to fall into six different series. The wave-lengths

of the lines of these various series are discussed in reference to the validity of Deslandree's first and second laws.

H. M. D.

Separation of Spectra in Compound Gases. G. STEAD (*Phil. Mag.*, 1911, [vi], 22, 727—733. Compare this vol., ii, 830).—Further experiments are described in which the author has compared the anode and cathode spectra in the discharge through tubes containing various gases.

VOL. C. ii.

taining ethane, ethylene dichloride, ethylidene dichloride, carbon tetrachloride, mercury dimethyl, aniline, ethyl ether, methyl sulphide, and chloroform. The differences between the two spectra indicate that these are determined by the electro-chemical character of the component elements and by the inequality of temperature and of potential gradient at the two electrodes. It is supposed that the discharge of positive ions takes place throughout the negative glow; whilst negative ions lose their charges in the positive column. H. M. D.

Spectra of the Electrodeless Ring Discharge in Certain Gases. H. DONALDSON (*Phil. Mag.*, 1911, [vi], 22, 720—727).—The influence of pressure, variation in the length of the spark-gap, and frequency of sparking has been investigated for the electrodeless ring discharge in hydrogen, air, carbon dioxide, carbon monoxide, oxygen, and argon. As in the case of the discharge between metal electrodes, it is found that the spectrum is dependent on the intensity of the electric field, although the results are not quite parallel.

In oxygen the continuous spectrum appears at the lowest intensities in the case of the ordinary discharge, whereas the ring discharge intensity lies between those which give rise to the compound line and the band spectra.

In carefully purified carbon monoxide the Swan spectrum appears at high intensities, whereas weak electric fields give rise to the carbon band spectrum only. It is suggested that these two spectra may be the high and low intensity spectra of the same substance.

The ring discharge in nitrogen and air shows no trace of the negative band spectrum, the change from the positive band spectrum to the line spectrum taking place directly. The general results agree with those found for electrode discharge in that the positive band spectrum appears to be brought about by the weakest fields and the line spectrum by stronger fields. H. M. D.

Resolution of the Spectral Lines of Lanthanum and Cobalt in the Magnetic Field. STEPHAN RYBÁN (*Physikal. Zeitsch.*, 1911, 12, 889—900).—From observations of the influence of a strong magnetic field on the lines in the spark spectrum of lanthanum, it is found that the Zeeman effect for certain lines is very similar to that observed in the case of yttrium. The wave-lengths of those lines which exhibit close resemblance in their magneto-optical properties are as follows: La 4575.08, Y 3818.49; La 3921.71, Y 3628.89; La 4946.60, Y 3628.89; La 3381.10, Y 4398.21; La 3153.08, Y 4199.46; La 4986.99, Y 3950.51; La 3303.26, Y 4358.91 and 3195.80. The resolution in the last group of these lines is identical with that observed for the barium line $\lambda = 5997.4$.

The data for cobalt show resolution of the lines 3385.39, 3388.32 and 3463.01 into ten components, of 3495.89, 3550.75, and 3704.32 into eight, of 3491.51, 3561.06, and 3941.05 into seven, of sixteen lines into four, and of 106 lines into three components. H. M. D.

Distribution of Chemical Elements in the Earth's Crust. WLADIMIR J. VERNADSKY (*Bull. Acad. Sci. St. Petersburg*, 1911, [vi], 1007—1018).—[With B. A. LINDENER and E. D. REVUTSKY.]—Table

are given similar to those already published (Abstr., 1910, ii, 1013), and including the results obtained during 1910. In addition to the occurrence of cesium, rubidium, thallium, indium, boron, etc., in a large number of minerals, that of copper, calcium, strontium, etc., in various artificial products, such as vanadium oxide, yttria, etc., is noted.

T. H. P.

The Influence of Neutral Gases on the Absorption of Sodium Vapour. KARL FREDENHAGEN (*Physikal. Zeitsch.*, 1911, 12, 909-911).—The non-appearance of the principal series lines of the alkali metals when their salts are introduced into the hydrogen chloride flame has been explained by Franck and Pringsheim (this vol., ii, 574) as due to the small concentration of free electrons. With the object of throwing further light on the nature of the process which gives rise to the principal series lines, the author has investigated the influence of inert gases on the absorptive capacity of sodium vapour. The admission of hydrogen, nitrogen, carbon dioxide, and helium to sodium vapour at 400° increases the absorptive power to a large extent, the magnitude of the influence of the different gases being approximately the same. In each case the intensity and breadth of the *D*-lines increases as the concentration of the admixed inert gas is increased.

Interferometer observations with the yellow helium and mercury lines indicate that the number of absorbing particles in the sodium vapour decreases in the presence of the inert gases. This change in the number of the absorbing particles is correlated with the increased ionisation which has been found (compare this vol., ii, 571) to accompany the admixture of sodium vapour with small quantities of inert gases.

H. M. D.

Absorption of Light by Silver Hydrosols. NILS PHILBLAD (*Zeitsch. Chem. Ind. Kolloide*, 1911, 9, 156-158).—The absorption of light by colloidal silver solutions of different degrees of dispersity has been examined for the mercury lines $\lambda = 404.7, 435.9, 491.6, 546.1, 579, 622, \text{ and } 690$. As the size of the particles is gradually increased, the maximum value of the extinction-coefficient moves towards the red end of the spectrum. For all solutions there appears to be, however, a more strongly developed maximum in the ultra-violet region.

From experiments with solutions of variable concentration, it is found that the light absorption takes place in accordance with Beer's law.

H. M. D.

Absorption Spectra. IV. Influence of the Solvent and of Dilution on the Validity of Beer's Law. ALFRED W. STEWART and ROBERT WRIGHT (*Ber.*, 1911, 44, 2819-2826).—The absorbing power of a solution of iodine in alcohol increases at a greater relative rate than corresponds with the increase in dilution of the solution, probably because of the formation of an additive compound between iodine and alcohol. The opposite is the case with solutions of iodine in water; with increasing dilution the solutions become relatively more transparent.

An explanation of the behaviour of aqueous solutions can be given on the assumption that an oxonium derivative is formed which ionises when the solution is diluted; the ionised iodine atom causes practically no absorption, in contradistinction to the alkyl iodides, which show a strong selective absorption (compare Crymble, Stewart, and Wright, *Abstr.*, 1910, ii, 470).

Solutions of iodine in mixtures of water and alcohol can be made more transparent by increasing, and less transparent by decreasing, the proportion of water.

An alcoholic solution of *p*-nitrotoluene behaves similarly to one of iodine, and in this case, also, is the formation of an additive compound possible. The addition of water, however, has simply the ordinary effect of dilution, and does not make the solution relatively more transparent, there being no possibility of an ionisation occurring.

Azobenzene is an indifferent substance, which neither forms additive compounds, nor is capable of ionisation, so that it conforms to Beer's law both in alcoholic and in aqueous-alcoholic solution. T. S. P.

Ultra-violet Absorption Spectra of Nitro-compounds. NICOLAI D. ZELINSKY and N. A. ROSANOFF (*J. Russ. Phys. Chem. Soc.*, 1911, 43, 1173—1183).—The absorption spectra of various nitro-compounds (including nitromethane and nitroethane, for which Baly and Desch [*Trans.*, 1908, 93, 1747] and Hadley [*Abstr.*, 1908, i, 325] obtained divergent results) and their alkali salts have been investigated in the ultra-violet by Hartley's method (*Trans.*, 1885, 47, 685).

With nitromethane, in either aqueous or alcoholic solution, the absorption increases considerably in passing from the free nitro-compound to its sodium salt, corresponding with the unsaturated isonitro-derivative.

With nitroethane, the selective absorption is changed into continuous absorption on the formation of the sodium salt. The character of the absorption is the same with nitromethane and nitroethane, but in the latter the absorption band is displaced towards the visible part of the spectrum, probably owing to the influence of the molecular mass; the maxima in the two cases are at $1/\lambda = 3720$ and $1/\lambda = 3640$ respectively. These results confirm those of Baly (*loc. cit.*).

α -Nitropropane gives similar absorption curves, the selective absorption of the free compound being displaced still more towards the visible spectrum, the maximum being at $1/\lambda = 3600$. β -Nitropropane gives a greater general absorption in the free state, and greater selective absorption in the form of sodium salt, than in the case with the α -compound, the maximum lying at $1/\lambda = 3500$; the increased absorption is here evidently due to the yellow colour of the freshly-prepared sodium salt in either aqueous or alcoholic solution.

With tetranitromethane, the selective absorption is still more towards the visible portion of the spectrum, the maximum being at $1/\lambda = 2975$.

ω -Nitrophenylmethane gives a curve similar to those of the other primary nitro-compounds, the maximum being at $1/\lambda = 3465$; the characteristic behaviour of the aromatic series is not shown.

With α -nitrocyclohexylmethane, selective absorption occurs only with the salts, the maximum being at $1/\lambda = 3440$; the free compound shows marked general absorption.

Free nitrocyclohexane shows two absorption bands with maxima at $1/\lambda = 3500$ and 3720 ; the salts exhibit general absorption. The same is the case with 1-nitro-1-methylcyclohexane, the maxima being at 3350 and 3740 . 1-Nitro-1-methylcyclopentane gives, however, only one absorption band, with a maximum at $1/\lambda = 3570$.

These results confirm the view that the absorption is conditioned, besides by other influences, also by the molecular mass of the compound.

The introduction of nitro-groups into aliphatic compounds causes a considerable increase in the general absorption, along with which selective absorption also appears. The latter is a consequence, not of a quinonoid grouping (compare Hedley, *loc. cit.*), but of the vibration between the elements of the molecule (see Baly and Collie, *Trans.*, 1905, 87, 1333), resulting from the residual valency of the nitro-group. There should hence be no difference in general character between the absorption curves of mono- and dinitro-aliphatic compounds; this is contrary to the results of Hedley, who found no selective absorption for nitromethane, an observation which the author is unable to confirm.

The introduction of nitro-groups into the molecules of hydroaromatic compounds causes marked displacement of the absorption towards the visible part of the spectrum, and also the appearance of absorption bands not observed with the hydrocarbons themselves.

The introduction of nitro-groups into the benzene ring evidently neutralises the residual valency of the nucleus, and weakens the manifestation of molecular vibrations, since the number of absorption bands diminishes. In this respect, the hydroaromatic compounds are similar to the aliphatic compounds, owing to the absence of residual valency.

The conclusion is drawn that the magnitude of continuous and selective absorption is closely connected with the degree of tension prevailing in the molecule. This may depend on the extent of unsaturation of the compound itself, and also on the degrees of tension of its constituent elements.

T. H. P.

Photosensitive Antimonite [Stibnite] Cells. WILLIAM SEBASTIAN GRIPENBERG (*J. Amer. Chem. Soc.*, 1911, 33, 1761—1762).—Jaeger (Abstr., 1907, ii, 923) has shown that light has a powerful influence on the electrical conductivity of stibnite. The author has constructed a highly sensitive cell which consists of a lamella of natural stibnite about 0.3 mm. thick, pressed against a glass electrode plate covered with a large number of very fine electrodes of gold or platinum foil, parallel to one another and about 0.067 mm. apart. The width of this grating is 3×4 mm., this having about 14 electrodes per sq. mm. The required pressure on the lamella is effected by a small screw-press, into the frame of which insulated wires are fitted. The wires end in small elastic bars, which pinch the electrode-plate and make metallic contact with the bars of the grating.

Such cells have a resistance of from 10^4 to 5×10^4 ohms. The presence of a small oil-lamp in the neighbourhood of the cell causes the resistance to fall to 10% or even 1% of its original value. During the passage of the current, the cells are very sensitive to atmospheric influences, and must therefore be enclosed in vaselin. They can be used satisfactorily for an E.M.F. of 30 volts, but if used with very high voltages they are liable to get out of order.

K. G.

Absorption and Secondary Radiation of Cathodic Rays. F. BUTAVAND (*Ann. Chim. Phys.*, 1911, [viii], 24, 421—432. Compare Schmidt, Abstr., 1910, ii, 7, 378; Schmidt and Cermack, Abstr., 1910, ii, 918).—When a group of β -rays falls on a plate of an elementary substance $I = I_0 e^{-\lambda x}$, where I is the intensity of a saturating current, I_0 that of the emergent group of rays, and λ the coefficient of absorption. λ is not proportional to the density, ρ , of the element. The expression $\lambda/\rho = kP^{1/3}$, where P is the atomic weight, gives values of k which fluctuate about a mean 1.85 when values of λ , ρ , and P are inserted for the various elements. Taking any one of the groups of the periodic table, the differences between 1.85 and the values of k found for the constituent elements are alternately positive and negative, so that k is a periodic function of the valency V . Substitution of values in the expression $\lambda/\rho = 1.88P^{1/3} (1 \pm 1/10 \cos \omega V/8)$ gives values approximating to those calculated. For compounds, an analogous expression holds, namely, $\lambda/\rho = h/p^{1/3}$, where p is the molecular weight and h a coefficient which is approximately constant for analogous compounds. For applications of this the original should be consulted.

β -Rays falling on a plate of an elementary substance give rise to secondary β -rays in all directions, and the intensity η of these secondary rays varies with the nature and substance of the plate, and increases with the atomic weight P of the element. Substitution of values in the expression $\eta = k'P^{1/3}$ shows that k' is approximately equal to 10%.

T. A. H.

Radioactive Properties of High Temperature Flames. HARRY CARTER (*Phil. Mag.*, 1911, [vi], 22, 805—816).—To ascertain whether atomic disintegration takes place in reactions which are accompanied by the liberation of large quantities of energy, the author has examined the electric arc, the spark, and the oxy-hydrogen and oxy-acetylene blowpipe flames for β -radiation. The apparatus was arranged so as to avoid temperature variations of the electroscope and the presence of ionised air in its neighbourhood. In no case could any appreciable difference be detected between the rate of leak when the electroscope was exposed to the source and when shielded from its action.

H. M. D.

Radiation in Explosions of Coal Gas and Air. W. T. DAVIS (*Phil. Trans.*, 1911, A, 211, 375—410).—Measurements have been made of the radiation emitted during the explosion and subsequent cooling of mixtures of coal-gas and air. By the use of screens of fluorite, quartz, glass, and water for the bolometric apparatus, it was possible to estimate fairly accurately the total radiation emitted by the gas, the approximate proportions emitted by water vapour and by

carbon dioxide, and also the amount of energy in the luminous radiation.

The bolometric records show that, for different gas mixtures at atmospheric pressure, the total heat lost by radiation to the walls of the vessel up to the moment of maximum pressure is approximately proportional to the product of the third power of the maximum absolute temperature by the time of explosion. The total radiation lost during the explosion and subsequent cooling is about 25% of the heat of combustion of the gas present in the explosion chamber. The radiation in the initial stages of cooling is a function of the time interval from ignition as well as of the temperature. The rate at which the radiation is emitted is a maximum some time before the attainment of maximum pressure, and probably occurs at the moment when the flame fills the explosion chamber. Weak explosive mixtures radiate very much more in the initial stages of cooling than stronger mixtures do when these have cooled to the same temperatures.

The total heat radiated by carbon dioxide is about twice as large as that radiated by an equal volume of water vapour at the same temperature.

When explosive mixtures of the same strength, but of different densities, are compared, it is found that the ratio of the heat which is lost by radiation up to the moment of maximum pressure to the heat of combustion decreases as the density increases, but denser mixtures emit much more strongly at the moment of maximum pressure and in the initial stages of cooling.

In the second part of the paper an account is given of experiments relating to the diathermancy and emissive power of the hot gaseous mixtures after explosion.
H. M. D.

The Distribution of the Intervals of Emission of the α Particles of Polonium. (Mme.) MARIE CURIE (*Le Radium*, 1911, 8, 354—356).—The results obtained confirm those of previous observers (Rutherford and Geiger, *Abstr.*, 1910, ii, 917; Marsden and Barratt, *Proc. Phys. Soc.*, 1911, 23, 367). From a series of curves, obtained by means of the ionisation method in which the excursions of the electrometer needle are recorded on a moving photographic film, comprising 1080 intervals, it was found that the number of intervals, n , comprised between t and $t + \theta$, where θ represents a fixed time, varies according to an exponential law, $n = n_0 e^{-t/\tau}$, where τ is the mean interval, and $n_0/\theta = N/\tau$, N being the total number of intervals. This is the same law as applies to the free path of the molecules of a gas, the mean free path corresponding with the mean interval between the emissions.
F. S.

The Variation of the Activity of Some Radioactive Substances with Time. (Mme.) MARIE CURIE (*Le Radium*, 1911, 8, 353—354).—The α -rays of uranium oxide have been kept under observation for four years. The means of the measurements taken in each year agree within 0.5%, and the conclusion may be drawn that the activity has remained constant. The β - and γ -rays from a salt of barium containing radium, previously purified from radio-lead and its products, and contained in a thin-walled glass tube covered with aluminium foil, have been observed for twenty months. The tube forms the central electrode in a cylindrical ionisation chamber, and a

correction is introduced for the changes of density of the air. An increase of the radiation amounting to about 2.5% per year has been observed, which is doubtless due to the formation of radio-lead. A preparation of Debierne's actinium many years old has been studied in the same way. The measurements are unaccountably irregular, but indicate a diminution of the penetrating rays in three years amounting to 10% of the initial activity. Either there must exist between actinium and radioactinium an intermediate substance of long-life giving β -rays, initially present in excess, or the period of average life of actinium is only of the order of thirty years. In the latter case the relation between actinium and the other radio-elements of uranium minerals ought to be capable of elucidation. Radio-lead submitted to a crystallisation of the chloride to remove radium-X and -F, and containing initially radium-D only, has been studied for five years. The penetrating rays attained the maximum in one month, the period of radium-E being 4.7 days, and the α -rays attained the maximum in two years. Both types of radiation remained fairly constant during the third year. During the fifth year a regular decay of the α -rays occurred, amounting to about 5% in 440 days. This would correspond with a period of average life of radium-D of about twenty-five years. The β -ray measurements are less precise, but indicate about the same rate of decay. All measurements have been effected by means of the quartz piézo-électrique, which remains, when properly mounted, absolutely constant, and is very suitable for these measurements. F. S.

Thorium and its Products of Disintegration. MAY SKEEL LESLIE (*Le Radium*, 1911, 8, 356—363).—The results confirm those of other workers as to the chemical nature of mesothorium. The material employed was thorite containing 40% of thorium oxide and 0.73% of uranium. In the electroscope employed the different values for the separate α -ray producing members of the series were: thorium 5.5%, radiothorium 9.4%, thorium-X 12.2%, emanation 43.4%, thorium-A 12.2%, thorium-B 12.2% (old nomenclature). This accords with the view that the emanation gives four α -particles per atom disintegrating, and that the α -rays due to thorium itself have a very low velocity corresponding with a range of only about 2 cm. The activity of oxide of thorium freshly separated from thorium decays at a rate which indicates that the period of radiothorium is only three or four months. F. S.

The Amount of Radium Emanation in the Soil and its Escape into the Atmosphere. JOHN JOLY and LOUIS B. SWIRE (*Sci. Proc. Roy. Dubl. Soc.*, 1911, 13, 148—161).—Observations have been made in the vicinity of Dublin, during the months of April and May, 1910, of the amount of radium emanation in the soil at various depths and on the amount exhaled per hour from the surface. The period covered began with wet and stormy weather and ended with a long spell of fine settled weather. The observations are in agreement with the view that the influence of rain is to choke the capillaries of the soil, retarding the escape of the emanation and therefore increasing the amount in the soil, whilst reducing that in the air. At depths

below the surface of from 25 to 250 cm., the relative amount of emanation in the air in the soil was usually many thousand times that in the atmosphere. A very rapid escape of emanation from the soil was established, and it is considered probable that this exhalation is the chief, if not the only considerable, source of the emanation in the atmosphere.

F. S.

Quantity of Radium Emanation Liberated From One of the Springs at Columbières-sur-Orb (Hérault). JACQUES DANNE and VICTOR CRÉMIER (*Compt. rend.*, 1911, 153, 870—871).—This spring evolves gas at the rate of 43,000 litres per day, with an amount of radium emanation corresponding with 860 mg.-minutes per twenty-four hours. This unusually large amount of emanation is readily available in an active form, since the gas contains 95% of easily removable carbon dioxide.

W. O. W.

The Radioactivity of Mineral Springs. ERICH EBELER and M. FELLNER (*Zeitsch. anorg. Chem.*, 1911, 72, 233—301).—The gas obtained from the Max mineral spring of Dürkheim contains 6.1×10^{-6} cubic mm. of radium emanation per litre. The spring evolves 50 litres of gas per hour. The activity of the sediment is, as usual, variable, and about one-half of the activity disappears when the sediment is gently warmed. An estimation of the radium present by Strutt's method gives, for two samples of sediment collected at different times, 3.03×10^{-10} and 1.76×10^{-10} gram radium per gram of sediment. Other radioactive substances, including radiothorium, are also present.

An analysis of the sediment, dried at 106° , shows that it contains 45.5% SiO_2 , 9.9% residue insoluble in hydrofluoric acid, 10.7% Al_2O_3 , 7.1% CaO , 15.7% Fe_2O_3 , and 2.5% Mn_2O_3 , with small quantities of other substances. Sulphates are absent, and carbonates present only in minute quantity. Lead is present to the extent of 0.1%. Thorium and uranium are absent. The proportion of potassium increases with the time of agitation with the water, whilst that of sodium is unchanged. When treated with hydrochloric acid, 91% of the radium remains in the insoluble residue, being adsorbed by colloidal silica. Boiling hydrochloric acid extracts a substance from the sediment, which crystallises in polyhedral, yellow leaflets, 600 grams being obtained from 10 kilograms of sediment. This quantity yielded 33 grams of potassium nitrate, of similar activity to ordinary potassium salts.

The water itself contains 0.97×10^{-10} gram of radium per litre. The mother liquor obtained in the commercial crystallisation of salts from this water is distinctly radioactive, the activity being due to radium. Determinations of the activity of the sediment and of the mother liquor give a value of 0.78×10^{-10} gram of radium per litre of the original water, in good agreement with the foregoing.

Details are given of the chemical methods of investigating these and similar products.

C. H. D.

The Radioactivity of the Mineral Springs of Tyrol. III. MAX BAMBERGER and KARL KRÜSE (*Monatsh.*, 1911, 32, 797—813. Compare Abstr., 1910, ii, 570).—A table is given of numerous

determinations of the activity in Maché units of mineral springs in Tyrol. The table contains details also of the temperature of the spring and of the rock in which it occurs.

F. S.

The Radioactivity of the Air Over the Open Sea. CAN RUXOZ; (*Chem. Zentr.*, 1911, ii, 786; from *Nachr. K. Ges. Wiss. Göttingen, Math.-physikal. Klasse*, 1911, 99—109).—Under similar conditions the induced activity of the atmosphere was found to be about as great in the middle of the Atlantic Ocean as near the coast. In both cases the decay curve for the first two hours is that of radium alone, except that in the middle of the ocean the decay for the first half-hour is somewhat more rapid. After two hours the decay becomes slower, indicating the presence of thorium.

F. S.

The Formation of Positive Ions by Heated Metals. Z. KLEMENSIEWICZ (*Bull. Acad. Sci. Cracow*, 1911, A, 417—424).—The emission of positive ions by electrically heated platinum, palladium, gold, iridium, copper, iron, and tungsten wires has been investigated. From measurements of the leakage current between the wire and a surrounding metal cylinder after different time intervals, decay curves were obtained for new wires, and also for wires which had been heated in a vacuum or left in contact with strongly compressed gases for several hours. In the case of platinum, observations were also made with the metal after anodic and cathodic polarisation.

The experimental data are in favour of the view that the positive ion emission is mainly due to absorbed gases. It is calculated that about 1% of the gas molecules which leave the heated metal are electrically charged. This fraction is approximately constant, and, as a consequence, the number of positive ions will be proportional to the solubility of the gas in the metal under investigation.

Experiments with palladium and iridium, superficially covered with the corresponding oxides, indicate that emission of ions is not an accompaniment of the formation or dissociation of these oxides. On the other hand, tungsten, copper, and iron show emission effects, both during oxidation and reduction.

H. M. D.

Mobility of Positive Ions Produced from Heated Aluminium Phosphate in Gases at Low Pressures. GEORGE W. TODD (*Phil. Mag.*, 1911, [vi], 22, 791—804).—The mobility of the positive thermions from aluminium phosphate has been measured in air, carbon dioxide, sulphur dioxide, methane, and hydrogen at low pressures. As the pressure is lowered, the mobility increases in such a way that the product of pressure and ionic mobility remains approximately constant, but increases much more rapidly than this when the pressure is lowered beyond a certain critical value. This rapid increase may be due to the disintegration of the molecular clusters which form the ions under higher pressures, or to the existence of a positive ion in the free condition for short intervals of time. In air and carbon dioxide the data obtained at the lowest pressures show that the positive charge is carried by particles, the mass of which is smaller than that of the ordinary gas molecules.

Water vapour has only a small influence on the mobility of the positive ion in the region where the inverse pressure law holds, but has a large effect at smaller pressures. Under these conditions, the presence of water vapour causes the mobility to fall below the value which would correspond with the inverse pressure law.

The thermions emitted by heated aluminium phosphate appear to yield by collision with the gas molecules the same ions as are produced by the action of X-rays on the gas.

H. M. D.

Positive Ionisation from Hot Salts. OWEN W. RICHARDSON (*Phil. Mag.*, 1911, [vi], 22, 669—703. Compare Abstr., 1910, ii, 923; this vol., ii, 9, 10).—The nature of the positive ions emitted by heated salts has been further examined by experiments with two different forms of apparatus and observations at different pressures and temperatures. The values obtained for e/m indicate that the positive ions are metallic atoms which are not necessarily atoms of the metal in the salt under examination, but may be due to some other metal present as impurity. In the case of aluminium phosphate strong evidence has been obtained in favour of the view that the observed $e/m = 32$ is due to traces of foreign substance, for when the aluminium phosphate was prepared from ammonia, aluminium chloride, and phosphoric oxide, all of which had been subjected to distillation before use, a product was obtained which only gave about 1/150 of the emission given by Kahlbaum's aluminium phosphate.

In regard to the relative efficiency of different salts in emitting positive ions, it appears that the emissive power increases with the electro-positive character of the metallic constituent and with the volatility of the compounds which appear to be formed from the original substance at the high temperature. A number of facts cannot be satisfactorily explained unless it is assumed that the ionisation is not directly due to the heated salt, but to the action of vapours emitted by the salts on the hot platinum. This is the case for the changes in the emissive power which are observed when the pressure of the gas is altered and for the different effects which are obtained according to whether the salt is supported on a strip of platinum or is contained in a platinum tube.

H. M. D.

Specific Conductivity of Fused Potassium Nitrate. A. H. W. ARN (*Zeitsch. physikal. Chem.*, 1911, 78, 1—23).—The apparatus used was similar to that of Lorenz and Kalmus (compare Abstr., 1907, ii, 430). The thermostat contained fused potassium and sodium nitrates, and the temperatures were measured by means of a carefully calibrated platinum resistance thermometer. The determination of the resistance capacity of the apparatus and the corrections made are described in detail.

Measurements were made at intervals of temperature between 340° and 500° in vessels of common glass, Jena glass, and quartz respectively. The results for the different vessels are in fair, but not in exact, agreement; no satisfactory explanation for the deviations has been found. At high temperatures the conducting values are higher than those found by Lorenz and Kalmus, but are in fair agreement with those of

Goodwin and Mailey (*Phys. Review*, 1908, **23**, 28); at low temperatures, on the other hand, the author's results are lower than those of Goodwin and Mailey. The following numbers show the variation of the specific conductivity with temperature: 0.6334 at 346°, 0.8301 at 400°, 0.9687 at 450°, and 1.1099 at 500°.

Electrical Conductivity of Liquid Sulphur Dioxide Solutions at -33.5° , -20° , -10° , 0° , and $+10^\circ$. EDWARD C. FRASER. *Physical Chem.*, 1911, **15**, 675—697. Compare Abstr., 1909, ii, 557.
—The conductivity of solutions of potassium iodide and bromide, tetramethylammonium iodide, ammonium thiocyanate, ethyl ammonium bromide, and dimethylammonium chloride in liquid sulphur dioxide has been measured, using the apparatus and methods previously described for liquid ammonia.

The conductivity-dilution curves closely resemble those given by liquid methylamine and liquid ammonia. On diluting the saturated solutions, the molecular conductivity rises to a maximum, then declines to a minimum at moderate dilutions, and finally rises continuously to the highest dilutions measured, approaching a maximum value in the normal way.

It is suggested that the high conductivity in concentrated solutions is due to autoionisation of the salt, whereas in dilute solutions ionisation by the solvent comes into play. The initial increase in conductivity on diluting saturated solutions is attributed to the considerable fall in viscosity which more than compensates for the fall in autoionisation. The temperature-coefficient of conductivity is positive for very concentrated and very dilute solutions, whilst for solutions of intermediate concentration the temperature-coefficient is generally reversed. The autoionisation in concentrated solutions and the almost complete ionisation at high dilutions are presumably unaltered by temperature changes which influence the conductivity only through the viscosity. At moderate dilutions the ionisation by the solvent may suffer a marked diminution, with rise in temperature.

It was observed in the course of the experiments that potassium bromide is more soluble in liquid sulphur dioxide the lower the temperature.

R. J. C.

Electrical Conductivity of the System Ferric Chloride-Ammonium Thiocyanate. CORRADO BORGIOVANNI (*Boll. Chim. Farm.*, 1911, **50**, 694—697).—The conductivity of a red solution containing ferric chloride and ammonium thiocyanate is approximately equal to the sum of the conductivities of solutions of the separate salts of corresponding concentrations. The slight diminution in the degree of dissociation which occurs is probably due to mass action between the reacting salts, and consequent formation of a small number of undissociated molecules. Indeed, if the salts are taken in equivalent proportions, and in solutions sufficiently dilute to ensure complete dissociation, the specific conductivity of the red solution becomes very nearly equal to the sum of the separate conductivities.

These results confirm Magnanini's interpretation (Abstr., 1891, 1150) of this reaction (compare also Abstr., 1907, i, 833; 1908, i,

1904, and are not in agreement with the view advanced by Tarugi (Abstr., 1905, i, 176). T. H. P.

The Electric Vacuum Furnace. OTTO GOECKE (*Metallurgie*, 1911, 2, 667—676).—The carbon tube electric vacuum furnace (Ruff and Goecke, this vol., ii, 897) has been further improved by the addition of a second carbon tube, enclosing the first and insulated from it by means of magnesia, to lessen the loss of heat by radiation. The crucible may be introduced and removed without removing the heating tube. A series of determinations of melting points in this furnace by means of the Wanner optical pyrometer gives results in good agreement with previous observations. A few new determinations have been made. Alumina has m. p. 2020—2035°, either in a vacuum or in nitrogen. Lime has not been fused in a vacuum, but in nitrogen it melts at 1990°, owing to a chemical reaction. Magnesite boils, without melting, at 2029°/7 mm., but volatilisation begins in nitrogen at atmospheric pressure at 1805°. C. H. D.

Differences in Potential of Apparent Contacts between a Metal and Electrolytic Solutions. J. GUYOT (*Compt. rend.*, 1911, 153, 867—869. Compare Abstr., 1908, ii, 656).—The apparent difference in potential established by ionising air between the surfaces of a salt solution and a metal plate above it varies with the logarithm of the ionic concentration of the solution. For solutions of the alkali chlorides, using reversible electrodes, the difference of potential is given by the expression $V = V_0 \pm 0.053 \log c.1/p$. This is analogous to the Helmholtz formula for the electromotive force of a couple consisting of two reversible electrodes immersed in a liquid.

W. O. W.

Polarisation of Solid Electrolytes. [The Phenomena of Passivity.] FRITZ HABER and J. ZAWADZKI (*Zeitsch. physikal. Chem.*, 1911, 78, 228—243).—When solid compressed silver salts (the chloride, bromide, iodide, and sulphate were used) are electrolysed between plates of silver, considerable polarisation occurs, and this is the greater the lower the temperature. With silver sulphate at room temperature, for instance, an *E.M.F.* of polarisation of 0.312 volt was observed two minutes, and 0.125 volt twenty minutes after breaking the current. At -80° a polarisation *E.M.F.* of 1.562 volts was observed one minute after breaking the current. Salts which have been kept compressed for some time give higher values than pastilles freshly prepared. By means of experiments with other electrodes it is made probable that the polarisation occurs only at the anode.

These results cannot be reconciled with the usual assumption that the primary change at the anode is the formation of silver ions from metallic silver. It is suggested that the transport of the current from solid electrolyte to anode is effected by the passage of electrons with simultaneous formation of oxidising substances (silver persulphate from silver sulphate, free halogen from halogen ions). These oxidising substances then attack the silver anode, this secondary

reaction being greatly retarded by cooling. It is probable that the mechanism is the same in aqueous solution, but in this case the discharged ion in presence of the solvent reacts rapidly with the electrode. These results may have an important bearing on the phenomena of passivity. G. S.

Galvanic Elements with Carbon Anodes. P. BUCHHEIM (*Zeitsch. Elektrochem.*, 1911, 17, 851—877).—This is a very detailed investigation of the Jacques cell and of several modifications of it. The separate potentials of carbon on the one hand, and of a number of metals on the other, in fused sodium hydroxide are determined over a considerable range of temperature. The potential of carbon in fused sodium hydroxide referred to the calomel electrode is about 1 volt at 370°, and increases by 0.00184 volt per degree. The addition of small quantities of sodium nitrate or perchlorate diminishes the potentials. Permanganate has no effect, since manganate is always present. The potentials in fused mixtures of alkali carbonates are smaller by about 0.8 volt.

The metals iron, nickel, cobalt, silver, copper, constantan, gold, and platinum all become passive in fused sodium hydroxide, and give very exactly the same potentials. These are 0.5 volt at 550°, with a temperature-coefficient of 0.00096 volt per degree between 340° and 650°.

The observed *E.M.F.*'s of the Jacques cells (carbon | fused sodium hydroxide | passive metal) were at 350°, 0.633 volt; at 450°, 0.722 volt; at 550°, 0.804 volt; at 650°, 0.875 volt. These numbers agree well with those calculated from the separate potentials.

The polarisation of the electrodes is then studied. When the cell is yielding a current, the carbon is the anode and the passive metal the cathode, hence the anodic polarisation of the carbon and the cathodic polarisation of the metal are alone of practical interest.

Carbon is readily polarised anodically, a current of 0.06 ampere per sq. cm. reducing its potential by about 0.5 volt at 395°. The addition of sodium nitrate, perchlorate or chlorate diminishes the polarisation considerably, and the latter does not reduce the potential, but they all decompose about 400°, and are consumed. The depolarisation produced by the addition of selenium or tellurium to the electrolyte is of a different kind. The addition of 5% of selenium reduces the polarisation to very small values, and the effect is permanent. Neither selenite nor selenates have this effect; it is therefore ascribed to the presence of a selenide. Tellurium appears to be even more active.

In fused sodium hydroxide, silver and platinum give almost the same cathodic polarisation curves, whilst iron and nickel are much more strongly affected, probably because they become active. The most effective depolariser is sodium peroxide.

When carbon rods are used as anodes in fused sodium hydroxide to which 3% of selenium has been added, their loss of weight varies between 77 and 90% of that calculated, on the supposition that the electrochemical equivalent of carbon is 3.

As Haber had already observed, the Jacques cell gives a small and

constant *E.M.F.* if the electrolyte is free from manganate. This is confirmed using fused lithium hydroxide as electrolyte in presence of a manganate; the *E.M.F.* is the same as with sodium hydroxide. A number of cells with aqueous solutions of sodium hydroxide containing a little potassium permanganate were also measured at temperatures down to 95°. Their *E.M.F.*'s lie on the continuation of the curve obtained with the fused electrolyte at higher temperatures. Above about 650° the *E.M.F.* of the cells falls off rapidly.

A number of cells of different types were tried at high temperatures; most of these gave small and inconstant *E.M.F.*'s. Elements of the type carbon | fused boron trioxide | platinum, in which oxides of iron, nickel, cobalt, silver, or copper were added to the electrolyte gave *E.M.F.*'s between 1000° and 1300° of as much as 1 volt.

T. E.

Electrical Properties of Alkali Metals, Rhodium, and Iridium. WITOLD BRONIEWSKI and L. BLACKSPILL (*Compt. rend.*, 1911, 153, 814—816. Compare *Abstr.*, 1910, ii, 821; Bernini, *Abstr.*, 1908, ii, 255).—The alkali metals were of greater purity than those employed by other observers, and were distilled in a vacuum. The following expressions give the thermoelectric powers when copper is the second metal, for the temperature interval 0° to -183°. Cs + 0.66 - 0.0010*t*, Rb - 8.26 - 0.0302*t*, K - 11.33 - 0.0376*t*, Na - 4.16 - 0.0144*t*. In the case of caesium and rubidium, the variation of thermoelectric power with temperature was also registered photographically, using a Le Chatelier galvanometer. The curve for caesium shows a break in the neighbourhood of the melting point of the metal, whilst that for rubidium shows an angular point.

Similar measurements were made with rhodium and iridium, using lead as the second metal. For the temperature interval -78 to -100°, the values for the thermoelectric powers are given by the expressions: Rb + 2.17 + 0.0005*t*, Ir + 2.44 - 0.0014*t*. At 80°, rhodium appears to undergo a molecular transformation analogous to that of copper, the electrical resistance being much below the expected value.

W. O. W.

Thermoelectric Forces in the Transition from the Solid to the Liquid State of Aggregation. PAUL CERNAK and HANS SCHMIDT (*Ann. Physik*, 1911, [iv], 38, 575—588. Compare Koenigsberger and Weiss, this vol., ii, 578).—The variation of the thermoelectric potential of the elements tin-constantan, tin-iron, and cad-constantan with temperature has been examined at temperatures above and below the melting points of tin and lead. In each experiment two junctions were employed, one of these being kept at a constant temperature below the melting point, whilst the other was slowly heated or allowed to cool, so as to cause the tin or lead to change its state of aggregation. Potential and temperature measurements were made at suitable intervals, and curves have been constructed to show the connexion between thermoelectric potential and the difference between the temperatures of the two junctions. From the results thus obtained, it appears that the change from solid

to liquid is not accompanied by any break in the thermoelectric potential, or by any alteration in the temperature-coefficient of the thermoelectric effect.

H. M. D.

Anodic Behaviour of Nickel in Presence of Chromous Salts. C. Russo (*Gazzetta*, 1911, 41, ii, 101—109. Compare also vol., ii, 181).—The theory that the anodic polarisation of nickel is due to the formation of a solid solution of oxygen at its surface does not exclude the possibility of polarisation even in a solution containing a strong reducing agent, because an oxidising layer can form in the vicinity of the electrode, and there is nothing but the diffusion of the reducing substance to prevent the oxidation of the electrode in consequence. Accordingly, the author finds that the presence of a chromous salt makes it more difficult for nickel to attain to the passive state, but does not prevent its doing so. To bring the condition about in a short time, a much stronger current is required than in the absence of a chromous salt, but if the current is then diminished, no loss of passivity is observed. The presence of the reducing agent also modifies but slightly the polarisation values. Further experiments have shown that the free acetic acid present in the solution containing the chromous salt used in the above electrolysis does not affect the polarisation in any way. This is due to its not taking part in the electrolysis, for in a solution of sodium acetate and acetic acid the polarisation does not follow the logarithmic law, whilst if this same solution contains sodium sulphate the logarithmic law is again valid.

R. V. S.

The Flame Arising from the Nitrogen-burning Arc. Konrad J. STAURT (*Proc. Roy. Soc.*, 1911, A, 85, 533—536).—The structure of the high-tension alternating arc in hydrogen, nitrogen, oxygen, and air has been examined. In the case of the pure gases, the luminosity is entirely due to the true current-carrying arc, but in air the arc is accompanied by an envelope of yellowish-green flame, which may rise to a considerable height above the arc, and terminates above in quite a sharp point like a candle flame. The luminosity of the arc proper is very small in comparison with that of the flame, but, since the flame gives no violet rays, the arc may be seen alone by examination through a deep violet glass. It then appears to be of about the same size and form as the arc in pure nitrogen. By reduction of the air pressure the distinction between the arc and the flame can be made more evident. Under these conditions, a rose-coloured arc is seen, which is separated from the surmounting yellowish-green flame by a slight dark interval. The phenomenon is further accentuated if the reduction in pressure is accompanied by an increase in the percentage of oxygen.

The behaviour of the arc flame indicates that the luminosity effect is identical with the after-glow sometimes observed in Geissler tubes filled with air. This has been shown to be due to the oxidation of nitric oxide by ozone (*Proc. Phys. Soc.*, 1910, 23). It has been observed since, that nitrogen peroxide gives the same result with ozone, and the author draws the conclusion that the yellowish-green

line of the arc is due to the interaction of ozone and oxides of nitrogen which are formed in the arc itself.
H. M. D.

Formation of Hydrogen Cyanide in the High Tension Electric Flame. I. MOSCICKI (*Zeitsch. Elektrochem.*, 1911, 17, 877).—Polemical. Lipinski obtained the information published (this vol., i, 849) while working in the author's employment in a confidential capacity.
T. E.

The Magnetic Properties of Some Nickel Steels. EDWARD LUTER GLAUBERT and SIEGFRIED HILPERT (*J. Iron Steel Inst.*, 1911, 83, 375—411).—Alloys of iron with 5.86, 24.32, and 32.90% of nickel have been examined after slow cooling from 1250°, and also after quenching from 600°, 900°, and 1240°, and after cooling to -30°, -100°, and -180°, a magnetometric method being used. The 5% steel is unchanged by quenching from 600° or by cooling, whilst quenching from 900° renders it martensitic, and greatly increases the coercive force. If quenched from 1240°, it is only partly martensitic, and is magnetically softer. The 25% steel is apparently non-magnetic in the stable condition, but becomes magnetic at low temperatures, no sharp critical point being observed. This alloy, quenched from 1240°, becomes as magnetic at -180° as that cooled slowly. It is suggested that a highly magnetic substance is formed at high temperatures, which dissociates between 600° and 900°, but may re-form on slow cooling. The structure of specimens quenched from 600° resembles that of natural meteoric irons, and when cooled to low temperatures becomes similar to that of quenched high-carbon steels. The 33% steel is little altered by quenching, and is not changed by cooling below zero. The structure is polyhedral, but etching with sulphurous acid develops a duplex structure, like that of the last alloy. It is improbable that γ -iron is non-magnetic.
C. H. D.

Influence of the Magnetic Field on Passive Nickel and Iron. HORACE G. BYERS and AGNES FAY MORGAN (*J. Amer. Chem. Soc.*, 1911, 33, 1757—1761).—It has been shown by Byers and Martin (Abstr., 1910, ii, 579) that when iron is used as an anode in various electrolytes, the current density required to produce the passive state is increased when the anode is placed in a magnetic field. It has now been found that the same is true in the case of nickel.

Magnetised steel is more difficult to render passive than the same steel which has not been magnetised, and soft steel is affected to a greater extent than hard steel. This is in accordance with the observations of Andrews (Abstr., 1893, ii, 16).

The positive pole of the magnets is rendered passive more easily than the negative pole.
E. G.

Magnetisability of the Salts of Metals of the Iron Group. ADOLF H. WEBER (*Ann. Physik*, 1911, [iv], 36, 624—646).—In continuation of previous experiments (Abstr., 1906, ii, 331), the author has measured the magnetic susceptibility of chromous and chromic chlorides and of cobaltous and cobaltic sulphates. The atomic

susceptibilities of the metals in these compounds are respectively: Cr in CrCl_3 , 0.01078, in CrCl_3 , 0.00625; Co in CoSO_4 , 0.01015, in $\text{Co}_2(\text{SO}_4)_3$, 0.00486. As in the case of manganese, the susceptibility of bivalent chromium and cobalt is greater than that of the trivalent metal, whereas the reverse is true for iron.

H. M. D.

Use of the Magnetic Field in Determining Constitution. XI. PAUL PASCAL (*Bull. Soc. Chim.*, 1911, [iv], 9, 866-872. Compare this vol., ii, 850).—An extension of the study of anomalous cases (*loc. cit.*) to colouring matters. The magnetic susceptibilities of the aminazo-compounds even after fusion and rapid cooling indicate that they possess the azo- and not the quinonoid structure. Similarly the magnetic susceptibility of magenta is in accordance with Rosenstiehl's formula.

The hydroxyazo-compounds exist in two forms having different densities: the one is yellow to orange-coloured and stable in the cold, the other reddish and stable on heating. Both co-exist in some cases. Consequently, the magnetic susceptibilities observed for the hydroxyazo-compounds vary with the treatment to which the substances have been subjected. In the fused state, or after fusion and rapid cooling, the magnetic susceptibilities are high, and are in accordance with a quinonoid constitution. After deposition from solution or after fusion and slow cooling, the magnetic susceptibilities are low, and indicate that the paler coloured forms have the azo-constitution.

The magnetic susceptibility of aurin indicates that it is quinonoid in structure.

The formulæ assigned by Torrey and Hunter (*Abstr.*, 1907, i, 1039) to the two forms of the silver derivative of tribromophenol are in harmony with their magnetic values.

T. A. H.

Magnetic Study of the Role of Water in the Constitution of Solid Hydrates. (Mlle.) E. FEYTS (*Compt. rend.*, 1911, 153, 668-671. Compare this vol., ii, 367).—The coefficient of magnetisation of salts in the anhydrous and in the hydrated condition has been measured to ascertain whether water of crystallisation has any effect on magnetic susceptibility. For the sulphates of cobalt, samarium, and gadolinium, the property is strictly additive, the observed values for the anhydrous substances agreeing with the numbers found by deducting the coefficient for water from that of the crystalline hydrated salt. In the case of copper sulphate, however, although the $4\text{H}_2\text{O}$ lost at 100° is without influence on the magnetic properties of the anhydrous compound, the remaining molecule, regarded as water of constitution, does not obey the law of additivity, since the coefficient for the anhydrous salt is identical with that of the monohydrate.

W. O. W.

Expansion Pressure of a Normal Liquid. L. GAY (*Compt. rend.*, 1911, 153, 722-724. Compare *Abstr.*, 1910, ii, 935, 1943. this vol., ii, 850).—The author develops the expression:

$$\log \pi = \log (RT/V - b) + b(V - b) - (EL - RT + PV)/RT,$$

wherein π is the expansion pressure of a liquid at constant temperature, T , of molecular volume, V and co-volume, b , L being the ideal molecular latent heat. Application to benzene shows that this furnishes a simple method for characterising normal liquids, or for determining the co-volume and internal pressure. Biron's determinations of the vapour density of benzene (Abstr., 1910, ii, 393) and Young's values for vapour pressure (Trans., 1889, 55, 486) were employed. The results were in close agreement with theory.

W. O. W.

Specific Heat and the Theory of Finite Increments of Energy. WALTHER NEERNST and F. A. LINDEMANN (*Zeitsch. Elektrochem.*, 1911, 17, 817—827. Compare this vol., ii, 465, 466).

The difference between the atomic heats calculated by Einstein's formula and those observed at low temperatures is discussed. The suggestion that all the atoms of a substance do not have the same frequency of vibration is dismissed, because all the atomic heat curves may be superposed by using a suitable temperature scale, and because Rubens and Hollnagel's measurements of the infra-red absorption bands of sodium and potassium chloride and potassium bromide show these to be quite narrow (Abstr., 1910, ii, 172). The author's new formula: $C_v = 3R/2\{(\beta v/T)^2 e^{\beta v/T}/(e^{\beta v/T} - 1)^2 + (\beta v/2T)^2 e^{\beta v/2T}/(e^{\beta v/2T} - 1)^2\}$, where $\beta = 4.865 \times 10^{-11}$ and v is the frequency of vibration of the atom, is shown to agree well with the observations down to 23° absolute when the values of v observed optically by Rubens and Hollnagel are used. The example of diamond is especially interesting, because both theory and observation indicate that its specific heat becomes practically zero at so high a temperature as 42° absolute.

The physical interpretation of the equation above given is discussed some length.

The possible application of the equation in the exact determination of atomic weights is also pointed out. As an example the atomic weight of silver is calculated from the specific heat-temperature curve to be 107.55.

T. E.

Mean Specific Heat of Crystallised and Fused Silicates 20—100°. KARL SCHULZ (*Centr. Min.*, 1911, 632—640).—The following determinations were made in a water calorimeter with the silicate heated at about 100°, and the water at about 20°. The raw materials were obtained by fusing the crystallised silicates in an electric oven.

	Crystallised.	Amorphous.
Lead metasilicate (PbSiO ₃)	0.07807	0.07886
Adularia from St. Gothard	0.1855	0.1895
Microcline with albite from Arendal	0.1665	0.1019
" " " " Miask	0.1845	0.1884
" " " " Setersdalen ...	0.1873	0.1909
Spodumene* from Branchville, Conn.	0.2161	0.2176

* M. p. about 1380°.

In every instance the specific heat is greater for the amorphous material than for the corresponding crystallised material. L. J. S.

Phosphoryl Chloride as a Cryoscopic Solvent. GROSSO and ANNA MANNESSIER (*Gazzetta*, 1911, 41, ii, 217-221. Compare Walden, *Abstr.*, 1910, ii, 1036).—Phosphoryl chloride, m. p. about -1° , containing some hydrate, has a cryoscopic constant 70.2 (compare Oddo, *Abstr.*, 1901, ii, 492). By fractional distillation over phosphoric oxide and repeated fractional crystallisation the melting point can be raised to 1.37° . The higher values given by Besson and by Thorpe must be erroneous, and the values -1.74° and $+1.782^{\circ}$, attributed to Oddo by various writers, including Walden (*loc. cit.*), were never obtained by him. Phosphoryl chloride of the highest melting point cannot be kept. For cryoscopic purposes, purification by dehydration, distillation, and a few crystallisations is sufficient; it then has m. p. $0.4-0.9^{\circ}$, and the cryoscopic constant of this product is 72.1. This constant was obtained from experiments with acetic anhydride, *n*-propyl ether, acetone, *n*-hexane, cyclohexanone, and sulphur chloride. Determinations with aromatic substances gave much more widely varying numbers, owing to substitution, and the mean was considerably higher. Hence the value 76.8, found by Walden, must be considered too high. The latent heat of fusion of phosphoryl chloride (calculated from $K = 72.1$, is 20.9 cal.

R. V. S.

Cryoscopy in Fused Sodium Thiosulphate. A. BOUTARD (*Compt. rend.*, 1911, 153, 876-877).—The freezing point of the salt $\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$ is 48.5° , and the temperature at which the solid pentahydrate and dihydrate are in equilibrium with the liquid is 48.2° . When the fused pentahydrate is employed as solvent for carbamide, sucrose or sodium chlorate, nitrate or sulphate, the molecular lowering of the freezing point is 44° . For potassium chlorate, nitrate, chloride and sulphate, and for ammonium nitrate, the lowering is practically double this number, corresponding with almost complete ionisation of these salts.

W. O. W.

Cryoscopic Behaviour of Quaternary Aromatic Ammonium Salts in Bromoform, and the Cryoscopic Measurement of a Velocity of Decomposition. EDGAR WEDEKIND and F. PAMMER (*Ber.*, 1911, 44, 3072-3080. Compare *Abstr.*, 1910, ii, 597).—From cryoscopic measurements it is found that quaternary ammonium salts of the type $\text{CH}_3\text{Ph} \cdot \text{NMePhRX}$ (where R = methyl, propyl, isobutyl or allyl, and X = Br or I) are considerably associated in bromoform solution, the association factor being approximately 2. The association cannot be attributed to the residual affinity of an unsaturated element, since it is found that phenylbenzylmethylallylammonium *d*-camphorsulphonate also exists in the form of double molecules.

The velocity of decomposition of phenylbenzylmethylallylammonium bromide in bromoform solution has been determined by measuring the gradual alteration in the depression of the freezing point. The initial constants thus obtained are in agreement with those determined by the polarimetric method.

Further evidence of the decomposition of quaternary ammonium

is furnished by the gradual diminution in the electrical conductivity of their solutions in chloroform; thus, after one hundred and fifty minutes at 25°, a 1.2% solution of phenylbenzylmethylallyl-ammonium iodide has a specific conductivity of only two-thirds of the initial value.

F. B.

Volatility of Sulphur Compounds. MARCEL DELÉPINE (*Compt. rend.*, 1911, 153, 725—727).—From collected data on the boiling point of numerous organic oxygen compounds and their sulphur analogues, it is shown that generally speaking substitution of sulphur for oxygen raises the boiling point, except in the case of water and the lower alcohols, phenols, and acids.

W. O. W.

Internal Pressure of Liquids and the Determination of the Absolute Zero. EMILE H. AMAGAT (*Compt. rend.*, 1911, 153, 851—857. Compare Abstr., 1909, ii, 549).—Leduc has recently stated (this vol., ii, 792) that the internal pressure of a gas diminishes with rise of temperature, but calculations from Chappuis' data leave this open to doubt, especially when it is borne in mind that the values are referred to a hydrogen thermometer instead of to one containing a perfect gas.

Leduc's conclusion is necessary to the maintenance of the theory that the internal pressure for gases of the same molecular complexity is proportional to the square of their molecular weights. When the value of the function $T \cdot dp/dT - p$ is calculated for hydrogen, it is necessary to pre-suppose the existence of a much greater variation of the internal pressure coefficient than can possibly exist, in order to bring the case into harmony with the theory. The values agree more closely with the present author's law of volumes when 273.0° is taken as the absolute zero than when the zero is taken as 273.1°. Conversely, assuming the truth of this law (that π and π' , the components of internal pressure, vary inversely as the square of the volume for molecular distances sufficiently great), calculation of the absolute zero gives 272.983° as the absolute zero for hydrogen, and 272.999° and 272.996° for nitrogen and oxygen respectively. It is shown that the critical density of diatomic and triatomic gases increases regularly with the critical pressures in such a way that the ratio p/d^2 varies within somewhat narrow limits.

W. O. W.

Boiling Point of Water. EARL OF BERKELEY and MALCOLM P. APPLEBEY (*Proc. Roy. Soc.*, 1911, A, 85, 477—489).—The boiling point of water, as determined by Buchanan's method (the so-called Landsberger-Sakurai method), has been compared with the hypsometer point. The small temperature differences involved were measured electrically by means of two platinum resistance thermometers. The sensitiveness of the measuring apparatus was such that the error attaching to the determination of the temperature difference was not more than 0.0001°.

The temperature at which water boils when a current of steam is passed through it depends on several factors, of which the chief are

the height of the liquid and the rate of passage of the vapor bubbles.

As compared with the hypsometric temperature, the boiling point rises with the height of the liquid if the steam is passed through at a constant rate. When the temperature differences are plotted against the height of the column of water, hyperbolic curves are obtained which cut the temperature axis at the origin at an approximate right angle. The curves can be represented by an equation of the form $t = kah^2/(h + \beta)$, in which t is the temperature difference, h the height of liquid, k , a , and β constants which depend on the form of the apparatus and the rate of bubbling.

For a given height of liquid, the boiling point falls with increase in the rate of passage of the steam. This apparently anomalous result is attributed to the influence of (1) the increased rate of bubbling on the agitation of the liquid, leading to increased loss of heat at the surface, and (2) the coalescence of the bubbles, leading to a diminished rate of heating.

H. M. D.

Boiling Points of Some Saturated Aqueous Solutions
EARL OF BERKELEY and MALCOLM P. APPLEBY (*Proc. Roy. Soc.*, 1911, A, 86, 489—505. Compare Abstr., 1904, ii, 648).—The electrical temperature-measuring apparatus employed in the experiments with water (preceding abstract) has been applied to the accurate determination of the boiling points of saturated salt solutions according to Buchanan's method.

Since the effect of changes in barometric pressure on the temperature equilibrium is greater for saturated solutions than for water, boiling-point measurements were made at different pressures, and a barometer-coefficient determined for each salt. This coefficient, which represents the excess of the effect of a pressure of one millimeter of mercury on the temperature of the boiling saturated solutions over that on the hypsometer temperature, is dependent on the solubility of the salt and on the temperature-coefficient of the solubility. For sodium sulphate its value is 0.00052° , whilst for potassium nitrate the coefficient is 0.0217° .

From the hyperbolic curves which express the relationship between the boiling point and the height of the column of boiling salt solutions, boiling points corresponding with a very thin layer of solution are calculated by suitable methods of extrapolation. These values are then corrected by means of the corresponding barometer-coefficients, and in this way boiling points obtained for normal pressure.

The boiling-point data are applied to the calculation of osmotic pressures by means of Porter's equation; the values so obtained show that all the salts are dissociated with the possible exception of thallous nitrate. Data representing the composition and density of saturated solutions of strontium nitrate are given in an appendix. H. M. D.

Partial Pressures of Water and Alcohols in Aqueous Alcohols. V. ANTONY G. DOROSCHESKY (*J. Russ. Phys. Chem. Soc.*, 1911, 43, 962—973. Compare Zawidzki, Abstr., 1901, ii, 6; Vrevsky, Abstr., 1910, ii, 1038).—By means of experimental data

obtained by Regnault, Konowaloff, and Vreysky, the author deduces the two following theorems:

(1) In any aqueous alcoholic solution, the ratio between the partial pressures of the water at any two temperatures is equal to the ratio between the vapour pressures of pure water at these temperatures, or the change of the partial pressure of water with temperature is identical in all mixtures of alcohol and water, independent of the composition of the solution or of the nature of the alcohol.

(2) The ratio between the partial pressures of an alcohol in its aqueous solution at any two temperatures is identical for all solutions, and is identical with the ratio of the vapour pressures of the pure alcohol at the same two temperatures.

It is shown that the differences between the compositions of the vapours evolved from one and the same aqueous alcohol solution at different temperatures are a direct consequence of these two theorems. If P and p denote the vapour pressures of the alcohol and water at the temperature t , and P_1 and p_1 the corresponding magnitudes at t' , then, if the ratio P/P_1 is greater than p/p_1 , the increase of the partial pressure with rise of temperature is greater for the alcohol than for water. The values of this ratio for water and for various alcohols in the case of various pairs of temperatures are given in the following table:

	20°/30°.	30°/40°.	40°/50°.	50°/60°.	70°/80°.	80°/90°.	90°/100°.
Water	0.540	0.574	0.597	0.618	0.638	0.657	0.691
Methyl alcohol....	0.592	0.613	0.634	0.656	—	—	—
Ethyl „	0.564	0.585	0.607	0.628	0.647	0.662	—
Propyl „	0.517	0.546	0.567	0.599	0.623	0.647	0.691

It follows that with rise of temperature the vapours from aqueous methyl and ethyl alcohols become richer in water, whilst with aqueous propyl alcohol the opposite is the case.

T. H. P.

Condensation of Vapours. FELIX BECKER (*Zeitsch. physikal. Chem.*, 1911, 78, 39—70).—The phenomena attending the condensation of vapours which are in equilibrium with the crystalline form as stable phase have been investigated. The condensation was effected in the usual way by sudden adiabatic expansion, and the formation of fog was detected by a very sensitive method depending on the reflection and refraction of light by the particles. The substances chiefly used were nitrophenol, menthol, camphene, camphor, borneol, isoborneol, benzophenone, and iodine.

Substances which in the liquid form can be considerably supercooled condense at first as liquid drops, but substances which cannot easily be supercooled in the liquid form pass directly from vapour to crystalline form. The amount of reduction of pressure which is just sufficient to produce condensation on adiabatic expansion, and its dependence on the temperature, have been investigated, and it is shown that the condensation of a vapour to liquid drops occurs the more readily the denser the vapour, whereas the formation of crystals is retarded by increasing density of vapour. From the minimum depressions just sufficient to produce condensation, the supercooling which the vapours have undergone is determined, and hence a curve is constructed

showing the limits within which the vapour can be realised on crossing the sublimation curve.

Iodine is exceptional, inasmuch as on considerable reduction of pressure it condenses as visible particles, but with smaller depressions (as shown by thermal observations) it condenses as invisible particles. None of the other substances investigated shows an intermediate stage in condensation.

The supercooling before condensation occurs is the same whether the vapour is or is not in contact with a smooth glass wall, and hence the latter has no influence on the condensation.

Water vapour condenses as liquid drops for temperatures down to -4° and reductions of pressures up to 400 mm., so that the limit ice-liquid lies at still greater reductions of pressure. (G. S.)

Pressure-Temperature Sections. J. P. WUIJK (*Zeitsch. physikal. Chem.*, 1911, 78, 71—85).—A space figure is constructed for a two-component system for the case in which the components form a solid compound which as regards volatility lies between the two components, the assumptions being that the components are completely miscible in the liquid state and not miscible in the solid state, and that the volatility of the liquid mixtures diminishes continuously according to the proportion of one of the components. By means of this figure and the simple space figure of Roozeboom, the pressure-temperature sections for varying conditions are completely investigated. (G. S.)

New Methods of Resolving Mixtures of Liquids with Adjacent Boiling Points or Constant-boiling Mixtures. A. GOLOPZ (*J. Russ. Phys. Chem. Soc.*, 1911, 43, 1041—1061).—The method used by the author consists in adding to the mixture of two liquids a suitable proportion of a third component which forms with one of the original constituents a constant-boiling mixture with a boiling point lower than those of all the other elements of the mixture, that is, of the liquids themselves, and of any other possible combinations; the ternary mixture thus obtained is then rectified. The method can be applied either when the boiling points of the two liquids are very close, or when they form a mixture with a constant boiling point.

Several examples are given, one which is of technical importance being as follows: If 195 grams of 65.5% aqueous acetic acid are mixed with 272 grams of toluene, and the mixture distilled through a Hempel column, the first fraction of 337 grams, b. p. $84-85.5^{\circ}$, will contain practically all the toluene and water and only 4.1% of the acid; the last fractions, amounting to 107 grams, contain 96.6% of acetic acid, and the final one of these, 64 grams, 99.9% of acid. (T. H. P.)

A Simplified Combustion Calorimeter. ROBERT WHIGHAM (*Chem. News*, 1911, 104, 201—202).—The calorimeter consists of a glass bell-jar carrying on its flange a lead weight heavy enough to seal the jar when filled with oxygen. The fuel is contained in a nickel crucible supported on a small tripod, which is part of the brass base

plate. This base plate is cut from heavy sheet brass, and provided with broad tongues at the edge to clamp it to the base of the jar; hinges are also cut in it which turn up and form the tripod.

The oxygen for combustion is led through a tube of Jena glass, which slides through a cork in the neck of the jar, and is enlarged at the lower end. The outside of the jar is fitted with a ring of brass wire gauze projecting at right angles to the sides.

The combustion is carried out in the usual way with calorimeters of this type, the factor of the instrument being found by burning a substance of known calorific value.

T. S. P.

Thermochemical Investigations. IV. Heats of Combustion of Terpenes and Styrenes and Prediction of Heats of Combustion. KARL AUWERS, WALTER A. ROTH, and FRITZ EISENLOHR (*Annalen*, 1911, 385, 102—116. Compare Abstr., 1910, ii, 586).—It has been found that the heats of combustion of the terpenes and the styrenes already published (*loc. cit.*) are about 0.5% too low, in consequence of the difficulty of ensuring the complete combustion of lightly volatile liquids in the bomb calorimeter. A new series of estimations, performed in a modified apparatus, is being carried out. The results, which show that the theoretical deductions stated previously are still correct, were being held back until the series was completed. However, the appearance of Lemoult's paper (this vol., i, 583) forces an immediate answer from the authors. Lemoult's heats of combustion of styrene, α -methylstyrene, and $\alpha\beta$ -dimethylstyrene differ from those obtained by the authors by a constant amount, about 1.2%. This suggests that the discrepancy is due to a constant error (probably in the value of the water-equivalent of the calorimeter). The confidence with which Lemoult relies on his experimental values on account of their agreement with "calculated" values may be misplaced, because, although in some cases the observed and the calculated values are concordant, in others the difference is more than 1%, that is, more than ten times the experimental error.

C. S.

Vapour Pressure and Integral Heat of Solution for Saturated solutions. ALEXANDER SPERANSKI (*Zeitsch. physikal. Chem.*, 1911, B, 86—109. Compare Abstr., 1909, ii, 378).—The differences in the vapour pressures of pure solvent and saturated solution have been determined by the tensimeter for saturated solutions of oxalic acid, succinic acid, and a number of inorganic salts in water, and for saturated solutions of acetanilide in chloroform, and *m*-dinitrobenzoic benzoic acid in chloroform, and from the results, the vapour pressures of the saturated solutions between 20° and 60° have been calculated. Except in the case of sodium thiosulphate, the vapour pressures increase as the temperature rises. In accordance with the principles of thermodynamics, the ratio p_1/p_2 , where p_1 is the vapour pressure of the solution and p_2 that of the solvent, diminishes with rise of temperature, except for the solution of sodium carbonate monohydrate.

For all the solutions, the relationship between vapour pressure and temperature is satisfactorily represented by Bertrand's formula:

$p = k[(T - \lambda)/T]^n$, where k and λ are constants. From the analogy between vaporisation and dissolution, it might be anticipated that Bertrand's formula in the form $C = G[(T - \lambda)/T]^n$, where C is the solubility, would represent the variation of the solubility with temperature, and this is shown to be the case. The formula $\log p = a \log C + b$, where C is the solubility in grams per 100 grams of solution, and a and b are constants, is valid for most of the solutions investigated.

It is further shown that the formula $\log p_2/p_1 = a + b/T$ is valid for certain solutions, a and b being constants. Combining this with the formula $[d \log p_2/p_1]/dT = l/RT^2$ (Kirchhoff's formula), where l is the integral heat of solution, it follows that l must be nearly constant, and hence that the van't Hoff formula $\log (p_1/p_2) = -l/2T$ can be used to calculate the integral heat of solution for saturated solutions at temperatures exceeding $30-40^\circ$.

G. S.

Dependence of the Integral Heat of Solution on the Temperature. A. WOITASCHESKY (*Zeitsch. physikal. Chem.*, 1911, 78, 110—122. Compare Speranski, preceding abstract).—It is shown that all the formulas representing the variation of the vapour pressure of a pure liquid with the temperature also apply to the variation of the vapour pressure of a saturated solution with temperature. On this basis, the conclusion is drawn that the integral heat of solution diminishes with the temperature when it is positive, and increases with temperature when it is negative; in other words, the absolute magnitude of the integral heat of solution always diminishes with the temperature. Kirchhoff's formula (compare Speranski, previous abstract) is not directly applicable to the experimental data.

G. S.

The Theory of Solution and Heats of Dissolution. ALBERT COLSON (*Compt. rend.*, 1911, 153, 812—814).—The author points out that the heat of dissolution of a gas should be equal to the sum of its latent heat of vaporisation and the heat of polymerisation of the dissolved molecule. This is known to be true in cases such as that of acetic acid, in which the degree of polymerisation is the same for the dissolved substance as when it is in the gaseous condition. The term *dissomolecule* is employed to denote a polymerised molecule in solution.

W. O. W.

A General Relation between the Physical Properties of Substances; Application to Densities. G. TER-GAZARIAN (*Compt. rend.*, 1911, 153, 871—874. Compare Abstr., 1908, ii, 666; 1909, ii, 551).—It has been shown previously that for members of a homologous series, the densities corresponding with temperatures distant the same number of degrees from the critical temperature differ only by a factor which increases with the molecular weight and varies according to the series. It has now been found that this holds good, not only for densities, but also for coefficients of viscosity, heights of capillary ascension, rectilinear diameters, and the latent heat of vaporisation calculated by Mills' method. The best published data were employed for the verification of this generalisation.

W. O. W.

Weight of a Falling Drop and the Laws of Tate. X
Drop Weights of Some Further Associated and Non-associated Liquids, and the Surface Tensions and Capillary Constants Calculated from Them. J. LIVINGSTON R. MORGAN and F. T. OWEN (*J. Amer. Chem. Soc.*, 1911, 33, 1713—1727, Compare Abstr., 1908, ii, 356, 668; this vol., ii, 372, 584, 585, 698, 699, 857).—On applying the equation $w(M/d)^{2/3} = k_d(t_c - t_0 - 6)$ to the drop weights in order to find a value of t_0 independently of the temperature of observation and using in all cases the value of k_d found for benzene ($t_c = 288.5^\circ$), it has been found that methyl hexyl ketone, phenylacetonitrile, benzaldehyde, piperidine, diisooamyl, isooamyl acetate, and nitrobenzene have a normal molecular weight, whilst methyl ethyl ketone, diethyl ketone, propionitrile, and acetone are abnormal and therefore associated.

The values of the surface tensions of these liquids in dynes, γ , and of the capillary constant, a^2 , calculated respectively from the drop weights and drop volumes, agree well with the values obtained from the capillary rise.

Equations are given expressing the variation of the surface tension and the capillary constant, as found from the drop weight, for all the liquids mentioned.

E. G.

The Viscosity of Suspensions and the Determination of Avogadro's Number. M. BANDELIN (*Zeitsch. Chem. Ind. Kolloide*, 1911, 9, 154—156).—Measurements have been made of the viscosity of aqueous suspensions of gamboge and gum mastic. The experimental data are in accord with Einstein's formula, according to which the ratio between the viscosity of the suspension and the suspending medium is independent of the size of the suspended particles, but varies in a linear manner with the mass of the particles contained in unit volume of the suspension.

Experiments with various aqueous solutions indicate that the relationship between the viscosity of the solution and of the solvent can be represented in certain cases by a formula of the same type. This is true for solutions of glycerol, sucrose, and sulphuric acid, but not for solutions of phenol or carbamide.

The validity of Einstein's viscosity formula for suspensions of molecular dimensions permits of the deduction of the number of molecules in unit volume. From the data for sucrose solutions this is found to be 70×10^{22} , which agrees satisfactorily with Perrin's value deduced from observations on the Brownian movement.

H. M. D.

Molecular Complexity in the Liquid State. PHILIPPE A. GUYE (*J. Chim. phys.*, 1911, 9, 505—518. Compare Turner and Merry, *Trans.*, 1910, 97, 2069).—Association in the liquid state was held by Turner and Merry to be due to electrical rather than chemical forces. The author is unable to find any essential difference between the two points of view, since chemical forces are almost certainly electrical in origin. Moreover, polymerisation in the liquid state is related to polymerisation in the vapour by the mass action law (Abstr.,

* 1910, ii, 841). Surface tension, boiling point, vapour tension, and latent heat measurements do not indicate the molecular complexity of liquids apart from the surface film, and where easily oxidisable substances, such as phenylurethane and diphenylamine, are measured in contact with air the result may be wholly misleading. All the liquids giving higher values of Ramsay and Shields' coefficient than $k=2.2$ are substances of high molecular weight and high boiling point, and in these cases the high surface pressure may considerably influence the molecular condition in the surface film. The only trustworthy methods are those such as Traube's volume method, which is independent of the surface film.

The recent observations of Walden on tristearin, tripalmitin, and isobutyl ricinolate are to be interpreted as showing marked dissociation of these substances in the surface film. The author suggests that the dissociation products are alkylene and acid.

R. J. C.

Stability of Oil-Water Emulsions. EMIL HATSHUK (*Zeitsch. Chem. Ind. Kolloide*, 1911, 9, 159—164).—The author discusses the conditions which determine the stability of emulsions and the rate at which clearing takes place under the influence of electrolytes. It is calculated that an emulsion of an oil of density 0.7, which contains 0.1% of the disperse phase and consists of particles of diameter 0.4μ , is subjected to an upward force amounting to 1.10^{-11} dyne per particle, whereas according to Lewis's data for the magnitude of the electric charge, the electrical force of repulsion between two neighbouring particles amounts to 2.3×10^{-8} dyne. The very much greater magnitude of the electric force is in harmony with the exceptional stability of such highly disperse emulsions.

In accordance with Stokes's formula, the rate of clearing of particles of a given size on the addition of an electrolyte must depend to a large extent on the difference between the densities of the disperse phase and the dispersive medium. In this connexion, observations are recorded relating to the condition of oil-water emulsions at intervals of twenty-four, forty-eight, and one hundred and twenty hours after the addition of an electrolyte. The clearing process involves three stages

(1) the electric discharge of the particles; (2) the formation of larger complexes; (3) the mechanical separation of these from the disperse medium, and of these, the second and the third represent changes which in general require considerable time for their completion.

H. M. D.

The Nature of Solvatee and the Relationships between Adsorption and Dissociation. WOLFGANG OSTWALD (*Zeitsch. Chem. Ind. Kolloide*, 1911, 9, 189—195).—The view is put forward that solvates may be regarded as absorption compounds between solute and solvent. For the special case of aqueous solutions of salts, reference is made to the connexion between the ionisation of a given salt and its degree of hydration, and it is pointed out that Noyes's formula $C(1-\gamma) = K(C\gamma)^n$ connecting the degree of ionisation (γ) with the concentration (C) can be written in the form $C\gamma = K_3(C - C\gamma)^n$, which is of the same type as the adsorption formula $x = K(C - x)^n$.

Not only is the form of the equations identical, but more or less quantitative relationships are also shown to exist between the two groups of phenomena. The exponents in the two equations are of the same order of magnitude, and their variation is confined to rather narrow limits. Both ionisation and adsorption exhibit maxima, have small negative temperature-coefficients, and show similar deviations from the exponential formula at high concentrations. These facts are in favour of the hypothesis that the hydration of salts in aqueous solution may be looked on as an adsorption of the solvent by the solute.

H. M. D.

Adsorption of Neutral Salts. HILARY LACHS and LEONOR MICHAELIS (*Zeitsch. Elektrochem.*, 1911, 17, 917—919).—The statement in the previous paper (this vol., ii, 190) that the anion and cation are adsorbed in equivalent amount by blood charcoal from a neutral aqueous solution of potassium chloride is erroneous. As a matter of fact Cl^- ions only, and no K^+ ions, are adsorbed. It would therefore be anticipated that the solution, after adsorption of Cl^- ions, must contain free potassium hydroxide, but it has not been possible to obtain a quantitative proof of the presence of alkali. It is probable that the potassium is present as carbonate or other salt the negative component of which originates from impurities in the charcoal.

From an acidified solution of potassium chloride no K^+ ions are adsorbed, but in the presence of bases, such as ammonia and piperidine, K^+ is adsorbed. The adsorption of K^+ is most favoured when the solution is about $N/50$ with reference to ammonia. On the other hand, pyridine has no influence on the adsorption of K^+ , so that the effect of bases depends partly on the nature of the cation. As it has previously been shown that Cl^- ions are not adsorbed from an alkaline solution of potassium chloride, the potassium must be taken up as the hydroxide.

The authors consider that these observations support their view that adsorption in such cases is a purely electrical phenomenon.

G. S.

Adsorption Compounds (Van Beemelen). UGO PRATOLONGO (*Gazzetta*, 1911, 41, ii, 382—412).—The author has carried out three series of experiments with the products which are precipitated when a solution of sodium aluminate is added to a solution of sodium silicate. The first series had for its object the determination of the variation in the composition of the precipitates formed, according to the relative concentrations of the solutions. The second set deals with the variation in the solubility of one of the compounds (of sodium aluminate and sodium silicate), according to the amount of the solid substance present. In the third series of experiments, determinations are made of the variations in the amount of ammonium chloride or potassium chloride adsorbed by the product used in the second series, according to the relative amounts of liquid and solid phases present. In these experiments the adsorption is measured by means of the equilibria

reached (a) when the concentrations of the salt solutions is increasing, and (b) when the concentrations of the salt solutions is decreasing. The results indicate that a solid phase of the type employed can give rise to a trivariant system, in which the solid phase behaves as though it had a variable concentration.

The system also presents the phenomenon of chemical hysteresis (evidenced in the third set of experiments), that is to say, permanent modifications may be formed.

R. V. S.

Adsorption in Solution. I. Retention of Acids by Sheep's Wool. GEORG VON GEORGIEVICS and ARTUR POLLAK (*Monatsh.*, 1911, 32, 655—675).—The wool used was very carefully purified by treatment in turn with boiling distilled water, hot soap solution, boiling 2% hydrochloric acid (on the weight of wool), lukewarm very dilute ammonium carbonate, warm water containing very little acetic acid, and boiling distilled water.

The retention of acids by wool is an adsorption phenomenon which within certain limits takes place according to definite law. In general, mineral acids are more strongly adsorbed than fatty acids. The concentration of the acid has considerable influence on the adsorption; an acid may be adsorbed more strongly than another acid from dilute solution and less strongly in more concentrated solution. There is no proportionality between the strength of an acid and its adsorption by wool; this is contrary to the conclusions of Walker and Appleard with silk (*Trans.*, 1896, 69, 1334). There is absolutely no connection between the adsorption and the amount of dissociation of an acid.

Less acid is adsorbed by wool from a mixture of acids than the arithmetical mean of the adsorption from two acids used singly. This negatives the possibility of simple salt formation between the acid and the thread substance.

E. F. A.

Substantive Dyeing. W. G. SAPOSCHNIKOFF (*Zeitsch. physikal. Chem.*, 1911, 78, 209—227).—Both the dyes and the materials were carefully purified, and, in contrast to the technical method, no salts were added. The dyeing was effected by boiling the material with a solution of the dye for two hours, a reflux condenser being used. The material was then washed, and the amount of dye taken up determined by fusing it with sodium hydroxide and nitrate, and estimating the sulphur as sulphate, the amount of sulphur in each dye being determined in like manner. The results of five series of experiments, in each of which the conditions were widely varied, are quoted.

It is shown that the results are represented satisfactorily by the adsorption formula: $\log C_f = \log \beta + 1/a \cdot \log C_b$, where C_f and C_b are the final concentrations of dye in the material and in the bath respectively, and a and β are constants, or by the related formula: $C_f^2 + AC_f - A \cdot 10k = 0$, where A is a constant and $10k$ represents the dyeing limit, the greatest concentration of dye which the material can remove from the bath. A comparison of two experiments, for which all the characteristics are different, leads to the formula: $C_b/C'_b = [(10k - C_f)K_w]/[(10k - C'_f)K_w]$, that is, the end concentrations

of the baths are directly proportional to the differences between the dyeing limit and the effective dyeing, and inversely proportional to the bath moduli, which are functions of the original dye concentration in the bath.

The above laws are followed whether the materials retain their natural structure (cotton wool) or have undergone treatment (mercerised cotton). Under equivalent conditions mercerised cotton becomes dyed about 10% more deeply than the natural wool.

G. S.

Dissociation Constant K_2 of Sulphuric Acid and Oxalic Acid. JOHANNES E. ENKLAAR (*Chem. Weekblad*, 1911, 8, 824—829).—By means of the hydrogen electrode and a dilute solution of sodium hydrogen sulphate, the author has determined the mean value of the second dissociation constant of sulphuric acid at 18° to be $K_2 = 0.018$. For oxalic acid the value K_2 was calculated from the dissociation curve of oxalic acid, and the concentration of the hydrogen ions (1.3×10^{-3}) in a solution containing 0.05 gram of sodium hydrogen oxalate per litre, and was found to be $K_2 = 4.7 \times 10^{-3}$. Another calculation based on the electric conductivity yielded the value $K_2 = 1.3 \times 10^{-3}$. Both the values obtained for oxalic acid are therefore of the same order as the dissociation constant of acetic acid, $K = 1.8 \times 10^{-5}$.

A. J. W.

Osmotic Pressure. MAURICE PRUD'HOMME (*Bull. Soc. chim.*, 1911, [iv], 9, 857—862).—A mathematical investigation of osmotic pressure on the basis of an analogy between gravitational attraction and osmotic pressure. The details are unsuitable for abstraction. It is shown (1) that osmotic pressure is not directly proportional to the mass of the dissolved substance, which is in harmony with Fouard's experimental results; (2) that from the general equation arrived at in this investigation the known formulæ expressing the behaviour of dilute solutions under various conditions are deducible.

T. A. H.

The Theory of Solutions. ALBERT COLSON (*Compt. rend.*, 1911, 153, 719—721).—The author considers that the experimental data on osmotic pressure are not sufficiently in agreement with theory to support the hypothesis as to the analogy between osmotic and gaseous pressure, that is, to warrant the identification of K and p in the expression $PV = RT$, and $\omega V = pT$ when ω is the osmotic pressure.

W. O. W.

Osmotic Measurements of Salt Solutions and Arrhenius' Theory of Ions. EUGÈNE FOUARD (*Compt. rend.*, 1911, 153, 169—772. Compare this vol., ii, 267).—A theoretical discussion based on measurements of osmotic pressure made by the apparatus already described. The author draws attention to the divergences between his results and those required by the ionic theory.

W. O. W.

Direct Measurements of the Osmotic Pressure of Casein in Alkaline Solution. Experimental Proof that Apparent Impermeability of a Membrane to Ions is Not due to the Properties of the Membrane but to the Colloid contained within the Membrane. BENJAMIN MOORE, HERBERT E. ROAF, and ARTHUR WEBSTER (*Biochem. J.*, 1911, 6, 110—121. Compare Moore and Roaf, *Abstr.*, 1908, ii, 204).—The osmometer used in the experiments has been described in previous papers. At the commencement of an experiment, the osmometer chamber contained a certain concentration of caseinogen and of sodium hydroxide, and the outer liquid was a solution of sodium hydroxide of the same concentration as that inside the cell. The observed osmotic pressure was very low at first, but the exterior sodium hydroxide slowly diffused inwards through the membrane, and simultaneously the osmotic pressure increased. The inward passage of sodium hydroxide is against the gradient of osmotic pressure. The alkali in the osmometer unites in some form with the colloid, and it is this union which causes the osmotic pressure. The purpose of the membrane is the purely mechanical one of holding together the colloidal aggregates, and its apparent impermeability to the ions is quite fictitious. Free ions pass through quite readily, but ions associated with colloid are retained on the colloid side and produce pressure. The high concentration of crystalloid within and the low concentration without is due to a specific affinity between crystalloid and colloid. The maximum of osmotic pressure per 1% of colloid is reached at about 0.047*N* of free alkali, and further increase of alkali lowers osmotic pressure. In the course of the experiments pressures as high as 686 mm. were observed. These considerations are applied to the elucidation of the osmotic behaviour of living cells, which is discussed in detail. (G. S.)

Permeability of Porcelain and Copper Ferrocyanide Membranes. F. E. BARTELL (*J. Physical Chem.*, 1911, 15, 659—674. Compare Bigelow and Bartell, *Abstr.*, 1909, ii, 979).—The rate at which water passes through unglazed porcelain and through an electrolytic copper ferrocyanide membrane under the influence of pressures up to 5885.7 mm. and 2957.9 mm. respectively was found to obey Poiseuille's laws relating to capillary tubes.

The porcelain membranes gradually became less permeable during the experiments, apparently owing to fine particles being torn off and forced into the capillary passages. On this account each series of determinations was immediately repeated in reverse order, and the average of each pair of values at the same pressure was taken as the rate for the membrane half way through the experiment. The permeability of the copper ferrocyanide membrane deposited in porcelain was only about 4% of the permeability of the 4.5 mm. porcelain plate, and no clogging of the membrane occurred.

The rate of permeation varied directly as the pressure at a constant temperature, and inversely as the viscosity of water when the temperature was altered and the pressure kept constant.

The fact that the same laws govern the passage of water through capillary tubes as through porcelain and ferrocyanide membranes is not

generally in favour of the theory that these membranes are capillary structure, since the passage of liquids through molecular interstices may be found to be amenable to the same mathematical treatment.

R. J. C.

The Influence of Affinity in Solutions. MICHAEL RÓZSA (*Electrochem.*, 1911, 17, 934—938).—When to a mixed solvent the components *A* and *B* a third substance, *C*, readily soluble in *A* but only slightly soluble in *B*, is added, the freezing point of the mixed solvent is very often raised. For example, the addition of water to the mixed solvent benzene-alcohol raises the freezing point of the latter to an extent depending on the proportion of water added. The explanation given is that *C* forms chemical compounds with *A* or *B*, the number of molecules of solute being thus diminished. In this way the existence of molecular compounds of alcohol-water, phenol-water, alcohol-glycerol, alcohol-lactic acid, phenyl-glycerol, phenol-lactic acid, water-sulphuric acid, and water-stannous chloride has been proved. The quantitative composition of these compounds has not been determined.

The results appear to show the existence of considerable affinity between solvent and solute in dilute solution, and also that the influence of the solute extends over the whole of the solvent.

G. S.

Solubility of Sparingly Soluble Salts. MAURICE PRUD'HOMME (*Chim. phys.*, 1911, 9, 517—537. Compare Kohlrausch, *Abstr.*, 1908, ii, 814).—The molecular conductivity, Λ , of a solution is approximately related to the dilution by the expression $\Lambda = cv^{1/n}$, where *c* and *n* are constants. The minimum value, *V*, of the dilution for which ionisation is complete can be calculated, the ultimate molecular conductivity being represented by Λ_r instead of the more usual Λ_{∞} .

It follows that $\Lambda_r - \Lambda_s = (V/v)^{1/n}$, where *v* is the dilution of a saturated solution. The author shows that with twenty-one common valent salts *n* has a value very near 3.06. Taking $(\Lambda_r - \Lambda_s)/\Lambda_r = r$ and $1/\Lambda_r = k$, the above equation may be written $rv^{1.306} = RV^{1.306} = k$. The value of *k* deduced from Berkeley's accurate data for thallium chloride is 0.40154. From these equations it is possible to deduce the solubility of a salt, knowing the conductivity of its saturated solution and the value of Λ_r obtained from Kohlrausch's tabulated values of the ionic conductivities.

The solubilities of a number of sparingly soluble sulphates, carbonates, oxalates, etc., deduced in this way agree very well with solubilities calculated by Kohlrausch in the majority of cases, when the salts are hydrated, the author's method gives too high a value for Λ_r , and hence too low a value for the solubility.

With the very sparingly soluble salts cuprous thiocyanate, mercuric chloride, lead chromate, silver bromide, and silver iodide, the dilution in saturated solution is higher than that required to give complete ionisation, that is, $v > V$. The author's solubility values are then to be referred to those of Kohlrausch. In all cases where $V > v$ the

empirical formula $v = 0.904 \times (\Lambda_{\infty} - 1/10^3 \chi)^{1/2}$ may be used to calculate the solubility. This equation is independent of the reception expressed by V , and requires only the determination of the conductivity of the saturated solution.

Effect of Salts on the Solubility of Other Salts. ARTHUR A. NOYES and WILLIAM C. BRAY (*J. Amer. Chem. Soc.*, 1911, 33, 1643—1649).—The well-known solubility principles, based on the law of mass-action, that (1) the product of the concentration of the ions of a salt, present as solid phase, has the same value in dilute solutions of other salts as it has when present alone, and that (2) the concentration of the non-ionised portion of a salt, present as solid phase, has the same value in dilute solutions of other salts as it has when present alone, are not accurate, but are subject to deviations. Those of the first lying in the opposite direction to those of the second. The work described in this and the following papers has been undertaken with the object of studying the character and magnitude of these deviations, and, for this purpose, the concentration of the non-ionised portion and the product of the concentrations of the ions of the salt with which a solution is saturated have been calculated.

It is shown by reference to curves in which the solubilities of thallous chloride, thallous oxalate, silver sulphate, and calcium hydroxide are plotted against the concentration of added salts, namely, lead nitrate, potassium oxalate, potassium sulphate, and sodium hydroxide, respectively, that, in the case of uni-bivalent salts, the solubility product principle is not even approximately true when a salt with a common bivalent ion is added. The ion-concentration product increases greatly, since the large addition of the bivalent ion is not compensated by any great decrease of the univalent ion of the salt with which the solution is saturated.

Effect of Salts on the Solubility of Other Salts. II. ARTHUR A. NOYES, C. R. BOGGS, F. S. FARRELL, and M. A. STEWART (*J. Amer. Chem. Soc.*, 1911, 33, 1650—1663. Compare preceding abstract).—Determinations have been made of the solubility of potassium perchlorate in presence of potassium chloride and potassium sulphate at 25°, thallous chlorate and sulphate in presence of each other at 20°, and thallous sulphate in presence of thallous nitrate, sodium sulphate, and sulphuric acid at 25°. Conductivity measurements were made in order to obtain the various ionisation values.

The results show that the solubility of potassium perchlorate is reduced by the presence of potassium chloride or sulphate. The chloride has less influence on the solubility than the sulphate, which corresponds with its lower degree of ionisation.

The solubilities of thallous chlorate and sulphate are reduced when both salts are present as solid phases.

The solubility of thallous sulphate is greatly diminished in presence of thallous nitrate, a salt with a common univalent ion, and the decrease agrees qualitatively with the principle of the constancy of the ionic solubility product. Sodium sulphate, on the other hand, does not effect the expected reduction, the solubility being lessened by

in a 0.1*N*-solution of this salt, and is actually increased by 1.4% solution. The solubility is also increased by sodium hydrogen sulphate and by sulphuric acid. E. G.

Effect of Salts on the Solubility of Other Salts. III. Solubility of Thallous Chloride in Solutions of Potassium Nitrate, Potassium Sulphate, and Thallous Sulphate at 25°. (WILLIAM C. BRAY and W. J. WIXXINGHOFF (*J. Amer. Chem. Soc.*, 1911, 33, 1663-1672. Compare preceding abstracts).—Experiments were made to ascertain the effect of thallous sulphate and of potassium nitrate and sulphate on the solubility of thallous chloride. These are supplementary to the work of Noyes (Abstr., 1892, 1143) on the solubility of thallous chloride in presence of thallous nitrate, thallous chlorate, and several chlorides. The solubility and conductivity measurements were made at 25°.

The solubility of thallous chloride is increased by the presence of potassium nitrate or sulphate, salts without a common ion, as would be expected on account of the formation of thallous nitrate and sulphate by metathesis. The solubility is greatly decreased by thallous sulphate, a salt with a common ion, and this decrease is in qualitative agreement with the principle of the constancy of the solubility product. The solubility curves for salts with a common ion seem to lie more closely together than would be expected on the widely different ionisation values. E. G.

Effect of Salts on the Solubility of Other Salts. IV. Quantitative Discussion of the Solubility of Univalent Salts in the Presence of Other Salts. WILLIAM C. BRAY (*J. Amer. Chem. Soc.*, 1911, 33, 1673-1686. Compare preceding abstracts).—The results of the work recorded in the two preceding papers are discussed quantitatively by a method which consists essentially in calculating, by the aid of the ionisation values, the concentration of the non-ionised portion and the product of the concentrations of the ions of the salt with which the solution is saturated, both when present alone and when another salt is present.

According to the mass law, the concentration (B_1) of the non-ionised form and the solubility product (B^+A^-) should be constant in a saturated solution. It is shown, however, that in every case the one decreases considerably and the latter increases slightly as the total concentrations of the salts and of the ions in the saturated solution increase.

These variations can be expressed approximately as a function of the total ion concentration (Σi) in the solution by the exponential relations $(BA) = k_0(\Sigma i)^{m_0}$ and $(B^+)(A^-) = k_1(\Sigma i)^{m_1}$, in which k_0 , k_1 , and m_0 are constants which were separately determined for each salt in the presence of each added salt. In the case of thallous chloride, in which the range of concentration of the added salts was very large, the equations do not fully express the results, but different values of m_0 or m_1 must be assumed at different concentrations. The laws found for these exponents are recorded. Those for m_1 at the

concentration $0.016N$ are small and less than those at higher concentrations, and this indicates that the solubility product is practically constant in the case of less soluble salts in the presence of small quantities of other salts.

The values of m_i are much smaller than those of m , at concentrations, and hence the deviation from the theoretical relation $(H^+)(A^-)(BA)=k$ is due more to abnormal behaviour of the ionised substance than to abnormal behaviour of the ions.

These results indicate that the ratio of the activity of the ionised portion to the concentration of univalent ions is nearly constant below $0.016N$, but that at higher concentrations it decreases with increasing concentration, at first slowly and then more rapidly. The corresponding ratio for the non-ionised portion increases with increasing concentration throughout the whole range of concentrations investigated.

The nearly uniform effect exerted on the concentration of the ionised portion and on the solubility product by the salts of different valence types, and by those with and without a common ion, confirms the assumption that the ionisation relations of univalent salts are primarily determined by the total equivalent ion-concentration. There are, however, consistent differences of secondary order in the effects of the different kinds of salts, and especially between uni-univalent and uni-bivalent types.

Laws of "Concentrated" Solutions. III. Ionization and Hydration Relations of Electrolytes in Aqueous Solution at 0° : (A.) Cesium Nitrate, Potassium Chloride, and Lithium Chloride. EDWARD W. WASHBURN and DUNCAN A. MILES (*J. Amer. Chem. Soc.*, 1911, 33, 1686—1713. Compare *ibid.*, 1908, ii, 862).—Determinations have been made of the depression of f. p., densities, relative viscosities, and equivalent conductivities of solutions of cesium nitrate, potassium chloride, and lithium chloride at 0° , and of concentrations up to N in the case of potassium and lithium chlorides, and to $0.5N$ in that of cesium nitrate. These salts were selected, since cesium nitrate is only slightly hydrated, all hydrated, whilst lithium chloride combines with large quantities of the solvent, and potassium chloride occupies an intermediate position.

The cryohydric point for cesium nitrate is -1.254° .

When the f. p. curves for the three salts are compared with that of the normal solute, that is, one which is neither associated, dissociated, nor hydrated, potassium chloride is found to agree exactly up to about $0.5N$, lithium chloride deviates decidedly in the direction of hydration, whilst cesium nitrate deviates markedly in the opposite direction. The conclusion is drawn that deviation from the behaviour of a normal solute cannot serve as the basis for the calculation of the degree of hydration of an electrolyte. Another method for making this calculation is indicated, which has shown that about 24 molecules of water are combined with 1 mol. of potassium chloride, and about 18 moles with one of lithium chloride in $0.5N$ solutions.

The f. p. data for cesium nitrate are compared with those of the

their, 1902, ii, 310), and his statement that this salt obeys the law of mass action cannot be entirely confirmed. E. G.

Ultramicroscopic Observation of a Temperature Coagula-

tion. THE SVEDBERG and KATSUJI INOUE (*Zeitsch. Chem. Ind. Kolloide*, 1911, 9, 153—154).—The influence of temperature on the precipitation of colloidal solutions of platinum in ethyl ether has been investigated by means of the ultra-microscope. When the number of particles observable in the ultra-microscope is plotted as a function of the temperature, two straight lines are obtained indicating a sudden change at $28-29^{\circ}$. This critical temperature agrees with that found previously as the result of microscopic observations.

H. M. D.

The Coagulation and Gelatinisation of Silicic Acid. Nicola

PORCHI (*Zeitsch. Chem. Ind. Kolloide*, 1911, 9, 161—175).—The influence of electrolytes and of sucrose, separately and conjointly, on the gelatinisation of colloidal solutions of silicic acid has been investigated, and in reference to these experiments the author discusses the mechanism of the gelatinisation process. The colloidal particles are supposed to consist of membranes having a capillary structure. In consequence of the negative charge on the particles, water cannot enter into the capillary network until means are provided for the removal of the charge. Neutralisation of the charge is effected in presence of electrolytes by the positive ions, and gelatinisation can then take place as a result of the intrusion of water. If non-electrolytes only are added to the colloidal solution, osmotic forces are unable to bring about gelatinisation, because of the impermeability of the membranes so long as the particles are electrically charged.

Experiments have also been made on the coagulation of silicic acid and colloidal ferric hydroxide. Quantitative measurements show that the oppositely charged colloids are precipitated in approximately constant proportions, excess of either remaining unchanged in the colloidal condition. The quantitative proportions appear to be related to the valencies of silicon and iron.

H. M. D.

Application of the New Theory of Allotropy to the System Sulphur. ANDREAS SMITS (*Proc. K. Akad. Wetensch. Amsterdam*, 1911, 14, 263—270).—As in the case of acetaldehyde, it is shown that the relationships exhibited by the equilibria between the different forms of sulphur can be accounted for if it is assumed that sulphur represents a pseudo-ternary system.

H. M. D.

Phenomena of Condensation for Mixtures of Carbonic Acid and Nitrobenzene in Connexion with Double Retrograde Condensation. PHILIPP KOHNSTAMM and J. CHR. REEDERS (*Proc. K. Akad. Wetensch. Amsterdam*, 1911, 14, 270—278).—The influence of nitrobenzene on the condensation of carbon dioxide has been examined, and data are recorded which show the pressures characteristic of the three-phase systems at different temperatures in the neighbourhood of the liquid-liquid plait points.

H. M. D.

Thermal Analysis of Quaternary Systems. II. PARRAVANO and G. SIKOVICH (*Atti R. Accad. Lincei*, 1911, ii, 331—337. Compare this vol., ii, 973).—A mathematical method for the problem of constructing the diagram of a quaternary system from the study of plane sections taken through a vertex of the tetrahedron and parallel to an edge.

Calculation of Equilibrium Constants from Conductivity Measurements. J. B. GOEBEL (*Zeitsch. physikal. Chem.*, 1910, 244—254).—The method described in the previous paper (*ibid.*, 1910, ii, 268) is extended to solutions of binary and ternary electrolytes in which polymerisation occurs. For the deduction of the numerous equations, the original paper must be consulted. As examples of binary electrolytes, organic acids are chosen, and in the case of acetic acid the concentration of double and triple molecules in aqueous solution is calculated. As an example of a ternary electrolyte, sodium sulphate is chosen. The value of $k = C_1^2 C_2$, where C_1 represents simple Na_2SO_4 molecules and C_2 double molecules, is calculated. It is shown in the last case that the molecular conductivities can be calculated from the formula.

Basicity of the Organic Acids Containing Alcohol, Hydroxyl Groups. G. CALCAGNI and LUIGI BERNARDINI (*Atti R. Accad. Lincei*, 1911, [v], 20, ii, 261—267, 309—312).—The authors have investigated the influence of alcoholic hydroxyl groups on the basicity of organic acids, the experimental method adopted being measurement of the conductivity of solutions of the acids (at different dilutions) during gradual neutralisation with a weak base (ammonia). The acids examined were glycollic, lactic, acetylacetic, butyric, hydroxyisobutyric, malic, tartaric, and citric acids, and the results are given in the form of tables and in curves, in which the ordinates are the specific conductivities and the abscissae the proportions of ammonia present. The curves of neutralisation first pass through a minimum, then rise until neutralisation is complete, and afterwards run parallel to the axis of abscissae. In the polybasic acids the pauses corresponding with the neutralisation of the individual carboxyl groups are not prominent. On the whole, the influence of the hydroxyl groups does not show itself at all in the curves, but this may be due to the considerable dilutions employed. All the acids dealt with can be titrated very well with phenolphthalein and potassium hydroxide.

The Alkalinity of Aqueous Solutions of Carbonates. FRIEDRICH AUERBACH and HANS PICK (*Arbeit. K. Gesundheitsamt*, 1911, 38, 243—274).—The alkalinity of aqueous solutions of sodium carbonate, sodium hydrogen carbonate, and mixtures of these salts in different proportions has been determined at 18° by a colorimetric method in which the colour effects produced by addition of various indicators are compared with the colours exhibited by standard solutions of known hydrogen ion concentration.

From the data thus obtained, the second ionisation constant of

carbonic acid, $k_2 = [H^+][CO_3^{--}]/[HCO_3^-]$, is found to be 6.0×10^{-11} . This is in agreement with McCoy's value (Abstr., 1903, ii, 413), and also with that yielded by the data of Shields (Abstr., 1893, ii, 418) and Koelichen (Abstr., 1900, ii, 395). The divergent constants given by the two latter authors are due to errors of calculation.

From the above constant, the degree of hydrolysis of sodium carbonate solutions of different concentration has been calculated. The hydrolysis of sodium hydrogen carbonate solutions is nearly independent of the concentration, and corresponds with $\{OH\} = 0.0015$ at 18° and 0.0025 at 25°, the concentration being expressed in millimoles per litre. In contrast with the large temperature coefficient indicated by these numbers, the degree of hydrolysis of sodium carbonate varies very little between 18° and 25°. H. M. D.

Velocities of Reaction of Acetone and Lutidone with Phenylhydrazine and Hydroxylamine Under Various Conditions. IWAN SCHÖTTLER (*J. Russ. Phys. Chem. Soc.*, 1911, 43, [189]–[194]).—The author's experiments were made in aqueous solutions at 16–18°, the concentrations of the ketone and phenylhydrazine or hydroxylamine being decinormal.

The progressive addition of small quantities of hydrochloric acid produces a continuous diminution in the velocity of interaction of acetone and phenylhydrazine.

Acetic acid first produces a very considerable fall in the velocity of this reaction, but as the proportion of the acid is increased, the velocity also increases until it attains approximately the original value in 100% acetic acid.

It has been found by Thiele and Schneider (Abstr., 1909, i, 929) that unsaturated cyclic ketones, similar in structure to lutidone, do not form phenylhydrazones, but combine with the phenylhydrazine. The author, however, confirms the statement of Petrenko-Kritschenko and Mosseschwili (Abstr., 1902, i, 190) that lutidone gives a phenylhydrazone.

The formation of lutidonephenylhydrazone is accelerated by hydrochloric acid, but in presence of acetic acid (10% or 40%) the velocity of the reaction is zero.

The interaction of acetone and hydroxylamine is retarded by sulphuric acid, but hastened by potassium hydroxide. The latter completely suppresses the reaction of ketones with phenylhydrazine. The velocity of reaction of lutidone with hydroxylamine is zero under all conditions (compare Petrenko-Kritschenko, and Stamoglu, Abstr., 1903, i, 197). T. H. P.

Case of Autocatalysis and Simultaneous Negative Catalysis. ANTONIO QUARTAROLI (*Gazzetta*, 1911, 41, ii, 64–69. Compare this vol., ii, 1086).—The reaction between nitrates and anhydrous formic acid is a process of autocatalysis in which nitrogen trioxide is the positive catalyst. Until a trace of this substance has been formed, the velocity of the reaction is very small, but the nitrogen trioxide cannot accumulate in quantity, because it also reacts with formic acid. In agreement with this view it is found that oxidising

agents, transforming the nitrogen trioxide into nitric acid, and negative catalysts. Traces of potassium chlorate, hydrogen peroxide, potassium permanganate, or carbamide hinder the reaction of hydrogen entirely, so that there results the paradox that oxidizing agents may prevent oxidation (compare *ibid.*, Abstr., 1896, ii, 469).

R. T. S.

Catalytic Esterification of Dibasic Acids in the Wet Way. JEAN B. SENDRENS and J. ABOLENC (*Compt. rend.*, 1911, 153, 881-884. Compare this vol., ii, 600, 637).—By heating a mixture of malonic acid (1 mol.) and alcohol (2 mols.) with 10% of its volume of sulphuric acid for an hour, the amount of ester formed is 67.5% or 82.4%, if twice the amount of alcohol is used. The yield is not increased by using 10% of sulphuric acid, but 5% of sulphuric acid, aluminium sulphate or potassium hydrogen sulphate may be substituted for the acid without impairing the result. In practice the yield is less, owing to the solubility of the ester in the washing liquid, but this loss is not so serious with the higher alcohols; thus, with alcohol (4 mols.) gave an actual yield of 75.4%, and isomyl alcohol (4 mols.) 85.6% of ester. With succinic or oxalic acid and methyl alcohol under the same conditions, the yields were practically the same. In the case of phthalic acid, it is necessary to employ 15% of sulphuric acid to obtain good results.

W. O. W.

Atomic Weights of the Dominant Elements. D. HENRICHS (*Compt. rend.*, 1911, 153, 817-818. Compare Abstr., 1893, ii, 317; 1907, ii, 945).—The author has previously elaborated a method for the simultaneous calculation of the atomic weights of all of the elements engaged in a particular reaction, and has published a résumé of over 1000 results derived from 340 reactions used for accurate atomic-weight determinations (Abstr., 1909, ii, 653). These are now classified according to their limits of precision. The first class consists of those determinations of the highest accuracy in which the maximum difference between the experimental and absolute values does not exceed 0.012; this comprises 454 values distributed amongst ten elements (O, Cl, Ag, C, Na, S, Br, H, Na, K). These are called the dominant elements, and in the author's opinion their true atomic weights are identical with their absolute atomic weights, the latter being whole numbers.

W. O. W.

The Cyclic Molecule. A New Hypothesis on Benzene Allotropy and Polymerism. ANIBAL CHACÓN (*Pamphlet*, pp. 44).—A theoretical paper in which a new hypothesis is put forward as to the constitution of benzene. The author gives the formula $(C_6H_6)_3$ for benzene, the molecule of which he considers as consisting of three "sub-nuclei" (a , b , c), corresponding with three molecules of acetylene, which mutually saturate one another.

In his formula the author considers that the *ortho*-position is 1:6, the *meta*-position 1:3 or 1:5, and the *para*-position 1:2. By his hypothesis he explains the fact of two isomeric benzene hexachlorides assigning to them formulæ II and III for α and β respectively.

He then proceeds to give structural formulæ for naphthalene

anthracene, and phenanthrene, and for heterocyclic compounds, such as pyridine, the pyrone derivatives, etc.

Finally, he deals with allotropy and polymerism, explaining the polymerism of cyanic acid into cyanuric acid, and of cyanogen into

paracyanogen by the formation of cyclic molecules. He explains the allotropy of oxygen, sulphur, phosphorus, etc., on the same lines, giving, for example, for red phosphorus formula IV.

Finally, he enunciates the following conclusions:

(1) A simple substance can exist in two or more states, differing from one another by the number of atoms which the molecule contains in each of the states.

(2) Certain compounds are capable of giving rise to other compounds, the molecules of which are formed by two or more primitive molecules mutually saturating one another, this saturation being produced by pre-existing unsaturated valencies, or, if saturated, by alteration in the direction of the valencies.

(3) The atoms or molecules of elements and the molecules of compounds mutually saturate one another in the cyclic form, when they are assembled to the number of three, to constitute an allotropic or polymeric molecule.

A New Funnel. II. PHILIP BLACKMAN (*Chem. News*, 1911, 104, 211).—The funnel previously described (this vol., ii, 796) is further improved by rounding off the bends (for example, where the neck of the funnel connects with the upper part) instead of having them sharp.

T. S. P.

A Funnel Support. II. PHILIP BLACKMAN (*Chem. News*, 1911, 104, 211).—The funnel support previously described (this vol., ii, 796) is better made of aluminium and not of glass.

T. S. P.

Simple Apparatus for Filtering under Increased Pressure. ALFRED LOHMANN (*Zeitsch. Biol.*, 1911, 57, 183--184).—The

apparatus consists of a strong cast iron vessel provided with a removable lid, which can be firmly fixed and through which a tube passes connected to a cylinder of compressed gas. In the lower part of the vessel is placed a filter plate, and the vessel narrows to a tube from which the filtrate can be drawn off. The pressure in the upper part of the vessel can be increased until the desired rate of filtration is obtained.

E. F. A.

Apparatus for Extraction at High Temperatures. SCHURAVLEV (J. Russ. Phys. Chem. Soc., 1911, 43, 1189—1190). The extractor consists of an annular expansion on the outside and near the top of a glass bell, which is supplied to a perforated annular tube placed beneath the mouth of the bell, into which the steam rises and thus heats the extracting liquid. If the latter requires a higher temperature than is thus attained, the steam may be superheated, whilst if a lower temperature is desired a portion of the steam is diverted by means of a three-way cock to a steam-delivery tube. In order that the condensed steam may not pass its way into the flask containing the extracting liquid, round the lower tube of the extractor is fitted a slightly conical, rubber disk which carries the water off to one side.

T. H. P.

Inorganic Chemistry.

Formation of Hydrogen Peroxide in the Electrical Discharge. ADOLPHE BESSON (*Compt. rend.*, 1911, 153, 877—879). Kernbaum's results (*Abstr.*, 1910, ii, 818) are considered incorrect, and might be attributed to formation of ozone or oxides of nitrogen. A more rigorous examination of the production of atmospheric hydrogen peroxide has been undertaken, employing conditions of temperature and pressure analogous to those obtaining in the higher regions of the atmosphere, and using a very dilute solution of potassium chromate, which is a specific reagent for hydrogen peroxide. Negative results were obtained on passing the silent electrical discharge through water vapour alone, below 0° and at 30—760 mm. In presence of oxygen, however, the production of hydrogen peroxide is very marked, but only at 385—770 mm. In presence of air, the results are less decisive, owing to formation of oxides of nitrogen which destroy the hydrogen peroxide. Nevertheless, the formation of this substance has been detected when the air was in large excess and in rapid circulation.

W. O. W.

Synthesis of Concentrated Hydrogen Peroxide by means of the Silent Electrical Discharge. FRANZ FISCHER and MAX WOLF (*Ber.*, 1911, 44, 2956—2965).—The authors describe a special apparatus by means of which oxy-hydrogen gas can be submitted to a silent electrical discharge, the gas pressure being maintained at 3 cm. of mercury. The discharge passes through a U-tube, which is cooled by liquid air. Under these conditions a yield of 2.25—2.56% of the total possible hydrogen peroxide was obtained, the yield being calculated on the quantity of oxy-hydrogen gas passed through the

U tube. No hydrogen peroxide was formed when the U tube was only cooled to -20° .

The pressure of 3 cm. was chosen, because the gaseous mixture is not then explosive. The next experiments were made at the ordinary pressure, in one case the gaseous mixture consisting of 3% hydrogen and 97% oxygen; in the other case, of 3% oxygen and 97% hydrogen. In the former case, ozone was alone produced, and in the latter case the percentage yield of hydrogen peroxide varied with the temperature. At 22° it was 6.4%; at -20° , 33.6—34.1%; at -80° , 54%, and at the temperature of liquid air, 59—87.5%. In one case, the hydrogen peroxide solution produced was 86.9% by weight. In these experiments 500 c.c. of the mixture took 1.5—3 hours to pass through the discharging apparatus.

When a mixture of 1 vol. of oxy-hydrogen gas and 4 vols. of carbon monoxide was submitted to the discharge in a tube cooled by a mixture of ether and solid carbon dioxide, the yield of hydrogen peroxide was 4%.

The authors find that the limits of explosibility of mixtures of oxygen and hydrogen at the ordinary pressure are: 5.45% hydrogen and 94.55% oxygen; 5.3% oxygen and 94.7% hydrogen, the percentages being expressed in volumes. T. S. P.

Products Containing Absorbed Iodine. LAMBERTO CORRADI (*Arch. Farm. speriment. Sci.*, 1911, 12, Reprint 13 pp.).—When animal charcoal is placed for twenty-four hours in solutions of iodine, this element is absorbed, and a certain amount is retained by the charcoal even after many hours at 120° . The charcoals prepared in this way contain (according to the solvent used) 1.87—7.56% of iodine, no trace of which is evolved on keeping. The iodine is slowly removed, however, by organic solvents for iodine, by water, dilute acid, and especially by dilute alkali and by animal tissues. Hence the iodine charcoal should be of service in medicine. R. V. S.

Formation of Ozone by Electrolysis with Alternating Current. EUGENEZ H. ARCHIBALD and H. VON WARTENBERG (*Zetsch. Elektrochem.*, 1911, 17, 812—816). Dilute sulphuric acid is electrolysed in a cooled U-tube with platinum electrodes. The anode consists of a short platinum tube of 1 mm. diameter fused into glass tubes and cooled by the flow of water through it. An alternating current, the strength of which can be varied independently, is passed between the electrodes in addition to the direct current used for electrolysis. The effect of the superposition of the alternating current is to depolarise the electrodes. The anode potential falls rapidly as the ratio between the strengths of the alternating and direct currents increases up to about 3, and more slowly thereafter. With the anodic current density 1.5 ampere per sq. cm., for example, the anode potential was reduced by 3 volts when the ratio of alternating to direct current increased from 0 to 4. The increase in the strength of the alternating current is accompanied by an extraordinary increase in the quantity of ozone formed at the anode. A very small fraction of the ozone is produced by the alternating current alone. The higher the current density the smaller is the effect of the superposed alternating current. The strength of acid which gives the largest

quantities of ozone appears to diminish as the current density increases. The most favourable conditions observed were: anode 0.333 sq. cm.; direct current 0.25 ampere, alternating current 1.5 ampere, sulphuric acid of density 1.478. The ratio of ozone produced by direct current was 0.37, but owing to the large quantity of electrolytic gas produced by the alternating current the resulting gases only contained 6.23% of ozone.

Reversible Light Reaction of Sulphur. ALBERT W. WELSH (*Zeitsch. physikal. Chem.*, 1911, 78, 208).—In a previous paper (vol. ii, 878) the heat of formation of S_8 has been put equal to the alteration of the free energy by light. This is not strictly justifiable but at present the data for accurate calculation of the free energy are not available.

A Simple Hydrogen Sulphide Apparatus. E. RAMES and H. FONDER (*Chem. News*, 1911, 104, 189).—The apparatus consists of two stout conical flasks fitted with rubber stoppers, and connected by a T-piece, one flask being inverted over the other; the projecting arm of the T is bent downwards. The top flask contains the iron sulphide resting on a wooden grid, previously soaked in paraffin wax, and the lower flask the acid. It is only necessary cautiously to invert the apparatus in order to get a flow of gas.

Industrial Preparation of Pure Nitrogen. GEORGES CHABOT (*Compt. rend.*, 1911, 153, 764-766 (Compare Abstr., 1906, ii, 10)).

—The apparatus for the separation of air into oxygen and nitrogen by a process of partial liquefaction and fractionation has been improved by arranging that the gaseous phase rich in nitrogen is liquefied in the colder liquid circulating at the base of the rectification column, instead of in the bath of oxygen. The liquid phase through which the gas passes then contains only 0.4% of oxygen, whilst the nitrogen escaping from the top of the column contains not more than 0.2% of oxygen, a degree of purity sufficient to meet the requirements of the cyanamide industry.

Behaviour of the Hydronitrogens [Nitrogen Hydrides and their Derivatives in Liquid Ammonia. I. Ammonolysis of Hydrazine Sulphate. ARTHUR W. BROWNE and T. W. B. WELSH (*J. Amer. Chem. Soc.*, 1911, 33, 1728-1734).—Franklin (Abstr., 1905, ii, 581) has drawn attention to certain reactions in which liquid ammonia acts in a manner analogous to that of water in hydrolysis, and for which he has therefore proposed the term "ammonolysis." Experiments have now been undertaken to investigate the behaviour of the nitrogen hydrides and their derivatives in liquid ammonia.

Hydrazine sulphate is decomposed by liquid ammonia at -33° in accordance with the equation: $N_2H_4.H_2SO_4 + 2NH_3 = (NH_4)_2SO_4 + N_2H_4$. The resulting solution of hydrazine in liquid ammonia may be decanted or filtered from the solid substance, which consists of ammonium sulphate or a compound of this salt with ammonia, and a method is thus suggested for the preparation of hydrazine from its sulphate.

It is shown that the same reaction takes place to a limited extent when hydrazine sulphate is submitted to the action of ammonia gas at the ordinary temperature. E. G.

Behaviour of the Hydronitrogens [Nitrogen Hydrides] and their Derivatives in Liquid Ammonia. II. Ammonolysis of Certain Hydrazine Salts. ARTHUR W. BROWN and A. E. HOCKMAN (*J. Amer. Chem. Soc.*, 1911, 33, 1734-1742. Compare preceding abstract).—The behaviour of hydrazine monosulphate, $\text{N}_2\text{H}_4\cdot\text{H}_2\text{SO}_4$, and of hydrazine oxalate, diselenate, and mono- and di-phosphate in liquid ammonia has been investigated.

It has been found that the monosulphate, dioxalate, and diselenate are decomposed with formation of hydrazine and the corresponding ammonium salts, whilst the mono- and di-phosphate are not affected. When hydrazine monosulphate is treated with ammonia gas at the ordinary temperature, ammonolysis occurs to some extent, and a liquid, consisting essentially of a solution of hydrazine monosulphate in free hydrazine, can be separated from the mixture by centrifugal action. E. G.

Behaviour of the Hydronitrogens [Nitrogen Hydrides] and their Derivatives in Liquid Ammonia. III. Action of Ammonium Trinitride on Certain Metals. ARTHUR W. BROWN and A. E. HOCKMAN (*J. Amer. Chem. Soc.*, 1911, 33, 1742-1752).—Ammonium trinitride can be prepared by passing dry ammonia into an ethereal solution of azoimide. When a solution of this salt in liquid ammonia is treated with lithium, sodium, potassium, calcium, or magnesium, vigorous action ensues with the formation of the respective trinitrides, and the liberation of ammonia and hydrogen in accordance with the equation: $\text{M} + \text{NH}_4\text{N}_3 \rightarrow \text{MN}_3 + \text{NH}_3 + \text{H}_2$. In the case of zinc, aluminium, and tin, no perceptible action takes place, whilst with platinum a very slow reaction occurs.

A modified form of the Schiff nitrometer has been devised for use in this work, in which weighed quantities of two solids may be brought together in liquid ammonia in absence of air and moisture, and the gases evolved may be collected, measured, and preserved for subsequent analysis; this also permits of the residual solid being weighed and preserved, or prepared for analysis. E. G.

New Method for the Preparation of Nitrous Oxide and its Application to the Analysis of Nitrates. ANTONIO QUARTAROLI (*Gazzetta*, 1911, 41, ii, 53-59. Compare this vol., ii, 1079).—Nitrates react with pure, crystallisable formic acid quantitatively, according to the equation: $2\text{KNO}_3 + 6\text{H}\cdot\text{CO}_2\text{H} \rightarrow \text{N}_2\text{O} + 10\text{CO}_2 + 5\text{H}_2\text{O} + 2\text{H}\cdot\text{CO}_2\text{K}$. The reaction affords a convenient mode of preparation for nitrous oxide, the gas evolved being collected over 20% potassium hydroxide solution at 40°. The gas is free from other oxides of nitrogen provided that the reaction is commenced by warming the mixture with a naked flame until the first bubbles appear. Gas is then rapidly evolved for some minutes without further heating. If the initial warming is gentle (for instance, in a water-bath at 25°), an intense

blue coloration appears, and red fumes are seen which are not produced when the warming is carried out quickly.

The method also permits of rapid and accurate estimation of nitrates, the procedure being as follows. In a test-tube provided with a gas delivery tube are placed 5 c.c. of formic acid and the weighed sample (about 0.2 gram) of nitrate. The reaction is commenced by sudden heating, as above described, and the gas is collected in a graduated vessel over mercury, a correction being applied for the air originally contained in the apparatus. From the volume of carbon dioxide and nitrogen, the percentage of nitrate can be estimated; the carbon dioxide is then absorbed by means of potassium hydroxide, and from the volume of nitrogen remaining, a second calculation is made as a check. The method has been tried for the nitrates of sodium, potassium, ammonium, calcium and lead, and experiments with chemically pure nitrates indicate an average error of about 0.3 in the nitrogen percentage found. It is recommended for the analysis of commercial sodium nitrate, the impurities in which do not affect the accuracy of the estimation.

R. A. S.

Crystalline Form of Nitrogen Sulphide. G. F. HUNTER and SMITH (*Min. Mag.*, 1911, 16, 97—99).—Crystals of nitrogen sulphide, N_2S_8 , prepared by F. P. Burt and F. L. Usher (Abstr., 1911, ii, 89), gave constants [$\alpha:b:c=0.8879:1:0.8480$; $\beta=89.37^\circ$] in close agreement with those obtained by E. Artini (Abstr., 1906, ii, 533). The crystals are, however, of a different habit, having the appearance of cubes with truncated edges and corners. The refractive indices (1.902 and 2.046 and 1.908) are near to those of rhombic sulphur.

L. J. S.

Oxidation of Arsenious and Antimonious Oxides. J. BISHOP and TINGLE (*J. Amer. Chem. Soc.*, 1911, 33, 1762—1763).—When arsenious oxide (0.5 gram) is boiled for twenty-six hours with 95% alcohol (3 c.c.) and water (5 c.c.), it is completely converted into arsenic acid. Antimonious oxide behaves in a similar manner.

E. G.

Quantity of Carbon Dioxide in the Atmosphere at Monte Video. JOHANNES SCHRODER (*Chem. Zeit.*, 1911, 35, 1211).—Ten thousand parts by volume of the air were found to contain from 2.7 to 3.30 volumes of carbon dioxide, the average quantity being 2.8 volumes. The largest quantities of carbon dioxide were found during June and July, 1908, and the smallest in February, 1909. The quantity tended to increase when the wind blew from the interior, and diminished during the sea breezes.

W. P. S.

History of Colloidal Silicic Acid. PAUL WALDEN (*Zetsch. Chem. Ind. Kolloide*, 1911, 9, 145—146. Compare Abstr., 1910, ii, 500).—A historical reference to the earliest observations on the solubility of silicic acid, and the behaviour of its solutions toward acids. Quotations are given from papers by Pott (1746), Baumé (1773), and reference made to the experiments of Meyer (1775-1780) and Bergman (from 1779 onwards).

H. M. D.

Diffusion of Neon through Hot Quartz. OWEN W. RICHARDSON and R. C. DITTO (*Phil. Mag.*, 1911, [vi], 22, 704-706).—A new glass tube, which had never contained any foreign substance, was exhausted and heated in the air for about an hour at 1000°. The gas retained in the tube was then drawn off and examined. It gave a faint blue argon spectrum, and showed the yellow helium line. After three hours' heating, the helium spectrum was fully developed, and the α line $\lambda = 5852$ was well marked. After being heated all night, the helium and neon spectra were both quite strong, but no sensible increase in the intensity of the argon spectrum could be detected.

From these experiments the author draws the conclusion that neon diffuses through quartz at about 1000°, but its coefficient of diffusion is smaller than that of helium. The first argon spectrum, which did not change in intensity with the time of heating, is attributed to traces of air absorbed by the walls of the tube before the heating commenced. H. M. D.

Volatilisation of Electrodes in a Tube of Neon. GEORGES CLAUDE (*Compt. rend.*, 1911, 153, 713-715. Compare this vol., ii, 602).—An account of experiments to explain the appearance of helium in luminescent tubes of neon apparently free from this gas. The tube employed was cross shaped, and had four copper electrodes. The current was passed between two opposite electrodes until a sufficient amount of copper had volatilised, and then between the remaining pair.

It was found that the first deposit gave 1 c.c. per gram of gas rich in helium on treatment with nitric acid, whilst the second yielded a gas in which neon was the predominant constituent. It follows, therefore, that the results described in a previous communication cannot be ascribed to a transformation of neon into helium, but were probably due to a selective action of copper for helium, whereby a concentration of this gas was effected to a sufficient extent to enable it to be recognised spectroscopically. Ramsay and Collie have conducted experiments leading to the same conclusion (private communication). W. O. W.

Rare Gases of Coal Mine Natural Gases. CHARLES MOUREU and ADOLPHE LEPAGE (*Compt. rend.*, 1911, 153, 817-849).—Analyses of five natural gases from mines are given. The amount of helium and neon varies between 0.0003 and 0.05%, and that of argon (with traces of krypton and xenon) from 0.003 to 0.01% by volume. The relative proportions of the inert gases are about the same as in other natural gaseous mixtures. W. O. W.

Solidification of Aqueous Solutions of Metallic Chlorides. ALEXANDER W. SPERANSKY and A. PAVLOVA (*J. Russ. Phys. Chem. Soc.*, 1911, 43, 1006-1022).—The authors have investigated the compositions of the crystals obtained on freezing solutions of sodium, potassium, calcium, and magnesium chlorides of varying concentration and containing different proportions of sodium hydroxide or hydro-

chloric acid (compare Roozeboom, "Die heterogenen Gleichgew.", 2, 222; Ballé, Abstr., 1910, i, 355).

With NaCl-HCl solutions, it is found that, in the more concentrated solutions, the ratio between the amounts of chlorine in the separated ice of sodium chloride and hydrogen chloride respectively is the same, both for the solid separating and for the mother liquor. With dilute solutions, however, the value of this ratio is much greater for the solid than for the mother liquor. Similar relations are observed with NaCl-NaOH, KCl-HCl, and CaCl₂-HCl solutions.

With MgCl₂-HCl solutions, even when concentrated, the same ratio of magnesium chloride in the ice is observed.

It was found, however, that the concentration has no marked influence, the principal part being played by the consistency of the separated ice, which is in hard masses from concentrated solutions and in a friable condition from dilute solutions when slowly cooled. That this is the case was shown by cooling two solutions of the same composition in such manners that they gave the two kinds of ice.

These phenomena are regarded as being due to adsorption effects.
T. H. P.

Preparation of Lithium Persulphate. C. NICOLLE (Zeit. Elektrochem., 1911, 17, 919).—The attempt was made to prepare lithium persulphate by electrolysis of a solution of lithium sulphate in sulphuric acid at -20°, but although the persulphate was obtained in solution, it could not be separated in the solid form. An alternative method was therefore used. Persulphuric acid was prepared by electrolysis of sulphuric acid in the usual way, the sulphuric acid removed as the barium salt, lithium carbonate added to the persulphuric acid thus obtained, and the filtered solution evaporated in a vacuum. The pink, crystalline product contained about 82% of lithium persulphate, the remainder being lithium sulphate. The pure persulphate was not obtained.
G. S.

Preparation of Ammonium Salts from Nitrogen Compounds of Aluminium. BADISCHE ANILIN- & SODA-FABRIK (D.R.P. 235875).—When aluminium nitride is heated with sulphuric acid (or aluminium sulphate) and water, the following reactions take place:

The products can be employed as manure, and the reaction has been extended to the production of ammonium acetate and nitrate by employing acetic acid or nitrous gases respectively in this operation.

F. M. G. M.

The Ternary System Zinc-Lead-Tin. MARIO LEVI-MALAN and O. CECARELLI (Gazzetta, 1911, 41, ii, 269-282).—From the thermal study of numerous mixtures of zinc, lead, and tin, the authors have constructed the thermal diagram of this ternary system. The acidocaloric form of the gap of miscibility resembles those given by Wright (1873), and von (Abstr., 1891, 267). The ternary eutectic separates at 180°C. and Bergman corresponds with a mixture of 5% of zinc, 24% of lead, and

of tin. The alloys were also studied microscopically, and photographs are given of the appearances presented. R. V. S.

Alloys of Zinc, Lead, and Tin. MAURO LEVI MAIVANO and CARLO GELI (*Gazzetta*, 1911, 41, ii, 314—318).—In view of the importance of alloys of these metals for industrial purposes, the authors have determined the hardness (with Brinell's apparatus, using a pressure of 500 kilograms) of the ninety-seven alloys prepared in the course of the work described in the preceding abstract. The results are recorded in a diagram, so that the connexion between hardness and composition can be seen, and it is pointed out that three alloys, according to Hürns, are employed for anti-friction purposes, namely in the area of alloys from which zinc crystallises first, but are very near the zinc-lead eutectic, and microscopically consist of long needles of zinc disseminated in a mass of the binary eutectic containing little of the tertiary eutectic. R. V. S.

The Alloys of Tellurium with Zinc. MAIUSUKU KOBAYASHI (*Proc. Coll. Sci. Eng. Kyoto*, 1911, 3, 217—221).—Tellurium and zinc form a single compound, TeZn , which melts at 1238.5° , and has 10° C. The two eutectic points practically coincide with the pure components. The freezing-point curve falls steadily from the compound to tellurium, but alloys richer in zinc lose zinc so rapidly by oxidation that it is not possible to determine the course of the curve, although the zinc eutectic arrest is well marked. In microscopical examination the compound appears in needles. C. H. D.

The Ternary System Copper Silver Gold. ERNST JANKECK (*Zet. physik.*, 1911, 8, 597—606). The freezing point of gold is rapidly lowered by the addition of silver, and does not, as stated by Roberts-Austen and Rose (*Proc. Roy. Soc.*, 1903, 71, 161), remain exactly constant up to 50% Ag. The curve is a smooth one, slightly convex upwards, and the interval of crystallisation is over more than 13° . The majority of the ternary alloys form homogeneous, solid solutions, the range within which duplex structures are observed being defined by the eutectic line, which runs from the eutectic point of the copper-silver alloys at 69.2 atomic % Ag and ends at a point corresponding with 12.5 atomic % Cu, 55% Ag, and 24.0% Au, at a temperature of 899° . The curve separating homogeneous and heterogeneous alloys passes through this point and through the limiting concentrations of the two copper-silver solid solutions. These results are confirmed by microscopical examination. C. H. D.

The Corrosion of Metals. PERCY LONGMUIR (*J. Iron Steel Inst.*, 41, 83, 147—169).—A deposit obtained from the atmospheric corrosion of brass contained 22.75% ZnO , 15.93% Cu_2O , 7.4% CO_2 , and 5.6% SO_3 , whilst another sample, due to corrosion by fumes from smelting gas, contained 36.18% SO_3 . Samples of iron rust, formed purely atmospheric corrosion, contained from 0.686% to 3.121% SO_3 , but from steel rails, especially when laid in tunnels, also showed a

high proportion of sulphur. Corrosion by sulphuric acid and brittleness in iron or steel.

Cerium-Tin Alloys. RUDOLF VOGEL (*Zeitsch. anorg. Chem.*, 1911, **72**, 319—328).—Metallic cerium reacts with most gases, and readily melted. If introduced into a carbon tube and heated, cerium and nitride are formed, and the metal does not yield a residue. By throwing a piece of cerium (93.48% Ce) into a carbon tube, and heating to 1200° without any protecting gas, fusion takes place and a homogeneous mass is obtained, giving an alloy with a freezing point of 830° (623°, Muthmann and Weiss). The cerium-tin alloys are prepared in the same manner. The freezing point increases with increasing amount of tin, reaching a maximum at 1135° for 30% Sn, corresponding with the compound Ce_2Sn . There is a local maximum at 1165° and 56% Sn, corresponding with the compound Ce_3Sn_2 , and a third at 1135° and 61% Sn, due to the compound Ce_2Sn . Microscopical examination is rendered difficult by the rapid tarnishing of the sections, even when polished and examined under petroleum. but it is possible to recognise the compounds as homogeneous, and to detect the eutectic structure in other alloys of the series. All the alloys containing less than 80% Sn are pyrophoric, especially those containing the compound Ce_2Sn , mere scratching with a hard object producing a shower of sparks. This compound has also the highest hardness, of about 6, is very unstable in air, and reacts vigorously with water. (C. 1111)

The Ferromagnetic Compounds of Manganese with Phosphorus, Arsenic, Antimony, and Bismuth. SIGMUND HILPERT and THEODOR DIECKMANN (*Ber.*, 1911, **44**, 2831—2837).—*Manganese phosphide*, MnP , was prepared from manganese and phosphorus in a manner similar to that used for the arsenide (vol. ii, 985). It forms an inodorous, black powder, which burns on heating in the air, giving magnetic, black oxidation products. It is insoluble in hydrochloric acid, which acid may therefore be used to purify it; it is readily soluble in nitric acid.

Manganese antimonide, $MnSb$, was obtained by heating a manganese amalgam, prepared by electrolysis, with the requisite amount of antimony in an atmosphere of hydrogen, the mercury being then distilled off. It is a grey substance, which burns in the air, giving non-magnetic products; it is soluble in hot hydrochloric acid and readily soluble in nitric acid. *Manganese bismuthide*, $MnBi$, is prepared similarly to the antimonide, and has similar chemical properties; it is silver-white in colour.

The following are the temperatures at which the magnetic properties of these compounds are lost and regained, the first temperature denoting loss of magnetic properties on heating, and the second gain of the same on cooling; they indicate that hysteresis occurs: MnP , 18—26°; $MnAs$, 40—45°; $MnSb$, 320—330°; $MnBi$, 360—380°. The higher the atomic weight of the element combined with manganese the higher is the temperature at which the magnetic properties are lost. (T. 811)

The Thermal Formation of Potassium Manganate from Manganese Dioxide and Potassium Hydroxide. F. BAUM and H. SACKUR (*Zeitsch. anorg. Chem.*, 1911, 73, 101-124. Compare *Chem. Abstr.*, 1910, ii, 214, 215; this vol. ii, 491; Askew and Askew, *Abstr.*, 1910, ii, 297).—The dissociation pressure of manganates prepared by adding manganese dioxide to molten potassium hydroxide and pulverising the product have been measured. The dissociation pressure of manganese dioxide at 572° is 816 mm. From the values thus obtained, an isothermal dissociation curve is drawn at the temperature 661°, and the results show that the final product of dissociation is potassium manganite, K_2MnO_3 , which has no dissociation pressure, even at 1000°. Potassium manganate and manganite, however, form a solid solution, which is saturated when the atomic proportion of available oxygen to manganese is 1:1.6, corresponding with the composition $3K_2MnO_4 \cdot 2K_2MnO_3$. The formation of products further saturated than this is attributed to recombination. This degree of oxygen corresponds with Sackur's Mn_2O_3 and $Mn_2O_3 \cdot 8K_2O$. C. H. D.

Cementation of Iron by Solid Carbon. GEORGES CHARPY and J. BESSENOT (*Compt. rend.*, 1911, 153, 671-673. Compare *Abstr.*, 1911, ii, 215).—Iron was heated in contact with graphite at 950° at very low pressures in an atmosphere of hydrogen, nitrogen, and carbon monoxide containing about one third of the latter. When the pressure did not exceed 0.3 mm., no cementation occurred. Cementation, however, was very distinct if the pressure was allowed to rise to 1-1.5 mm.; after thirteen hours' heating under these conditions the iron was found to contain 0.5% of carbon and to show the perlite structure. These experiments explain the contradictory results of previous observers, who have not taken sufficiently into account the effect of small quantities of carbon monoxide. W. O. W.

Iron-Silicon-Carbon Alloys. W. GUTERMANN (*J. Iron Steel Inst.*, 1911, 83, 421-475).—The previous work on this system (*Abstr.*, 1910, ii, 851) has been extended. Increasing the percentage of silicon in cast iron accelerates the formation of graphite, but above 4-5% Si the temperature of reaction is so far lowered that the separation of graphite under ordinary conditions of cooling is diminished, becoming zero with more than 20% Si. C. H. D.

The Growth of Cast Irons after Repeated Heatings. HAROLD C. H. CARPENTER (*J. Iron Steel Inst.*, 1911, 83, 196-248).—The increase in external volume which takes place when cast iron is repeatedly heated in air is mainly due to disintegration caused by the oxidation of silico-ferrite. The distribution of the graphite affects the growth, by determining the access of oxidising gases. The presence of phosphide retards the oxidation. The higher the percentage of silicon in the iron, the greater the growth. When heated in a quartz tube in a vacuum, growth occurs owing to the escape of dissolved gases, and to a smaller extent, to the liberation of temper carbon from carbide. An iron containing 3.98% of carbon and 1.07% of silicon shows a growth

of 11% under these conditions, and becomes porous and more crystalline. Increasing the silicon diminishes the growth in a manner which becomes zero with 4% Si or more.

An alloy containing 2.66% C, 0.587% Si, and 1.64% Mn shows no growth after 150 beats. Its initial freezing point is 1143°C .

C. H. D.

The Influence of Vanadium on the Physical Properties of Cast Iron. WILLIAM H. HATFIELD (*J. Iron Steel Inst.*, 1911, 83, 318—331).—The addition of vanadium to cast iron favours the solution of the carbon in the combined condition, the greater part of the vanadium entering into the carbide and increasing its stability. With 0.65% of vanadium, the carbide remains undecomposed at 1100°C at 1919.

C. H. D.

Heat treated 3% Nickel Steels. ANDREW McWILLIAM and ERNEST J. BARNES (*J. Iron Steel Inst.*, 1911, 83, 269—293).—The pearlite point for steels containing 3% of nickel lies between 0.71 and 0.78°C . The point Ar_2 can be recognised as distinct from Ar_1 in steels containing 0.12, 0.28, and 0.30% of carbon.

C. H. D.

Influence of 0.2% Vanadium on Steels of Varying Carbon Content. ANDREW McWILLIAM and ERNEST J. BARNES (*J. Iron Steel Inst.*, 1911, 83, 294—317).—The pearlite point for steels containing 0.2% of vanadium lies between 0.71 and 0.78°C . The pearlite point is markedly irreversible, even in steels containing as little as 0.1% of vanadium. A part of the vanadium is in solid solution in the ferrite.

C. H. D.

The Chemical and Mechanical Relations of Iron, Chromium, and Carbon. JOHN O. ARNOLD and ARTHUR A. REMB (*J. Iron Steel Inst.*, 1911, 83, 249—268).—A series of alloys, containing 0.085% of carbon and variable quantities of chromium, have been examined. The ductility is increased by the addition of 5% chromium, and diminished by further additions up to 24%. Carbides have been isolated by electrolysis in hydrochloric acid. Practically the whole of the carbon in the annealed steels is retained as carbides, the proportion of chromium in the carbide increasing at first with the proportion of chromium in the steel, afterwards becoming constant. The constant product has the composition $2\text{Fe}_3\text{C}_3\text{Cr}_4\text{C}$, and is probably a double compound, crystallising as slate-coloured needles. Alloys containing less than 5% of chromium are pearlitic, whilst richer alloys consist of ferrite containing chromium, with distinct particles of a double carbide.

C. H. D.

The Influence of Impurities on the Corrosion of Iron. J. W. COBB (*J. Iron Steel Inst.*, 1911, 83, 170—195).—When the corrosion of iron is studied by means of the ferroxyl reagent (ANSTON 1909, ii, 485) it is found that solution of the iron is greatly accelerated by contact with ferrous silicate, black oxide scale, ferrous sulphate or iron phosphide or carbide. Graphite acts in the same manner.

Manganese sulphide is practically a non-conductor, and is without effect; and the behaviour of manganese silicate is similar. Manganese mixed with iron dissolves, the iron becoming the cathode. When two varieties of iron, such as Swedish steel and pure Swedish iron, are connected, any difference of potential between the two is found to be insignificant in comparison with the local currents, and corrosion takes place irregularly on both electrodes. When examined microscopically with the ferroxyl reagent, corrosion of ordinary iron is commonly found to begin at points where no recognisable impurity can be detected. These tests also show that manganese sulphide, like the silicate, does initiate local corrosion when present in microscopic particles.

C. H. D.

Cause of the De-rusting of Iron in Ferroconcrete.
 II. Two Chemical Processes Occurring in a Railway Tunnel.
 FR. RUTLAND (*Zeitsch. angew. Chem.*, 1911, 24, 2011-2012, 2014). A reply to Donath (this vol., ii, 897). The author rejects the explanation suggested by Michaelis, that the ferric oxide (rust) reacts with the lime of the concrete, forming a calcium ferrite, since he has not been able to detect any reaction between calcium hydroxide and ferric oxide, even after days.

II. In a railway tunnel at Hombach it has been found that when coming in contact with cement or concrete the latter must be protected as long as possible from the action of sulphurous acid formed during the combustion of the coal burned on trains passing through. During the setting of the cement, calcium hydroxide is formed by hydrolysis, and this would combine with the sulphurous acid, ultimately forming calcium sulphate and bringing about the destruction of the concrete.

The second chemical process referred to is the action of sulphurous acid on the old lime-mortar of the tunnel, whereby a plastic mass is formed, consisting of calcium sulphate and calcium hydrogen sulphate, the latter in the colloidal condition.

T. S. P.

Ore Deposition in Relation to Iron Sulphides. ERNEST L. ALLEN (*J. Washington Acad. Sci.*, 1911, 1, 170-177). Iron pyrites and marcasite are produced artificially by the action of hydrogen sulphide on ferric sulphate solution, the latter being first reduced to ferrous sulphate with the separation of free sulphur ($\text{FeSO}_4 + \text{H}_2\text{S} + \text{S} = \text{FeS}_2 + \text{H}_2\text{SO}_4$). This reaction takes place at the ordinary temperature, and the dark precipitate is minutely crystalline; at a higher temperature (about 200°), in a sealed tube, distinct crystals are produced. Determinations of the relative amounts of iron pyrites and marcasite present in these products were made by the method of H. N. Stokes (*Abstr.*, 1902, ii, 87); the results prove that higher temperatures and low degree of acidity favour the production of iron pyrites. At 100° in a solution containing 1% free sulphuric acid only marcasite is formed. Iron pyrites only is formed in neutral or alkaline solutions by the action of sodium polysulphide on a ferrous salt, or by the action of hydrogen sulphide on pyrrhotite and free sulphur. Marcasite when heated at 450° changes into iron-pyrites.

with development of heat; but this change is not reversible, iron-pyrites cannot be changed directly into marcasite. Pyrrhotite is formed by the decomposition of iron-pyrites in hydrogen, above 575°, more sulphur being lost at higher temperatures. The variable composition of pyrrhotite is explained by the variable amount of sulphur in ferrous sulphide, the formula being $(\text{FeS})_x\text{S}_2$.

The bearing of these experiments and temperature measurements discussed in connexion with the modes of occurrence in nature of these minerals, their probable modes of origin, and the conditions favourable for their formation. They are in harmony with the fact that pyrrhotite is formed near the surface from acid solutions, whilst iron-pyrites is formed in deeper veins from hot alkaline solutions; pyrrhotite, on the other hand, often occurs in igneous and contact-metamorphic rocks.

Experiments with Cobaltite. A. BETTELL (*Centr. Min.*, 1911, 663—673).—Experiments were made on the same line as those previously made with mispickel and glaucodote (see above, vol. ii, 485, 728), the mineral being heated in a vacuum before and after roasting. Cobaltite was found to be more stable than glaucodote under these conditions, and the annexed constitutional formula is suggested.

The crystallised cobaltite from Håkansbohn, Sweden, used in the experiments contained:

S.	As.	Fe.	Co.	Ni.	Ag.
21.48	42.88	2.92	32.36	9.32	1.04

L. J. S.

Equilibrium between Chloropentamminocobalt Chloride and Aquopentamminocobalt Chloride in Aqueous Solution. H. PERS (*Compt. rend.*, 1911, 153, 673—675).—The equilibrium between purpureo- and roseo-cobalt chloride in aqueous solution has been studied by boiling a solution of the former, and estimating the amount of the latter by precipitation as oxalate and the amount of precipitated chloride by means of silver nitrate. The equilibrium curves are reproduced, and show that two reactions occur simultaneously, corresponding with the equation:

the other involving decomposition of both products with formation of cobalt chloride. If no decomposition occurred, equilibrium would be attained when the mixture contained 42% of purpureo-cobalt chloride.

W. O. W.

The Exfoliation of Electrolytic Nickel. KARL ESCHER (*Zeitsch. Elektrochem.*, 1911, 17, 910—917).—Nickel electrolytically deposited from an acidified solution of pure nickel chloride or sulphate is obtained as a homogeneous coherent layer, whilst from ammoniacal solution the metal is obtained in a form which peels off in sheets when no iron is present. When a solution of a nickel salt containing iron is electrolysed, the iron deposits more easily than the nickel, so that the first layers are richer in iron than those deposited later on.

owing to this inequality in composition, the metal tends to split off in thin sheets. The influence of various factors on the composition of the layers has been investigated. With increase of temperature, the proportion of iron in the different layers becomes more nearly equal, and the ratio of the total iron in the alloy to that in the solution increases.

The hardness of electrolytic nickel is very little influenced by the nature of the salt, whether sulphate or chloride; it increases with increasing acidity of the solution, and is diminished by the addition of sodium salts to the nickel solution.

The elasticity of the metal obtained from sulphate solutions is greater than that obtained from chloride solutions. The addition of sodium salts to the electrolyte also increases the elasticity. G. S.

Alloys of Nickel and Zinc. ÉMILE VIGOROUX and A. BOURBON (*Bull. Soc. chim.*, 1911, [iv], 9, 873—879). Tafel has shown (Abstr., 1908, ii, 105), that nickel combines with zinc to form an alloy NiZn_2 , and this has been confirmed by Voss (Abstr., 1908, ii, 194). The authors find that two alloys exist, NiZn_2 and Ni_2Zn .

The ingots obtained were homogeneous when the amount of nickel was below 19%, at this stage they became brittle, and when the amount of nickel was largely increased, they became cavernous, porous, and more and more malleable. They were not magnetic up to 70.9% of nickel, but became magnetic at 72.8% of this metal. When pulverised and subjected to the action of hydrochloric or acetic acid, the residues from mixtures containing up to 18.3% of nickel became progressively richer in this element and developed magnetic properties. The residues from mixtures containing over 18.3% nickel showed little variation in composition as the attack progressed. Alloys containing less than 18% of nickel on treatment with nitric acid (1%) gave invariably a residue containing 18.6% of nickel, corresponding with the alloy NiZn_2 , which was isolated in this way as a crystalline, non-magnetic powder of density 7.71 and m. p. 850 (approx.). This was rapidly attacked by hydrochloric acid (1%), leaving a magnetic deposit which was sometimes pyrophoric; the solution generally contained zinc only. Dilute sulphuric acid attacked the alloy slowly, forming a solution of the two sulphates, and depositing a magnetic powder. Nitric acid of more than 1% strength dissolved the alloy completely. Nickel chloride solution dissolved the alloy on warming, giving rise to one hydroxide and a magnetic deposit.

Determination of the *E.M.F.*'s developed by the use of poles formed of mixtures of the two metals against poles of zinc showed "breaks" at 1.33% and 72.92% of nickel, corresponding with the compounds NiZn_2 and Ni_2Zn respectively. T. A. II.

The Reactions in a System of Nickel or Platinum, Mercury, and Sodium Chloride. CHARLES A. PETERS (*Amer. J. Sci.*, 1911, iv, 32, 386—387).—When a solution of sodium chloride is left over mercury with a nickel wire connecting both liquids, crystalline nickelous hydroxide is formed very slowly, sodium hydroxide being produced at the same time. When platinum is substituted for nickel,

mercurous chloride is formed, sodium hydroxide being produced.

Chromic Sulphates and Ions. ALBERT COLSON (*Ann. Chim. Phys.*, 1911, [iv], 9, 862—868. Compare Abstr., 1907, ii, 267, 700).—The author has shown previously (*loc. cit.*) that some of the chromic sulphates give anomalous conductivity and cryoscopic measurements after heating and after dilution. To explain this, Recoura's suggestion that the violet sulphate undergoes polymerization and then hydrolysis, thus: $2\text{Cr}(\text{SO}_4)_3 + \text{H}_2\text{O} = [\text{Cr}_2\text{O}(\text{SO}_4)_6] + \text{H}_2\text{SO}_4$, and on thermochemical evidence supposed that a polymerization reaction occurred with the isomeric chromic sulphate. This suggestion has been called in question by Urbain as the result of his own work and that of Denham (Abstr., 1908, ii, 389). These authors suppose that when the violet sulphate is boiled, the polymer, $[\text{Cr}_2(\text{SO}_4)_6]2\text{SO}_4$, is formed, and is more or less hydrolysed without thermal decomposition. This explanation is improbable from what is known of polymerization; this composition (compare Recoura, Abstr., 1896, ii, 27, 700; and Abstr., 1907, ii, 177).

Uranyl Salts. III. ALEXIS M. VASILIEFF (*J. Russ. Phys. Chem. Soc.*, 1911, 43, 1183—1184. Compare Abstr., 1910, ii, 107, 108).—The author has determined the values of n_D^{20} and D_D^{20} of a series of aqueous solutions containing from 54.77% to 2.80% of anhydrous uranyl nitrate. The solution saturated at this temperature has approximately the composition, $\text{UO}_2(\text{NO}_3)_2 \cdot 1.911\text{H}_2\text{O}$, and has n_D^{20} 1.4177 and D_D^{20} 1.7536.

Alloys of Tin and Antimony. N. S. KONSTANTINOV and VLADIMIR A. SMIRNOFF (*J. Russ. Phys. Chem. Soc.*, 1911, 43, 1201—1220).—Investigations by the thermal method and by means of the electrical conductivity and its temperature-coefficient show that, after equilibrium is reached, the system Sn-Sb consists of (1) solid solution of tin and antimony, the limiting concentration being 10 atom. % Sb; (2) the definite compound, SnSb , capable of dissolving up to 56% Sb; (3) the definite compound, Sn_2Sb , capable of dissolving up to 41% Sb; and (4) solid solution of antimony in tin with a limiting concentration of 10 atom. % Sn.

Titanium. IV. ARTHUR STAHLER and FRITZ BACHMAN (*Z. phys. Chem.*, 1911, 44, 2906—2915).—An improved apparatus is described for the preparation of titanium trichloride, the glass cooler and quartz filter of the previous apparatus (Abstr., 1909, ii, 894) being replaced respectively by a copper cooler and a silindium tube; the latter heated directly by passage of the electric current.

When titanium trichloride is heated at 650°–700° in an atmosphere of hydrogen, the following reaction takes place: $2\text{TiCl}_3 + \text{Ti} = 3\text{TiCl}_4$. The tetrachloride is volatile, the dichloride remaining as a deep black powder; it was not quite pure, being contaminated with some metallic titanium. It begins to sublime at 300° in a vacuum.

The only satisfactory test for bivalent titanium is the formation of a red colour (due to $TiCl_2$) when mixed with an hydrochloric acid solution of titanium tetrachloride.

Titanium can be obtained by heating titanium dichloride at 1100° in a current of hydrogen, the reaction being $2TiCl_2 \rightarrow TiCl_4 + Ti$. A dark grey, spongy mass is obtained, which in the most favourable case contains 94.4% of titanium; the yield is not improved by heating the titanium dichloride in a vacuum.

The statement of Pfordten (Abstr., 1887, 14, 337) that titanium trichloride and titanium thiochloride ($TiSCl_3$) can be obtained by leading hydrogen sulphide into anhydrous titanium tetrachloride could not be verified. Derivatives of quadrivalent titanium are formed, mostly of the composition $TiSCl_4$. At $800-850^\circ$, hydrogen sulphide and titanium tetrachloride interact with the formation of titanium sulphide. The compound $TiSCl_2$ could not be reduced to the trichloride, TiS .

Titanium tetrachloride is reduced to the trichloride by heating with finely powdered aluminium, antimony, arsenic, or tin, in a sealed tube at 400° . Lower oxidation products of titanium could not be obtained by electrolysis of solutions of titanium tetrachloride in anhydrous hydrogen cyanide.

On mixing solutions of titanium trichloride and of sodium, potassium, or ammonium formates in the presence of air, olive green, microscopic needles of the double formates separate. They cannot be purified by recrystallisation from water, owing to hydrolysis, but must be washed successively with cold water, alcohol, and ether, air being excluded. The dry salts are relatively stable in the air. On being heated in the absence of air, some formaldehyde is produced.

Titanium ammonium formate,

Titanium potassium formate, $Ti(CHO_2)_3 \cdot 3Ti(CHO_2)_3 \cdot OH \cdot 2KCHO_2$. A lithium salt was also obtained in the impure condition. These salts are analogous to the acetates (Stahler and Wirthwein, Abstr., 1905, ii, 365); they may be used as mordants, owing to their ready hydrolysis in solution.

Titanium trichloride reacts with a gold solution in a similar way to stannous chloride, producing colloidal gold which is analogous to purple of Cassius. One part of gold in 20 million parts of water can be detected by this reaction.

T. S. P.

The Melting Point and Frequency of Atomic Vibration of Germanium. WILHELM BUTZ (*Zeitsch. anorg. Chem.*, 1911, 72, 313-318).—Experiments with two specimens of metallic germanium by the method formerly employed to determine the melting point of certain sulphides (Abstr., 1908, ii, 845), show that germanium melts in an atmosphere of hydrogen at $958 \pm 5^\circ$, but it saturated with oxide at $916 \pm 5^\circ$. It is not appreciably volatile in nitrogen at 1250° , but in the presence of some oxide, vapour is observed from 750° onwards. The oxide, GeO_2 , is not volatile at 1025° . The lower oxide, GeO , is volatile. The reaction, $GeO_2 + Ge = 2GeO$, does not take place under the conditions examined.

The frequency of atomic vibration, calculated from the volume, atomic weight, and melting point is 3.7.

Attempts to Prepare Bismuth Hydride. LUDWIG VON EMILIE ZOMMUSCH (*Arch. Pharm.*, 1911, 249, 483-493).—The attempts to prepare bismuth hydride gave negative results. Hydrogen was passed over alloys of lead, tin, and bismuth of these three metals with cadmium, heated to their melting point. Aluminium, zinc, iron, cadmium, or lead was added to a neutral solution of a bismuth compound. Bismuth in a bismuth zinc alloy was placed in dilute acid. Calcium hydride with bismuth compounds was moistened with water or aqueous solution of bismuth chloride.

Hydrogen was passed over mixtures of bismuth or bismuth with platinum black, nickel asbestos, or reduced nickel. Bismuth saturated with hydrogen was placed in a solution of bismuth sulphate or an electric current was passed through a cell containing bismuth sulphate in solution, and having an anode of palladium saturated with hydrogen and a cathode of platinum or a cathode of bismuth saturated with platinum.

Aluminium, activated by Wislicenus' method (*Abstr.*, 1896, i, 72), was allowed to remain in bismuth mannitol solution or with a mixture of bismuth and bismuth oxide, or in solutions of bismuth in ether or alcohol.

Hypophosphorous acid added to bismuth sulphate or to bismuth nitrate in solution gave only a precipitate of metallic bismuth. The presence of bismuth hindered the preparation of copper hydride by this method.

T. A. H.

Colloidal Gold. ALEXANDER GUTHRIE (*Zeitsch. Chem. Ind. Koloid.*, 1911, 9, 175-189. Compare *Abstr.*, 1902, ii, 610).—The influence of temperature on the nature of the colloidal gold solutions obtained by reduction of gold chloride by hydrazine has been examined in great detail. When small quantities of aqueous hydrazine are added to dilute gold solutions, blue hydrosols are produced at the ordinary temperature, whereas at 80°, 90°, and 100° the colour is red, or more usually reddish violet. The same result is obtained when the procedure is reversed by adding small quantities of the gold chloride solution to very dilute hydrazine, except that in this case violet hydrosols are occasionally formed even at the ordinary temperature. The addition of electrolytes or of gum arabic as protective colloid without influence on the nature of the products.

The colloidal solutions prepared at 100° are very sensitive toward electrolytes. The addition of a few drops of 0.1N-solutions at ordinary temperature gives rise quickly to a blue solution of colloidal gold.

H. M. D.

Dichloro-disulphaminoplatato-salts. The Stereoisomerism of Platinum and the Transformation of Sulphamic Acid. HEINRICH KIRCHREUTHER (*Ber.*, 1911, 44, 3115-3121). By the action of potassium platinochloride on sulphamic acid

potassium dichlorodisulphaminoplatinite have been obtained, the α -salt, $[\text{Cl}_2\text{Pt}(\text{NH}_2\text{SO}_3)_2]\text{K}_2 \cdot 2\text{H}_2\text{O}$, being yellow and readily soluble, whilst the β -salt, $[\text{Cl}_2\text{Pt}(\text{NH}_2\text{SO}_3)_2]\text{K}_2$, is almost colourless and more difficultly soluble. Both salts contain only the potassiums in the anionic condition and both are neutral, so that they cannot be structural isomerides in accordance with the formulae:

and $[\text{Cl}_2\text{Pt}(\text{NH}_2\text{SO}_3)_2]\text{K}_2$. Both salts dissolve in potassium hydroxide, giving an intense golden yellow solution containing a tetrapotassium salt; they must, therefore, be derived from the second of the above formulae, that is, they are platotrimines. Acids reprecipitate the salts from the solution in potassium hydroxide. The author considers them to be stereoisomerides, similar to the dichloroplatosamines, and from analogy to already known isomerides of platinum, the α -salt is characterised as the *cis* form,

and the β -salt as the *trans* form,

Potassium cis-dichlorodisulphaminoplatinite is obtained by the interaction of potassium platinochloride (1 mol.) and sulphamic acid (2 mols.) in cold aqueous solution. After keeping for twenty-four hours the solution deposits tabular, golden yellow crystals, which are weakly pleochroitic; they belong probably to the rhombic system, and are soluble to the extent of 1 part in 38 parts of water at 21° . $11\text{H}_2\text{O}$ is lost at 90° and $2\text{H}_2\text{O}$ at 130° . Barium chloride and hydrochloric acid give no precipitate, even on warming, proving that the sulphamic acid residue is in the inner complex sphere. Pyridine replaces the sulphamic acid from the residue, giving *cis*-dichloro-dipyridine platinum.

Potassium trans-dichlorodisulphaminoplatinite is obtained when more than 2 mols. of sulphamic acid react with 1 mol. of potassium platinochloride, the reaction being best carried out on the water-bath. After heating for two to three hours, the solution, on cooling, deposits a mass of almost colourless, felted needles, which dissolve in water to the extent of 1 part in 342 parts at 21° . The reactions of this salt are similar to those of the *cis* isomeride, except that pyridine gives *trans*-dichloro-dipyridine platinum.

Tetrapotassium trans-dichlorodisulphaminoplatinite,

is obtained by dissolving the above salt in potassium hydroxide and precipitating the solution with alcohol. It forms intense yellow, radiating clusters of prisms, and gives a strongly alkaline solution.

Potassium trans-dibromodisulphaminoplatinite,

and *potassium trans-di-iodo-disulphaminoplatinite*,

were obtained from the dichloro-compound by interaction with potassium bromide and iodide respectively. The former gives bright orange yellow prisms, whilst the latter forms reddish brown prisms.

Mineralogical Chemistry.

Atacamite. HENRI UNGERMACH (*Bull. Soc. franç. Min.*, 1911, 148—216).—A monograph of the species. In the new crystals the crystals (the axes b and c being interchanged) the axes are $a:b:c=0.87808:1:1.32710$. Many new crystal-forms are given. Crystals from Antofagasta, Chili, have D 3.769, 3.778, 3.779, 3.780, 3.781, 3.782, 3.783, 3.784, 3.785, 3.786, 3.787, 3.788, 3.789, 3.790, 3.791, 3.792, 3.793, 3.794, 3.795, 3.796, 3.797, 3.798, 3.799, 3.800, 3.801, 3.802, 3.803, 3.804, 3.805, 3.806, 3.807, 3.808, 3.809, 3.810, 3.811, 3.812, 3.813, 3.814, 3.815, 3.816, 3.817, 3.818, 3.819, 3.820, 3.821, 3.822, 3.823, 3.824, 3.825, 3.826, 3.827, 3.828, 3.829, 3.830, 3.831, 3.832, 3.833, 3.834, 3.835, 3.836, 3.837, 3.838, 3.839, 3.840, 3.841, 3.842, 3.843, 3.844, 3.845, 3.846, 3.847, 3.848, 3.849, 3.850, 3.851, 3.852, 3.853, 3.854, 3.855, 3.856, 3.857, 3.858, 3.859, 3.860, 3.861, 3.862, 3.863, 3.864, 3.865, 3.866, 3.867, 3.868, 3.869, 3.870, 3.871, 3.872, 3.873, 3.874, 3.875, 3.876, 3.877, 3.878, 3.879, 3.880, 3.881, 3.882, 3.883, 3.884, 3.885, 3.886, 3.887, 3.888, 3.889, 3.890, 3.891, 3.892, 3.893, 3.894, 3.895, 3.896, 3.897, 3.898, 3.899, 3.900, 3.901, 3.902, 3.903, 3.904, 3.905, 3.906, 3.907, 3.908, 3.909, 3.910, 3.911, 3.912, 3.913, 3.914, 3.915, 3.916, 3.917, 3.918, 3.919, 3.920, 3.921, 3.922, 3.923, 3.924, 3.925, 3.926, 3.927, 3.928, 3.929, 3.930, 3.931, 3.932, 3.933, 3.934, 3.935, 3.936, 3.937, 3.938, 3.939, 3.940, 3.941, 3.942, 3.943, 3.944, 3.945, 3.946, 3.947, 3.948, 3.949, 3.950, 3.951, 3.952, 3.953, 3.954, 3.955, 3.956, 3.957, 3.958, 3.959, 3.960, 3.961, 3.962, 3.963, 3.964, 3.965, 3.966, 3.967, 3.968, 3.969, 3.970, 3.971, 3.972, 3.973, 3.974, 3.975, 3.976, 3.977, 3.978, 3.979, 3.980, 3.981, 3.982, 3.983, 3.984, 3.985, 3.986, 3.987, 3.988, 3.989, 3.990, 3.991, 3.992, 3.993, 3.994, 3.995, 3.996, 3.997, 3.998, 3.999, 4.000. Previous analyses tabulated, and the following new ones are given. The rhombohedral form assigned to paratacamite (G. F. H. Smith, Abstr., 1909, 10, 100) is explained by twinning on $\epsilon(011)$ of atacamite according to the law of W. E. Ford (*Amer. J. Sci.*, 1910, 30, 16).

	Cl.	Cu.	Cr.O.	
Antofagasta	16.14	14.75	55.81	
Boleo	16.22	14.53	55.93	

L. J. S.

Schwartzembergite. G. F. HERBERT SMITH and GEORGE F. H. SMITH (*Min. Mag.*, 1911, 10, 77—83).—Crystals of schwartzembergite from the San Rafael mine, Sierra Gorda, Chili, are tetragonal (not rhombohedral) as previously stated, with $a:c=1:0.430$, and have the form of square pyramids with rounded faces. They are optically anisotropic, showing a division into sectors with optic axial angles $2V$ at 45° and 28° ; refractive index about 2.35. The colour is honey-yellow, brownish or reddish, and the powder is straw-yellow. Analysis, %:

Pb.	Cu.	Cr.O.	Cl.	I.	SO ₃	O and loss, S ₂
75.67	trace	0.67	7.96	8.64	0.47	[7.19] 7

The calcium sulphate is present as gypsum. Calculating this results as an oxychloriodide of lead (as done for previous analyses) there is still a deficit of nearly 4%. When the mineral is heated with hydrochloric acid, abundant chlorine is evolved, and in the cold with acid solution the iodine is present as iodate, and not as iodide. The formula is, therefore, written as $3(\text{PbCl}_2, 2\text{PbO}), \text{PbI}_2\text{O}_3$, representing a molecular compound of lead iodate with a lead oxychloride having the composition of mendipite. L. J. S.

Micro-structure of Magnetite. OTTO MÜGGE (*Jahrb. Min.*, 1911, 32, 491—534).—Etching experiments were made on crystals and plates of magnetite and of some other minerals of the spinel group, and a detailed description illustrated by many photomicrographs is given of the resulting etched surfaces. When a crystal of magnetite is placed in freshly fused potassium hydrogen sulphate it is only very slightly attacked, but at a higher temperature, when the free sulphuric acid has been largely expelled, there is an energetic action. An octahedral face of an etched crystal shows a shimmer in three positions. This is shown to be due to a regular orientation of small crystals of hematite on the magnetite, the basal plane of the former being parallel to the octahedral face of the latter. A similar result is

formed when magnetite crystals are heated in the air; and the pseudomorphs are shown to possess a similar structure. Hematite when heated in nitrogen at about 1500°, or in the presence of a reducing agent at the lower temperature of 700°, loses part of its capacity, and magnetite is developed on its surface in regular oxidation.

L. J. S.

A Ferriferous Dolomite from the Simplon Tunnel. G. VALLÉE LINCIO (*Atti R. Accad. Sci. Torino*, 1911, 40, 969--988).—The mineral was found about 4590 metres from the Italian end of the tunnel, and was deposited in association with calcite and other minerals. It has D 3.003 at 14–15°, and on analysis gave the following numbers:

CaO.	MgO.	FeO.	CO ₂	Total.
29.61	12.34	12.39	41.72	100.06

corresponding with the formula: $3\text{CaCO}_3 \cdot 2\text{MgCO}_3 \cdot \text{FeCO}_3$. The mineral is crystalline, and contains included many minute gaseous bubbles.

R. V. S.

The Distribution of Borates in Potash Deposits. WILHELM BERTZ and E. MARCUS (*Zeitsch. anorg. Chem.*, 1911, 72, 302–312).—The distribution of borates has been studied in the same specimens from the Stassfurt and Vienenburg deposits as have been already used for the estimation of nitrogen and of copper (Abstr., 1909, ii, 571, 1011) together with specimens from other German deposits. Special samples have also been analysed, taken from the immediate neighbourhood of the concretions of boracite, and at definite distances from them. The proportions found vary from 0.4% in some of the salt days to 0.01% in carnallite and kieserite, whilst the polyhalite region is free from borates. Most of the boric acid is found in the residue insoluble in water. Where lenses of rock salt are enclosed in carnallite, the veins contained in these lenses are much richer in borates than those of the typical older salts. No such regularity is found in the distribution of borates as in that of ammonia and bromine. The proportion of borates is slightly lowered in the immediate neighbourhood of boracite concretions.

The turmeric test is sensitive to 0.00005 milligram B_2O_3 in 1 c.c. The quantitative estimation is best performed by Wherry's method (Abstr., 1909, ii, 92).

C. H. D.

The Alunite-Beudantite Group. WALDEMAR T. SCHALLER (*Amer. J. Sci.*, 1911, [iv], 32, 359–364).—The minerals of this group (compare G. T. Prior, Abstr., 1903, ii, 377) are all rhombohedral, but they often exhibit optical anomalies. They fall into the following three sub-groups of sulphates, phosphates, and sulphato-phosphates, of which alunite, haunzite, and beudantite respectively may be taken as the types. The general formula is written $[\text{R}(\text{OH})_2]_2\text{R}'[\text{M}]_2[\text{N}_2]$.

Various incompletely-described minerals, which may possibly belong to this group, are discussed. It is suggested that goyazite is identical with haunzite; and utahite, carphosiderite and its aluminous variety

apatite, raimondite, pastreite, and cyprusite are all united under the name carphosiderite, with the new formula $3\text{Fe}_2\text{O}_3 \cdot 4\text{SO}_3 \cdot 7\text{H}_2\text{O}$.

Sub- phos- phates.	Phos- phates.	Sub- phos- phates.	Alunite	$[\text{Al}(\text{OH})_2]_2$	K_2	$[\text{SO}_4]_2$	$[\text{SO}_4]$
			Natrosulphate	$[\text{Al}(\text{OH})_2]_2$	Na_2	$[\text{SO}_4]_2$	$[\text{SO}_4]$
			Jarosite	$[\text{Fe}(\text{OH})_2]_2$	K_2	$[\text{SO}_4]_2$	$[\text{SO}_4]$
			Natropasteite	$[\text{Fe}(\text{OH})_2]_2$	Na_2	$[\text{SO}_4]_2$	$[\text{SO}_4]$

with that in the above table). The formula of pharmacodolomite is written in the form $2(\text{H,K})_2\text{O} \cdot 3\text{Fe}_2\text{O}_3 \cdot 2\text{As}_2\text{O}_5 \cdot 7\text{H}_2\text{O} + 4\text{H}_2\text{O}$, so that this mineral may also belong to the hamlinite sub-group.

L. J. S.

Composition of French Phosphorite Minerals. WATSON, T. SCHALLER (*J. Washington Acad. Sci.*, 1911, 1, 151). Lacroix regarded the French phosphorites as mixtures of collophanite, dahllite (= podolite), and francolite (= staffelite), and he has ascribed the formulae to these species (Abstr., 1910, ii, 522, 720). A study of the published analyses leads to the following formulae as more probable:

Dahllite	$9\text{CaO} \cdot 3\text{P}_2\text{O}_5 \cdot \text{CaO} \cdot \text{CO}_2 \cdot \text{H}_2\text{O}$
Francolite	$9\text{CaO} \cdot 3\text{P}_2\text{O}_5 \cdot \text{CaF}_2 \cdot \text{CO}_2 \cdot \text{H}_2\text{O}$
Collophanite	$9\text{CaO} \cdot 3\text{P}_2\text{O}_5 \cdot \text{CaO} \cdot \text{CO}_2 \cdot \text{H}_2\text{O} + \text{H}_2\text{O}$

L. J. S.

Herderite Crystals from Auburn, Maine. WILLIAM E. L. (Amer. J. Sci., 1911, [iv], 32, 283—286).—A crystallographic description is given of herderite crystals from Mt. Apatite, Auburn, Maine, which are of interest, in that some of them are untwinned and distinctly monoclinic, whilst others show the union of two individuals twinned on the basal plane, so producing the pseudo-orthorhombic forms characteristic of this mineral. The measured angles approach more closely those of Penfield (1894) for the hydro-herderite, $\text{Ca}[\text{G}(\text{OH})]\text{PO}_4$, from Paris, Maine, than those of Dana (1884) for the hydro-fluor-herderite, $\text{Ca}[\text{G}(\text{F},\text{OH})]\text{PO}_4$, from Stoneham, Mass. A partial analysis of the crystals gave, however, $\text{F} = 6.04\%$, $\text{H}_2\text{O} = 3.62\%$, proving the material to be hydro-fluor-herderite. The suggestion of Penfield that the angles of the crystals vary with the composition is therefore not supported. Penfield's angles are adopted for both varieties as being the most trustworthy.

L. J. S.

Hinsdalite, a New Mineral. ESPEER S. LARSEN, jun., and WALDEMAR T. SCHALLER (*Amer. J. Sci.*, 1911, [iv], 32, 251—255).—This new mineral occurs in considerable abundance at the Golden

Hinsdale Mine, near Lake City, Hinsdale Co., Colorado, where, together with quartz, it forms the gangue of a vein intersecting volcanic rocks. Associated minerals in the vein are barites, monopyrites, galena, tetrahedrite, and rhodochrosite. The hinsdaleite is granular and massed crystalline, with a dark grey colour and a vitreous to greasy lustre. Crystals are nearly colourless with a greenish cast; they have the form of cube-like rhombohedra ($pr = 91.18^\circ$) or of six-sided plates. There is a perfect cleavage parallel to the base, $il = 41^\circ$; sp. gr. 3.65. The crystals are zoned and exhibit optical anomalies; an optically uniaxial centre is surrounded by sectors with axial angles $E = 32^\circ$. Refractive indices, $\alpha = 1.670$, $\beta = 1.671$, $\gamma = 1.689$. Analysis (1901)

	SiO_2	CaO	Al_2O_3	SrO	FeO	H_2O	Total
(1901)	3.11	trace	56.47	14.13	14.1	1.25	109.21

corresponding with $2\text{PbO} \cdot 3\text{Al}_2\text{O}_3 \cdot 2\text{SrO} \cdot \text{P}_2\text{O}_5 \cdot 6\text{H}_2\text{O}$, named with 17.44% of the vanbergite molecule. The mineral is infusible and is practically insoluble in acids; its water is lost between 400° and 600° . Hinsdaleite therefore falls into the following isomorphous group:

Isomorphous

Vanbergite ..	$2\text{SrO} \cdot 3\text{Al}_2\text{O}_3 \cdot 2\text{SrO} \cdot \text{P}_2\text{O}_5 \cdot 6\text{H}_2\text{O}$	1 : 1 : 1 : 206.1
Hinsdaleite ..	$2\text{PbO} \cdot 3\text{Al}_2\text{O}_3 \cdot 2\text{SrO} \cdot \text{P}_2\text{O}_5 \cdot 6\text{H}_2\text{O}$	1 : 1 : 1 : 206.7
Chalkite ..	$2\text{PbO} \cdot 3\text{Al}_2\text{O}_3 \cdot 2\text{SrO} \cdot \text{P}_2\text{O}_5 \cdot 6\text{H}_2\text{O}$	1 : 1 : 1 : 212
Hollandite ..	$2\text{PbO} \cdot 3\text{Al}_2\text{O}_3 \cdot 2\text{CaO} \cdot \text{V}_2\text{O}_5 \cdot 6\text{H}_2\text{O}$	1 : 1 : 1 : 212

L. J. S.

Crystallised Variscite from Utah. WALTER M. T. SCHALLER (*J. Washington Acad. Sci.*, 1911, 1, 150—151). The bright green crystals from Lucin, Utah, are orthorhombic with a tabular habit or a form similar to those of the analogous minerals, scendite and strengite (phosphoserite). They are only slightly pleochroic, and have a mean refractive index of 1.560 and birefringence 0.032. All the water is lost at 160° , and the crystals become lavender coloured with strong pleochroism, mean refractive index 1.448, and birefringence 0.003. The dehydrated material is readily soluble in acids, whilst the green crystals are sparingly soluble. Analysis agrees with the usual formula $\text{Al}_2\text{O}_3 \cdot \text{P}_2\text{O}_5 \cdot 4\text{H}_2\text{O}$:

	P_2O_5	V_2O_5	Cr_2O_3	Fe_2O_3	Al_2O_3	H_2O	CaO	Sp. gr.
(1901)	44.73	0.32	0.18	0.06	32.50	22.68	190.37	2.54

L. J. S.

Ferromerite and Tilasite from the Manganese-ore Deposits of India. G. F. HERBERT SMITH and GEORGE T. PRIOR (*Mon. Mag.*, 1911, 10, 84—96).—The new mineral ferromerite forms veins of pale pinkish-white or white material in the manganese ore (a mixture of braunite, hollandite, and pyrolusite) at Sitapur, Central Provinces. It is translucent with a greasy lustre, and is optically uniaxial and negative. One specimen showed a prism of 60° , proving the mineral to be hexagonal, and, as seen from analysis 1, isomorphous with apatite. Formula: $3\{(\text{Ca}, \text{Sr})_2(\text{P}, \text{As})_2\text{O}_{10} \cdot \text{Ca}(\text{OH}, \text{F})_2\}$.

	As_2O_5	P_2O_5	F.O.	CaO	SiO_2	M.O.	F.	H_2O	Insol.	O for F.	Sp. gr.
(1)	25.23	29.11	—	44.34	9.23	—	0.89	112.00	0.68	109.17	3.518
(11)	29.35	0.43	0.55	25.65	0.66	18.34	7.18	0.73	0.65	109.35	3.77

Total loss

Tilasite occurs as pale green, translucent to opaque crystals, somewhat resembling apatite in appearance, in a quartz-bearing rock traversing the manganese-ore, and in a quartz-spar-bearing rock; both occurrences are at Kajidongri, Jhabua. The crystals are monoclinic [$a:b:c=0.7593:1:0.8391$]; $\beta=90^\circ 52'$ are of interest in belonging to the clinohedral class, the bc plane of symmetry, but no axis of symmetry. The optic axis is perpendicular to the plane of symmetry; $2V=82.44^\circ$; $n_p=1.660$, $n_m=1.675$ (Na). Analysis II gives the formula $(\text{MgF})\text{CaAsO}_4$. The identity of the mineral with fluor-adelite from Sweden (Sjogren, 1895) is discussed. L. J. S.

Analyses of Stibiotantalite. WILLIAM E. FORD (*Am. Jour. Sci.*, 1911, [iv], 32, 287—288).—In the analyses of stibiotantalite from San Diego Co., California (Pentfield and Ford, Abstr., 1906, 11, 1), the relative amounts of tantalum and columbium were estimated indirectly from the specific gravity of the mixed oxides, on the assumption that the composition and sp. gr. vary proportionally. It has been shown, however, by Foote and Langley (Abstr., 1911, ii, 71) that the curve obtained by plotting the sp. gr. against the composition is not quite a straight line; the oxides apparently form a solid solution, and do not exist together simply as a mechanical mixture. From the table of Foote and Langley a correction of 2% is to be made in the old analyses, which are recalculated in I and II. Under III are given the results of a new analysis of Foote and Langley:

	Ta ₂ O ₅	Cb ₂ O ₅	SiO ₂	Bi ₂ O ₃	Total	Sp. gr.
I.	13.00	37.30	42.28	0.53	100.11	6.70
II.	33.86	21.47	41.26	0.33	99.92	6.72
III.	41.92	16.19	40.25	0.69	99.06	6.70

L. J. S.

Trans-Baikal Minerals. S. D. KESNETZOFF (*Dull. Acad. Sci. St. Pétersbourg*, 1911, 897—901).—Descriptions are given of the following minerals.

Powellite, in crusts of white plates. Composition:

MnO ₂	CaO	Fe ₂ O ₃ .Al ₂ O ₃	SiO ₂	Total
70.05	25.10	3.45	1.80	100.50

The original powellite from Idaho contained 10.28% WO₃.

Bismuthospherite.—Two specimens: (a) greenish-brown, D 7.00, and (b) apple-green, D 6.86, gave on analysis, after allowing for insoluble residue:

Bi ₂ O ₃	CO ₂	H ₂ O	Total
90.13—90.19	9.23—9.11	0.64—0.70	100

Pure bismuthospherite, Bi₂CO₃, contains Bi₂O₃ 91.3, and CO₂ 8.7.

T. H. P.

A New Variety of Chrysocolla from Chile. HARRY F. KELLEY (*Proc. Amer. Phil. Soc.*, 1909, 48, 65—66).—Chrysocolla shows wide

variations in composition, and the colour ranges from bright green to blue. Analyses of green material agree with the formula

The following analyses are given of turquoise-like material occurring in shell-like crusts in a honey-combed, siliceous matrix from Panguipio, prov. Tarapaca, Chile. It is brittle, H = 3½, and is easily decomposed by acids without gelatinisation. The powder is grey-green. It blackens when heated, two-thirds (13.41%) of the weight being lost below 125°, and the remainder only at a red heat. The formula is therefore written as a hydrate $\text{La}_2\text{U}_2\text{Si}_2\text{O}_{12} \cdot \text{H}_2\text{O}$.

	CuO.	Al ₂ O ₃ .	FeO.	CaO.	MgO.	H ₂ O.	Total.	Sp. gr.
1253	28.85	9.58	1.78	1.64	8.4	1.1	50.34	2.632
1257	28.69	9.47	1.81	1.67	8.1	1.1	50.85	—

L. J. S.

Beryl and Rhodizite from the Pegmatites of Madagascar. (L. J. DUPARC, M. WUNDER, and R. SAKO, *ibid.* *Soc. franç. Min.*, 1911, 34, 131—139).—A crystal of beryl from Madagascar, of tabular habit and rich in faces, differs from those previously described from this locality (Abstr., 1910, ii, 312; 1911, ii, 736) in being much thinner and in its pale bluish-green (instead of rose-red) colour. $n_p = 1.5774$; refractive indices (Na light), $n_o = 1.5674$, $n_e = 1.5890$. Analysis 1.—These results confirm the presence in the Madagascar pegmatites of two types of beryl: one the ordinary aquamarine with prismatic habit and few crystal faces, low density and refractive indices, poor in alkalis, and without cesium and rubidium; the other of tabular habit parallel to the base and rich in faces, with higher density and refractive indices, and rich in alkalis, particularly cesium and rubidium:

	SiO ₂ .	Al ₂ O ₃ .	GdO.	MgO.	K ₂ O.	Na ₂ O.	Li ₂ O.	CaO.	Other.	Total.
1251	17.41	17.41	11.76	max.	9.98	2.95	1.59	0.71	0.14	55.94
1252	27.10	14.93	6.11	1.41	1.78	0.68	0.71	0.74	1.12	54.55

* B_2O_3 , by difference, 13.4%.

Rhodizite occurs in association with rubellite at Ampakite in the Sankara valley. The two crystals described have the form of the rhombic-dodecahedron with small tetrahedral faces; they are, however, pseudo-cubic and birefringent; refractive index (Na) 1.6935 (and 1.6922); D 3.344. The crystals are translucent with a vitreous lustre, and yellow with a tinge of green. Analysis II, corresponding with $\text{Li}_2\text{A}(\text{GaLiKCsRbNaH})_4\text{O}_{20}$, differs appreciably from Pisan's analysis (Abstr., 1910, ii, 57) of rhodizite from Madagascar.

L. J. S.

Samarskite, etc., from Madras. GEORGE HOWLETT TIPPER (*Ind. Geol. Surv. India*, 1911, 41, 210—213). Angular masses of samarskite, up to 200 lb. in weight, occur in a garnet-bearing pegmatite in the Sankara mica mine in Nellore district, Madras. On the conchoidal fracture it is black with a brilliant lustre; D 5.4—5.7. It is a columbate and tantalate of cerium and yttrium earths, with iron,

calcium, and very variable amounts of uranium. Associated with it are long, black crystals resembling allanite, but differing from them in containing 17.8% CaO , and 5.39% U_3O_8 ; it contains also iron, cerium earths; D 3.05. Another associated mineral is a hydrated zircon resembling cyrtolite, but containing some uranium. This occurs as sheaf-like groups of pale greyish-brown crystals, D 4.04. The following analysis corresponds with the formula $2\text{ZrSi}_2\text{O}_7 \cdot \text{H}_2\text{O}$. The powdered mineral is attacked by hot concentrated hydrochloric acid, and, after one hour, 15% is dissolved, all the iron and part of the zirconia going into solution:

ZrO_2	SiO_2	Fe_2O_3	CaO	etc.	MnO	U_3O_8	H_2O	Total
62.8	26.08	5.41	trace		trace	2.42	3.3	99.4

L. J. S.

Meteoric Iron from Currant Creek, Colorado. WILLIAM P. HADDEN (*Proc. Colorado Sci. Soc.*, 1908, 9, 79—80).—This mass of 596 lbs. was found about 1906 at Currant Creek, twenty-two miles south-west of Cripple Creek. It shows no Widmanstätten figures on a polished and etched surface. Analysis gave:

Fe.	Ni.	Co.	Mn.	Cr.	Cu, P, CaO, MgO .	S.
89.793	9.999	0.554	0.054	0.048	traces	Trace

L. J. S.

Chemical and Petrological Examination of the El Nakla Meteorite. STANISLAS MEUNIER (*Compt. rend.*, 1911, 153, 785—787).—This meteorite, which fell recently near Alexandria, shows a remarkably crystalline structure, and consists principally of fragments of hypersthene (83.34%) united by a cement soluble in hydrochloric acid. The hypersthene shows the macle structure, and contains inclusions of ilmenite. Analysis gave:

SiO_2	Al_2O_3	Fe_2O_3	CaO	MgO	K_2O and Na_2O	MnO	Total
47.40	0.69	20.80	15.20	14.61	0.05	0.85	99.60

W. O. W.

The Gas of the Boriferous "Soffioni" of Larderello. C. PORLEZZA and G. NORZI (*Atti R. Accad. Lincei*, 1911, [v], 22, 338—342).—A new analysis of the gas from this source has given results very similar to those of Nasini, Anderlini, and Salvadeo (Abstr., 1898, ii, 527). The principal differences occur in the case of the rare gases, for which more accurate methods are now available. The gas has the following composition:

CO_2	H_2S	CH_4	H_2	O_2	N_2	A.	He.	Total
92.2000	2.0000	1.7800	2.4500	0.1800	1.3500	0.0245	0.0155	100.000

The quantity of radium emanation in the gas amounts to 4.813×10^{-7} c.mm.
R. V. S.

Physiological Chemistry.

The Nitrous Oxide Method of Estimating the Quantity of Blood in the Body. I. MARKOFF, FRANZ MÜLLER, and NATHAN LUSTE (*Zeitsch. Balmatol., Klimatol. Kurort-Hygiene*, 1911, 4, Nos. 14, 15. Reprint, 16 pp.).—By allowing a person or animal to breathe a measured quantity of nitrous oxide and subsequently examining a sample of the blood, and estimating the tension of the gas in it, the total volume of the blood can be calculated. The difficulty of estimating the gas can be largely overcome by the use of the gas interferometer. The influence of bath treatment, climate, work, etc., on the blood volume is to be investigated by this method.

W. D. H.

Action of Extracts of Invertebrate Tissues on Blood-pressure. JEAN GAUTRELET (*Bull. stat. biol. d'Arcachon*, 1910, 13, 63—65).—The hepato-pancreas of the crab, and of *Maia*, contains one or more substances slightly soluble in alcohol which lower the blood-pressure of the dog when intravenously injected. Aqueous or alcoholic extracts of the genital glands are inactive. Among molluscs, extracts of the genital glands and of the liver in *Septa*, *Octopus*, and *Aplysia* (liver only) depress blood-pressure and diminish cardiac action. The same is true for echinoderms. In cases where depression of blood-pressure occurs, previous administration of atropine does not influence the result.

W. D. H.

The Size, and the Growth of the Blood in Tame Rats. R. A. CHRISOLM (*Quart. J. exp. Physiol.*, 1911, 4, 207—230).—The average oxygen capacity per kilo. of rats weighing from 50 to 150 grams each is 10 c.c., and the blood volume 63 c.c. The average hæmoglobin percentage is 86, and the number of red corpuscles 9 million per cubic millimetre. A fall in hæmoglobin, oxygen capacity, and blood volume occurs temporarily during the suckling period, and a fall in blood volume takes place in later life as the rate of growth diminishes. The oxygen capacity is less variable than the other factors mentioned. The volume of the blood is less variable than the weight of kidneys, liver, and spleen considered as percentages of the body-weight.

The volume of the blood in rats may be calculated by the formula $a \cdot 0.101$, and the total oxygen capacity by the formula $a \cdot 0.95/8$, where a is the body-weight.

W. D. H.

The Influence of Under-feeding on the Blood. ARTHUR E. BOYDORF and R. A. CHRISOLM (*J. Path. Bact.*, 1911, 16, 263—268).—Under-feeding with a diet deficient in protein does not necessarily cause any wasting of the blood in rats. It is suggested that this result throws some light on the duration of life of the red corpuscles.

W. D. H.

The Influence on the Blood of the Rat of the Presence of a Transplanted Sarcoma. R. A. CHISOLM (*J. Path. Bact.*, 1911, 16, 152—166).—Transplanted sarcomata in rats usually produce a diminution in oxygen capacity and in hæmoglobin percentage, which is parallel to the decrease in red corpuscles. The volume of the blood is increased. The anemia is usually accompanied by wasting of the tissues. The blood histologically shows signs of regeneration, but the mechanism of the blood destruction is unknown. In small tumours occasionally the oxygen capacity and the blood volume increase to meet the needs of the tumour. W. D. H.

The Fat-splitting Properties of the Blood and Serum of the Dog under Different Conditions. EMIL ABDERHALDEN and PIERO RONA (*Zeitsch. physiol. Chem.*, 1911, 75, 30—37).—The introduction of foreign blood into the circulation raises the fat-splitting power of the dog's blood, and especially of the serum. W. D. H.

The Individual Differences of the Red Blood-corpuscles on Hæmolysis. STEPHAN RUSZNYÁK (*Biochem. Zeitsch.*, 1911, 31, 394—396).—The author denies the correctness of the conclusions of Dienes (this vol., ii, 740), that the corpuscles show individual differences on hæmolysis, on the ground that Dienes has assumed that the dried matter of the blood-corpuscles contains 50% hæmoglobin, whereas Abderhalden has shown that they contain 77%. If Dienes' results be calculated on the latter assumption, his conclusions cannot be substantiated. S. B. S.

The Action of Selenium Salts on Red Blood-corpuscles. CHARLES O. JONES (*Bio.-Chem. J.*, 1911, 6, 106—109).—Sodium selenite does not produce hæmolysis outside the body, but does so after hypodermic injection. The cause of this is obscure. Sodium selenite is reduced to selenium in the portal circulation, chiefly in the spleen and liver. Only a proportion of the red corpuscles are hæmolyzed, suggesting that these from the portal system were mixed in the general circulation with those which are unaffected. Glycogen and sugar disappear in a remarkable manner after the injection, but whether this is a factor in hæmolysis is very questionable. W. D. H.

The Rate of Regeneration of Hæmoglobin after Hæmorrhage. ARTHUR E. BOYCOTT (*J. Path. Bact.*, 1911, 16, 269—275).—Rats regenerate hæmoglobin after hæmorrhage more quickly than rabbits, roughly in the proportion of three or four to one. Young rats and rabbits regenerate more quickly than adults. W. D. H.

The Enzymes of Leucocytes. M. TSCHERNOMUZKI (*Zeitsch. physiol. Chem.*, 1911, 75, 216—231).—The polynuclear leucocytes of the dog carry the following enzymes: protease, amylase, diastase, catalase, nuclease, and peroxydase, but not lipase. W. D. H.

Biotoxin. FRANCESCO MARINO-ZUCO, R. ONORATO, and L. GIUGLIANO (*Gazzetta*, 1911, 41, ii, 358—367. Compare Abstr., 1910, ii, 223, and this vol., i, 1049).—When its excretion by way of the kidneys is interfered with, biotoxin accumulates in the blood, but its quantity does not increase.

definitely, so that a part of the toxin must be eliminated in some way. The suppression of the renal secretion was effected in dogs in three ways; (1) by extirpation of the kidneys; (2) by cutting the ureters; (3) by producing an artificial nephritis. R. V. S.

The Acidity of the Gastric Juice of *Scyllium Stellare*. (Fraulein) H. A. VAN HERWERDEN and WILHELM E. RINGER (*Zeitsch. physiol. Chem.*, 1911, 75, 290—307).—Fraulein van Herwerden in her first paper showed that the Sjöqvist method was inapplicable to the investigation of the gastric juice of the dog-fish; the acidity is quite considerable, and she believed it might possibly be due to organic acid. A method was devised for testing this question with artificial juice, and found trustworthy. Applying it to the dog-fish juice, the conclusion is now reached that the major part of the acidity is due to hydrochloric acid; this was confirmed by actual analyses.

W. D. H.

Digestion of Casein. LOUIS GAUCHER (*Compt. rend.*, 1911, 153, 891—892. Compare Abstr., 1909, ii, 249, 236).—The experiments on dogs described in the earlier communications have been repeated on a boy, in whom, owing to the necessity of an operation, a fistula had been established at the opening of the jejunum. The curdling of milk in the stomach is not necessary to digestion, since a considerable amount passes into the intestine without having coagulated. The larger clots are broken up into much smaller fragments by the movements of the stomach; if the organ is incapable of effecting this, digestion may be hindered. No peptonisation occurs until the milk has passed the duodenum.

W. O. W.

Studies in Nutrition. I. The Utilisation of the Proteins of Wheat. LAFAYETTE B. MENDEL and MORRIS S. FINE (*J. Biol. Chem.*, 1911, 10, 303—325).—It has been held in the past that vegetable proteins are not utilised as thoroughly in the body as those of animal origin. The indigestibility of such proteins is largely due to unfavourable concomitant conditions, of which the most important is admixture with cellulose. In the present experiments such conditions were eliminated as far as possible, and it was found in men and dogs that gliadin (a commercial product, which is mainly gliadin, and is free from starch), gluten (also commercial), and the two characteristic proteins of wheat, gliadin and glutenin, are as thoroughly utilised as are the nitrogenous components of fresh meat.

W. D. H.

Studies in Nutrition. II. The Utilisation of the Proteins of Barley. LAFAYETTE B. MENDEL and MORRIS S. FINE (*J. Biol. Chem.*, 1911, 10, 339—343).—Under favourable conditions, barley protein, like that of the closely related cereal, wheat, would be almost perfectly digested.

W. D. H.

The Resorption of Gelatin from the Small Intestine. FELIX RACH (*Biochem. Zeitsch.*, 1911, 36, 498).—The author recalls his own experiments (Abstr., 1901, ii, 667), in which the time of action was

five and a-half hours, whereas in Minami's experiments (this vol. ii. 810) the time of action was only one hour.

Physiology of Digestion. IV. The Total Chlorine of the Animal Body on a Diet Rich in Chlorine. RUDOLF ROSEMAN (Pflüger's Archiv, 1911, 142, 447—458. Compare Abstr. 1911, ii, 1082).—The percentage of chlorine in the body of the normal dog is 0.112. On food poor in chlorine this falls. The present research deals with the effect of a diet rich in chlorine, and consists of experiments on two dogs. In the first, the feeding was continued for three weeks. The chlorine rose to 0.136%, but that of the skin was not greater than that of the body as a whole. In the second, the feeding was kept up for two months. The percentage in the whole body rose to 0.163%, and of the skin to 0.342%, which confirms the statement previously made concerning the skin as a chlorine deposit. The percentage in the blood was also high (0.308%).

W. D. H.

Physiology of Digestion. V. The Total Chlorine of the Human Fœtus. RUDOLF ROSEMAN (Pflüger's Archiv, 1911, 142, 459—460).—That the fœtus has a high percentage of chlorine is confirmed by the analyses recorded of a human fœtus 18 centimetres long. It contained 0.252% of chlorine.

W. D. H.

Chemistry of the Hen's Egg. KENJI KOJO (Zeitsch. f. anal. Chem., 1911, 75, 1—12).—The following analytical figures are given:

	White.	Yolk.
Water	87.71	49.73
Total solids.....	12.29	50.27
Ash	0.4	1.44
Organic solids.....	11.89	48.83
Total nitrogen.....	1.75	2.49
Dextrose	0.55	0.27

W. D. H.

Biology of the Egg, a Chemico-Anatomical Co-ordination. VINCENZO DIAMARE (Anat. Anzeiger, 1911, 40, 205—207).—The eggs of birds and reptiles contain dextrose, which is apparently formed from the living material present. The bulk of the paper is polemical against Salkowski, who, it is complained, has misrepresented the author's views on the part played by sugar in development.

W. D. H.

The Catalase of Sea-Urchin Eggs Before and After Fertilisation, with Especial Reference to the Relation of Catalase to Oxidation in General. SAMUEL AMBERG and M. C. WINTERMUT (J. Biol. Chem., 1911, 10, 295—302).—The fertilisation of sea-urchin's eggs leads to an increase of four to six times its cell oxidation, but this is not accompanied by an increase in its catalytic activity.

W. D. H.

Are the Oxidative Processes Independent Variables in Vital Processes? JACQUES LOEB and HARDOLPH WASTENBERG (Biochem. Zeitsch., 1911, 36, 345—356).—The experiments were

carried out with the eggs of sea-urchin (*Arbacia*), and the temperature-coefficients of oxidation and rate of development were determined. The latter was estimated by determining the time elapsing between fertilisation with the spermatozoa and the first bifurcation of the egg. The temperature-coefficients for both processes between 15° and 30° were found to be nearly identical (= about 2). The temperature-coefficient for the development rate increased with decreasing temperature, whereas that of the oxidation process remained nearly constant. The amount of sodium cyanide necessary to just inhibit development did not decrease the oxidative process by quite one-quarter of the total. This fact is in harmony with the discovery that the rate of oxidative processes is increased by about one-quarter by fertilisation. From these facts it can be understood why the temperature-coefficients of oxidation and development rate are no longer identical at lower temperatures. At temperatures above 32°, at which bifurcation is impossible, the oxidative processes also rapidly diminish. The results, without confirming the hypothesis that the oxidative processes are independent variables in the development of the egg, do not contradict it.

S. B. S.

Chemical and Physiological Examination of the Liver of Oxen. A. DANIEL-BRUNET and C. ROLLAND (*Compt. rend.*, 1911, 153, 900—902).—The bile of oxen gave the following analytical results, stated to be more complete than any hitherto published. The weights are in grams per kilogram of fresh material. The amount of bile from one animal varied, from 335 to 630 c.c. It had sp. gr. 1.024—1.027, and gave an extract, dried in a vacuum, of 90.3—90.5; dried at 100°, 88.5—93.5; at 110°, 86.80 to 89.60. Ash, 12.5—14.30; chlorides (as NaCl), 2.38—2.68; P_2O_5 , 1.31—1.58; Fe, 0.016—0.018. Nitrogen, 2.3—2.5; fat, 27.80—28.80; bile salts (sodium glycocholate and taurocholate), 15.30—15.80; nucleoprotein, 1.15—2.25; lipoids, 1.100—2.130. The latter contained cholesterol 0.410—0.813, with lecithin and neutral soaps 0.690—1.317. The livers of the same animals gave water, 689—755.20; ash free from carbon, 16.20—20.49; glycogen, 28.80—83.40; carbamide, 0.615—0.683; P_2O_5 , 2.90—3.48; chlorides (as NaCl), 1.95—2.86. The figures represent parts per 1000 of fresh substance.

W. D. W.

The Relationship between Nuclear Material and Development. ERNST MASING *Zeitsch. physiol. Chem.*, 1911, 75, 135—140).—The numbers given in connexion with the liver of rabbit embryos show that nucleic acid is more abundant relatively in early than in later stages.

W. D. H.

Bio chemical Relations of Various Lipoid Substances in the Liver. FREDERICK P. WILSON (*Bio.-Chem. J.*, 1911, 6, 100—105).—The acetone-insoluble fraction of the ether extract of the liver yields the most suitable antigen in the Wassermann reaction. Extracts made with cold and hot alcohol yield substances which differ from each other and from those in the ether extract in physical and biochemical properties, but these differences are apparently not dependent on the saponification or iodine values.

W. D. H.

Deamidisation. GERTRUDE D. BOSTOCK (*Bio-Chem. J.*, 1911, 5, 48—68).—Emulsions of liver and intestinal mucosa liberate ammonia from asparagine to a less extent than from glycine and leucine, and more than from alanine. This confirms Lang's statement, but no inhibition of the deamidising enzyme was found on adding an antiseptic. In the body the nitrogen of glycine appears quantitatively as urea in the urine within eight hours, whilst only 63% of asparagine nitrogen appears in the same time, whereas *in vitro*, ammonia is more readily liberated from asparagine than from glycine, that is, the amide nitrogen attached to the carboxyl group is more readily liberated than the amide group in the α -position.

W. D. H.

The Possible Vicarious Relationship between the Pituitary and Thyroid Glands. SUTHERLAND SIMPSON and ANDREW H. STEVENS (*Quart. J. exp. Physiol.*, 1911, 4, 257—272).—Complete removal of the thyroid in lambs from seven to eight months old and in adult sheep does not lead to the appearance of iodine in the pituitary even after so long an interval as five to six months. On the assumption that the active substance secreted by the thyroid is the one which contains iodine, no support is lent to the view, originally advanced by Rosenfeld, that there is a vicarious relationship between the two organs. In thyroidectomised animals the increase noted in the size of the pituitary body was not so great as has been reported by other observers.

W. D. H.

The Thyroid and Enzymatic Processes. A. J. JUSCHITSCH (*Zeitsch. physiol. Chem.*, 1911, 75, 141—168).—Removal of the thyroid in dogs and rabbits lessens the amount of catalase in all the organs investigated, including the blood; the amount of nuclease is also lessened. Administration of thyroid extract increases the catalase and nuclease, the inorganic phosphates of the blood, the antitryptic and hæmolytic power of the serum, and the appearance in the blood of materials which, together with the antigen from the thyroid, lead to a union with complement.

W. D. H.

Proteolysis in the Thymus of the Calf. NILS J. BOHNS (*Zeitsch. physiol. Chem.*, 1911, 75, 197—206).—Proteolytic changes occur more readily in the autolysing thymus if the reaction is acid than if it is alkaline or neutral. This apparently is not due, as in the spleen (Hedin), to the effect of acid in destroying an inhibitory substance. The proteolytic enzyme was obtained by perfusing the organ with 0.2% acetic acid; it is feebly antagonised by ox-serum, if the enzyme is prepared by a neutral (calcium carbonate) infusion, no such inhibition is noticed. Kaolin added in quantity sufficient to completely precipitate proteins leaves the enzyme prepared by either method largely in solution.

W. D. H.

Fatty Streaks in the Tunica Intima of Arteries. Oskar KLORZ and M. F. MANNING (*J. Path. Bact.*, 1911, 16, 211—226).—In this degenerative condition, which may occur in quite young people, the fat is deposited in the cells of the sub-endothelial layer, and the

endothelium may be but loosely attached; the elastic fibres also appear as though they were undergoing a fatty change, and the process may go on and involve the middle coat of the artery. The fat stained as neutral fat does; it was all dissolved out by alcohol and ether; sometimes the fat globules are anisotropic, and are therefore probably lipoid. The cause of this change, which primarily attacks the internal coat, is probably direct irritation by toxins produced by infection.

W. D. H.

Gas Production in Teleostean Fishes. W. N. F. WOODLAND (*Anat. Anzeiger*, 1911, 40, 225—242).—The structure of the swim bladder, and the very remarkable arrangements for its blood supply are described in full. In the process of oxygen secretion into the bladder, there is no hæmolysis of corpuscles, but the gas comes from what is in solution in the plasma. The use of a second remarkable of capillaries on the course of the returning venous blood is at present unknown.

W. D. H.

Stability of the Photogenic Material of the Lampyridæ and its Probable Chemical Nature. F. ALEX. McDERMOTT (*J. Amer. Chem. Soc.*, 1911, 33, 1791—1797. Compare Kastle and McDermott, *Abstr.*, 1910, ii, 1088; McDermott, this vol., i, 396).—A further study of the photogenic compound of *Photinus pyralis* and other *Lampyridæ* has shown that it is more stable towards atmospheric oxygen than is usually supposed, especially when it has been dried out of contact with the air. There can be little doubt that the luminous activity is the result of the oxidation of the photogenic compound, which is probably a lipoid (phosphatide) containing an unsaturated aliphatic radicle and an albuminous complex.

E. G.

A bibliography of the subject is appended.

Proteolytic Enzymes of Invertebrates. J. SELLIER (*Bull. stat. Ind. d'Arcachon*, 1910, 13, 67—205).—In the majority of cases, the juices are neutral or slightly acid; the acidity is insufficient for true peptic action, and in certain cases is due to amino acids. The hepatopancreas of *Helix* and *Aplysia* has no proteolytic action. The digestive juices of crustacea, cephalopods, and worms are creptic, readily liberating amino acids from proteins and proteoses. The juices of gastropod molluscs are inactive. Frequently rennetic action occurs, which runs parallel with proteolytic power. In many cases the liver appears to be an organ of absorption.

W. D. H.

The Surface-tension of Lymph. I. and II. GIUSEPPE BUGLIA (*Biochem. Zeitsch.*, 1911, 36, 411—420, 421—434).—(I) The blood of animals four to five hours after ingestion of food, and of fasting animals showed no marked differences in either the sp. gr. or surface-tension. On the other hand, the lymph, the surface-tension of which was not affected much by the ingestion of carbohydrates, showed a marked diminution after ingestion of proteins and fats (as compared with the lymph of fasting animals). The sp. gr. also is lowered, whilst the percentage of total solids increases. The fats cause a greater lowering of

surface-tension than proteins. The significance of these facts as they bear on the method of resorption of food-stuffs is discussed. The surface-tension of lymph falls markedly in the first hour after food ingestion, and does not commence to rise again even after ten hours.

(II) By the same method it was found that alcohol is rapidly absorbed both from the stomach and small intestine, and enters the general circulation through the lymph and blood capillaries. Bile salts introduced into the stomach affect the surface-tension neither of the blood nor lymph. From the small intestine, on the other hand, they are absorbed and pass without change into the blood stream and lymph. Sodium soaps are absorbed in a similar way, whereas gelatin does not appear (except perhaps in very small quantities) to pass the small intestine unchanged. The rate of absorption of these various substances was also investigated, and it appears that alcohol enters the circulation most rapidly.

S. H. S.

Physico-chemical Investigations on Animal Liquids. VI. Chemical Reaction of Lymph. G. QUAGLIABIELLO (*Atti R. Acad. Lincei*, 1911, [v], 20, ii, 273—279).—The author has determined the reaction of dog's lymph: (1) by measuring the *E.M.F.* of a couple formed of the lymph and 0.01*N*-hydrochloric acid, the two liquids being united with potassium chloride solution (compare this volume, 962); (2) by observing how much alkali must be added to the lymph to give an alkalinity corresponding with $C_{OH} = 1 \times 10^{-3}$, or of acid to reach an acidity corresponding with $C_{OH} = 2 \times 10^{-4}$. The second estimation is carried out with the aid of two mixtures of phosphates and phosphoric acid which have that degree of alkalinity and acidity respectively; the same amount of indicator is added to the standard solution as to the lymph, and acid or alkali is added to the latter until it acquires the same colour as the standard solution (compare Walpole, *Abstr.*, 1910, ii, 541, 995). The dissociation constant of lymph considered as a base is from 0.3 to 2×10^{-12} , whilst the dissociation constant when it is considered as an acid is 0.6 to 1.9×10^{-14} .

R. V. S.

Physico-chemical Investigations on Animal Liquids. VII. Chemical Reaction of Bile. G. QUAGLIABIELLO (*Atti R. Acad. Lincei*, 1911, [v], 20, ii, 302—305. Compare preceding abstracts).—The measurement of the concentrations of H^+ and OH^- in the bile of various animals by the electric method shows that its reaction may be practically neutral or faintly alkaline or acid, the variations being possibly due to the condition of the animal. Measured by the titration method already described, the neutralising power of the bile appears to be well marked, although less than that of lymph or blood serum; the variations are considerable. Of three cases quoted, one is neutral, one alkaline, and one acid.

R. V. S.

The Behaviour of Sterile and Boiled Milk Towards Rennet and Acid. ALOIS KREIDL and EMIL LENK (*Biochem. Zeitsch.*, 1911, 36, 357—362).—Both boiled and sterile milk clot on treatment with rennet, if either the latter or the vessels in which the experiments are

carried out are not sterilised. Sterile milk (acidity 20-22) will not clot if treated with sterile rennet in sterile vessels. Touching the mixture with a non-sterile finger, or the addition of a few drops of ordinary milk, is sufficient to cause it to clot. The lactic acid bacillus develops best in slightly acidified milk (0.2-0.6 c.c. N/10-acid is 10 c.c. of milk). The addition of acid to the extent even of 2 c.c. to 10 c.c. of sterile milk in sterile vessels causes no precipitation, and no additional formation of acid at incubator temperature. S. B. S.

The Influence of the Cooling of Milk on the So-called Schardinger Reaction. ROBERT HERRI and H. SCHMID (*Biochem. Zeitsch.*, 1911, 33, 376-388).—In fresh milk, with few bacteria, the Schardinger methylene-blue-formaldehyde reaction is not an unalterable constant, but depends on the temperature at which the milk has been preserved. The reaction time is reduced by cooling the milk to 10° or lower. The same result is obtained whether the milk be cooled only to 10° or frozen. The authors have studied the conditions under which the changes produced by cooling may be made reversible. They assume that by the cooling of milk the fat is converted into two separable phases, the first being a change from the liquid to the solid condition, and the second being a change in the solid phase, whereby crystallisation processes play the main part. S. B. S.

The Ammonia of the Urine and its Relationship to Gastric Secretion. S. A. GAMMELTOFT (*Zeitsch. physiol. Chem.*, 1911, 75, 57-70).—The investigations on human beings described in this paper confirm Loeb's statement, that ammonia excretion falls after a meal. This indicates that ammonia production is regulated with the object of maintaining a constant concentration of hydrogen ions in the tissues. When after a meal hydrochloric acid is absorbed, it is neutralised by ammonia. W. D. H.

Creatinine Excretion in Man Under the Influence of Muscular Tonus. CORNELIS A. PEKELARING (*Zeitsch. physiol. Chem.*, 1911, 75, 207-215*).—The present observations on man confirm the results previously arrived at from experiments on other vertebrates, that in muscular tonus the chemical change is different from that associated with contraction. In the former case, creatine is formed as a product of nitrogenous metabolism, whereas in contraction it is non-nitrogenous substances which are utilised. W. D. H.

Protein Metabolism of the Fœtus. The Distribution of Nitrogen in the Maternal Urine and in the Fœtal Fluids Throughout Pregnancy. DOROTHY E. LINDSAY (*Bio-Chem. J.*, 1911, 5, 79-99).—The urine of the cow contains a large amount of allantoin and of hippuric acid; bullock's urine contains much less hippuric acid and amino-acids, whilst allantoin is almost entirely absent. Throughout the first half of pregnancy, the non-protein nitrogen increases in the fœtal fluids, but the amount of nitrogen per unit of weight of the fœtus decreases regularly. The fœtal fluids contain urea,

* *Proc. K. Akad. Wetensch. Amsterdam*, 1911, 14, 310-314.

allantoin, monoamino-acids, creatinine, and creatine together with small amounts of polypeptides, diamino-acids, and contain other nitrogenous compounds (which are absent in adult urine) of undetermined nature. Throughout pregnancy the main variation in the foetal fluids consists in a decrease in the proportion of urea and a corresponding increase in allantoin and amino-acids. The early allantoinic fluid, that is, the urine of the early foetus, shows as compared with the urine of the adult a low urea content, a high proportion of allantoin and amino-acids, and of undetermined nitrogen. The foetal metabolism differs from that of the adult in the less complete katabolism of protein, and a lesser activity of nuclear metabolism, as indicated by the amount of allantoin. The materials used in the research were obtained from sheep, goats, and cows.

W. D. H.

The Urine of Women Under Normal Conditions with Special Reference to the Presence of Creatine. R. A. KROG (Quart. J. exp. Physiol., 1911, 4, 293—304).—In women creatine is not an abnormal urinary constituent; it is always present immediately after menstruation, and often in the inter-menstrual period; it is present throughout pregnancy, and after parturition is temporarily increased. After menstruation and during pregnancy, ammonia and undetermined nitrogen increase, whilst urea diminishes in the urine. The existence of a correlation between creatinuria and the female sexual cycle also occurs in the bitch.

W. D. H.

The Maximum Production of Hippuric Acid in Animals, with Consideration of the Origin of Glycine in the Animal Body. A. I. RINGER (J. Biol. Chem., 1911, 10, 327—338).—Goats and rabbits have the power of eliminating hippuric acid containing more glycine than is preformed in the proteins they metabolise. As much as 38.4% of the total nitrogen of the goat is eliminated as glycine in hippuric acid. The ingestion of the benzoates increases the nitrogen eliminated, but not the urea; the increase is greater than is accounted for in hippuric acid. It is suggested that the large amount of glycine originates from the "extra destroyed" protein, and not from the protein which would have been metabolised if no benzoate had been given. The diet has no influence on the amount of hippuric acid eliminated. No synthetic production of glycine from glycolic acid could be determined. A suckling calf, fifteen days old, which had never received the glycine complex in its food, was in full possession of the power to synthesise hippuric acid and eliminate it in large quantities.

W. D. H.

Are Starch Granules Excreted by the Kidneys? J. VOIGT (Biochem. Zeitsch., 1911, 36, 397—400).—The author fed a normal individual on rice starch contained in a gel made from gelatin, and the urine voided during the twenty-four hours after the starch diet was examined. The various precautions taken to avoid any accidental contamination with starch granules are described in detail. He failed to find any trace of starch in the urine, a result which was not in accordance with those of Rahel Hirsch and of Veržár (this vol. ii, 744).

S. B. S.

Pancreatic Diabetes in Cold-blooded Animals. VINCENTO PHARMAN (*Arch. ital. biol.*, 55. Reprint, 11 pp.).—In frogs, removal of the pancreas produces intense glycosuria, which is usually fatal within a fortnight. Mere separation of the pancreas from the intestine, provided its blood vessels are intact, does not lead to this result. Frogs can also be rendered glycosuric by hypodermic injections of dextrose; the pancreas is not thereby altered histologically. Removal of both liver and pancreas does not produce glycosuria, but the animals do not usually survive this severe operation long.

In the dog-fish (*Scyllium catulus*), extirpation of the pancreas produces hyperglycemia, but no glycosuria. The kidney of this animal is not permeable to dextrose, and none passes into the urine even when large amounts are introduced directly into the circulation.

W. D. H.

Action of Barium and Calcium on the Heart. Extra Systolic Ventricular Tachycardia Experimentally Produced by Stimulation of the Accelerator Nerves. C. J. ROTHBERGER and HEINRICH WINTERBERG (*Pflüger's Archiv*, 1911, 142, 461—522).—One result of stimulation of the accelerator nerves of the heart in the dog is that extra beats of the ventricles are occasionally seen. After the injection of barium or calcium salts this always occurs, these salts increasing the irritability of the neuro-muscular mechanism of the heart. This occurs more readily on the left than on the right side. Strontium and magnesium salts are inactive in this direction.

W. D. H.

The Increase of Cardiac Activity Produced by Calcium. C. J. ROTHBERGER and HEINRICH WINTERBERG (*Pflüger's Archiv*, 1911, 142, 523—530).—Injection of small quantities of calcium chloride markedly increases the output of the cat's heart as measured by a stromuhr, without increasing its rate; the rate may be slightly lessened.

W. D. H.

Action of Barium Ions on the Heart. N. WERSCHNIN (*Arch. exp. Path. Pharm.*, 1911, 66, 191—204).—Barium ions, like substances of the digitalis group, have a systolic and diastolic action on the frog's heart when applied endo- or exocardially. There is, however, a quantitative difference due to the small power the barium ions have in penetrating the outer surface of the heart; the inner surface is more permeable. The effect is easily removed by washing out with pure Ringer's solution.

W. D. H.

Biology of the Metal Thorium. ARNOLD ROSSEL (*Arch. Sci. Phys. Nat.*, 1911, [iv], 32, 347—348).—Bolton has observed that if thorium is kept in sterilised water, bacteria, which can be developed by culture on gelatin, are formed on the surface of the metal. This result was not obtained with any of the ordinary metals. The author has completed this observation as follows: Thorium was mixed with sterilised sea-sand in proportions varying from 0 to 50%. These mixtures were then placed in sea-water in separate flasks, and into each there were put twelve to fifteen examples of a simple vertebrate animal (the fish *Lanceolatus*). After five months all the fish were

dead in the flask with no thorium, and there was a thick growth of algae. In the flask containing 50% thorium all the fish were dead, and there were practically no algae. In the intermediate flasks there was a gradation in the state of the contents. This seems to show that metal thorium is capable of destroying certain injurious germ-organisms endangering life.

W. G.

Biological Action of Thorium. WERNER VON BOLTON (*Zentralblatt Elektrochem.*, 1911, 17, 816—817).—Ordinary distilled water kept in closed sterilised vessels containing metallic thorium for six months contains micro-organisms capable of growing on nutrient media. No signs of life are found after one year. Comparative experiments with other metals showed no signs of life at all.

Amphioxus kept in well aerated sea-water containing sea sand, or mixtures of sand and thorium, died in five weeks with sand alone, with 10% of thorium, 10% of the fish were alive after three months, with 25% of thorium, 30% of the fish survived this time, whereas with 50% of thorium, 90% of the fish were still alive after seven months. Thorium oxide had a very much weaker effect.

The effect on the growth of plants of mixing from 10 to 50% of thorium with soil is also studied. Seeds germinate some days later, and the young plants die when half developed in the soil containing the metal.

F. F.

Investigations with Mesothorium on Animal Germ Cells, an Experimental Proof of the Idioplasmic Nature of the Nuclear Material. OSCAR HERTWIG (*Sitzungsber. K. Akad. Wiss. Berlin*, 1911, 39, 844—873).—Previous work by the author has shown that exposure of the male and female germ cells to the influence of radium emanations does not kill the cells, but when impregnation occurs, development is slowed, and gives rise to imperfect and distorted larvae. This effect is more marked the longer the exposure. Histological and other evidence is adduced to show that the emanations produce their effect by injuring the nuclei. The theory that the harm is produced by toxic products liberated by the cleavage of leucithin is discussed, but not agreed with. The present research continues and amplifies these conclusions by further experiments on the generative cells of frogs. The material used was mesothorium, the radioactivity in the specimens used being eight times greater than that of the radium bromide used in the previous experiments. The effects are much more pronounced. Exposure to the rays from fifteen to thirty seconds produces a marked effect, an effect the sensitiveness of which is compared to that of light on a photographic plate. The experiments confirm the doctrine that the nucleus has an idioplasmic nature, that is, contains the hereditary elements; objections to this view are discussed at length.

W. D. H.

The Action of Cholesterol and its Derivatives with Lecithin as Syphilitic Antigen and as Hæmolysein with Cobra Venom. CARL H. BROWNING and JOHN CRUICKSHANK (*J. Path. Bact.*, 1911, 16, 225—246).—A full account of a research of which a preliminary notice has already appeared (this vol., ii, 1014).

W. D. H.

Pharmacological Properties of Certain Acid Oxidation Products of Cholesterol. FERDINAND FLURY (*Arch. exp. Path. Pharm.*, 1911, 63, 231—237).—The acids with formulae $C_{27}H_{44}O_8$, $C_{27}H_{44}O_9$, and $C_{27}H_{46}O_8$ (compare Windaus, *Abstr.*, 1908, i, 264) are strongly toxic, and are physiologically related to the pharmacological group of the bile acids and saponins. They are absorbed with difficulty, produce local necrosis of tissues, paralysis of skeletal and cardiac muscle, slowing of the heart, and intense hemolysis. In such properties they also closely resemble certain snake venoms, especially viper-venom. They may perhaps be intermediate products in the formation of bile acids from cholesterol, and formed in small amount may normally be important in the maintenance of muscular tonus.

W. D. H.

[Physiological Action of Iodo-fatty Acid Derivatives.] ERIC ANDERHALDEN and PAUL HIRSCH (*Zeitsch. physiol. Chem.*, 1911, 75, 35—56).—See this vol., i, 954.

Influence of Chemical Constitution on the Toxicity of Nitriles and Amides. ALEXANDRE DESGREZ (*Compt. rend.*, 1911, 153, 895—898. Compare this vol., ii, 756).—Comparison of the toxic power of a number of saturated nitriles and the corresponding unsaturated compounds towards rabbits and guinea pigs has shown that double or triple linkings increase the toxicity. A similar generalisation holds good for amides, and hence it is unnecessary to suppose that the great toxicity of unsaturated nitriles, such as the cyanoacetylenes previously studied, is due to fixation of water followed by liberation of hydrogen cyanide. The difference is less marked between saturated and unsaturated compounds in the aromatic series than in the aliphatic. Generally speaking, toxicity increases with the molecular weight, but the aromatic compounds are more poisonous than aliphatic substances of about the same molecular weight.

W. O. W.

The Action of Nucleic Acid on the Fermentative Processes in the Animal Body. M. TSCHERNOSCHKE (*Biochem. Zeitsch.*, 1911, 36, 363—375).—The sodium salt of yeast-nucleic acid (Merck's preparation) was administered in various ways (subcutaneously, *per os*, and intravenously) to a number of puppies from the same litter. One other animal received no treatment, and was kept as a control. The nucleate, even in large doses (1·5 grams to a kilo. of body-weight), exerted no injurious effect. At the end of a given period, after repeated administrations, the animals were killed, and the organs were removed from the body and dried at low temperatures. The amounts of the various ferments in the different organs were then estimated by the usual methods, and the results obtained in the treated animals compared with those from the control animal. The chief changes were observed in the brains, lungs, muscles, and thymus. In the case of the brain, the amylase was found to be 400 times greater than the normal, the diastase 4·4 times greater, and the protease 10 times. In the lungs, the diastase was 250 times greater than normal, and

6.4 times greater in the muscles. The results for other ferments and organs were not sufficiently definite for generalisation.

Pharmacological Properties of Adaline (a-Bromo- β -butyrylcarbamide). EDUARDO FILIPPI (*Arch. Farm. exp. Path. Pharm.*, 1911, 12, Reprint 10 pp. Compars Impens, *Med. Klin. Wien*, 1911, No. 47).—Adaline is a sedative producing light, but lasting sleep; it exerts no cardiac action, and its toxicity (for rabbits) is very small. Pancreatic extract dissolves the substance somewhat readily. The urine of animals (rabbits, dog) to which the substance has been administered contains some of it unaltered, but the urine also contains an acid, which forms acicular crystals, m. p. 87–89°, and contains bromine. Ionic bromine appears in the urine only in cases of severe poisoning.

R. V. S.

Pharmacology of the Bronchial Musculature. HANS JANUSCHKE and LEO POLLAK (*Arch. exp. Path. Pharm.*, 1911, 63, 205–220).—Intravenous injection of adrenaline increases the respiratory excursions of the lungs, especially when muscular asthma has been induced. The latter is due to cramp of the bronchial muscles, and this is antagonised by adrenaline. Bronchial spasm produced by injection of peptone (but not that produced by β -iminazolyethylamine [4- β -aminoethylglyoxaline] or ergotoxin) is also inhibited by adrenaline.

W. D. H.

Physiological Action of β -Aminoethylindole. PATRICK J. LAIDLAW (*Bio.-Chem. J.*, 1911, 6, 141–150).— β -Aminoethylindole is formed from tryptophan by bacterial action. It exerts a transient stimulant effect on the central nervous system, and has also a direct stimulant action on plain muscle, especially of the iris, uterus, and arterioles.

W. D. H.

Pharmacology of Veronal. I. Symptoms and Doses. CARL ROEMER (*Arch. exp. Path. Pharm.*, 1911, 66, 241–260).—A general account of the effects of veronal in frogs, rabbits, and cats, especially when used in fatal doses. The minimal fatal dose for the frog is 1.5 grams, for the rabbit 0.4 gram, and for the cat 0.3 to 0.35 gram per kilo. of body-weight.

W. D. H.

Pharmacology of Veronal. II. Influence on Temperature, Breathing, and Circulation. CARL JACOB and CARL ROEMER (*Arch. exp. Path. Pharm.*, 1911, 66, 261–295).—Veronal lowers the body temperature, somewhat slows the rate of breathing while increasing its depth, and lowers blood pressure by dilating peripheral vessels. The effect on the vessels appears to be mainly due to a local action of the drug. Larger doses are needed to affect the isolated frog's heart.

W. D. H.

Pharmacology of Veronal. III. Action of Veronal in Reference to its Specific Paralytic Action on the Vessel Walls. CARL JACOB (*Arch. exp. Path. Pharm.*, 1911, 66, 296–311).—This is largely a commentary on the preceding papers, written

mainly from the therapeutic point of view. The use of the drug is contra-indicated in cases where dilatation of the vessels should be avoided, for instance, in diseases of the kidney associated with venous congestion.

W. D. H.

Chemistry of Vegetable Physiology and Agriculture.

The Action of Certain Bacteria on Proteins. FRANCIS A. BAINBRIDGE (*J. Hygiene*, 1911, 11, 341—355).—When solutions of pure egg-albumin, serum-protein, or alkali-albumin are inoculated with the organisms, *B. coli*, *B. enteritidis*, *B. typhosus*, *B. proteus*, *E. pyocyaneus*, *Staphylococcus p. aureus*, and *Gonococcus*, the bacteria diminish in number when the seeding is large, but multiply to some extent when the seeding is small. The latter effect is probably due to non-protein nitrogenous substances, and not to the fact that bacteria use the protein as food. If any protein is used, it must be the smallest traces. The organisms examined (with the exception of *B. proteus*) do not break down appreciable quantities of egg- and serum protein, even in the presence of sufficient non-protein nitrogenous food to ensure vigorous growth.

W. D. H.

The Decomposing Power of Water Bacteria. WILHELM SPAT (*Arch. Hygiene*, 1911, 74, 237—248).—The amount of ammonia formed when 0.2 c.c. of a sample of water is added to 100 c.c. of 2% peptone solution, and incubation allowed to proceed at 37° for twenty-four hours, may serve as a criterion of the purity of the sample employed. The amount of decomposition does not bear any direct relation to the absolute number of bacteria, since those normally present in water are able to ammonify peptone only to a slight extent; this also applies to *Bacterium coli* and to pathogenic organisms generally. Contamination of the water by surface drainage introduces physiologically active soil bacteria, and is reflected in a greatly increased decomposing power of the sample in the majority of the cases investigated. Storage does not affect the decomposing power of the water, so that ice cooling during transit of the sample is unnecessary.

H. B. H.

The Action on Nitrates and Nitrites of Dysentery Organisms. W. J. LOGIE (*J. Hygiene*, 1911, 11, 361—372. Compare Abstr., 1910, ii, 988).—The organisms examined were killed (1) by temperatures which should not have destroyed the reducing enzymes; (2) by sodium fluoride and four other antiseptics, derivatives of phenol mentioned below, and (3) by acetone. In each case there was total destruction of the reducing power. Filtrates of fluid cultures have also failed to reduce nitrates to nitrites. The reduction cannot, therefore, be due to a soluble extra-cellular enzyme. The high antiseptic value of tetrachloro-*o*-diphenol, tetrabromo-*o*-cresol, *p*-chloro-*m*-cresol, and

hexabromodihydroxydiphenylcarbinol is established for many organisms. W. D. H.

Sugar Tests and Pathogenicity in the Differentiation of Streptococci. J. M. BEATTIE and A. G. YATES (*J. Path. Bact.*, 1911, 16, 247—256).—A full account of a research of which a preliminary notice has already appeared (this vol., ii, 1019). W. D. H.

The Mechanism of Alcoholic Fermentation. A. J. L. LEE DEFF (*Ber.*, 1911, 44, 2932—2942; *Bull. Soc. chim.*, [iv], 9, 1911, 1912).—A detailed description of the experimental evidence on which he founded the theory of alcoholic fermentation already given (*ibid.*, 1911, ii, 816). G. J. Y.

Alcoholic Fermentation. HARTWIG FRANZEN and O. STREIBER (*Ber.*, 1911, 44, 2915—2919).—The action of yeast on formic acid was determined by growing pure cultures in sterile beer-wort containing 0.01 molar sodium formate, and estimating the formic acid present at daily intervals. In most cases it was found that considerable quantities of formic acid disappeared. In several cases, however, a formation of this substance occurred during the early stages of the growth, which was followed by a gradual decrease as time went on. It was further found that when no formate was originally present in the wort, formic acid was first formed and then gradually fermented. The formic acid cannot all be derived from the alcoholic fermentation of amino-acids, since the quantity found was greatly in excess of that corresponding with the amyl alcohol and succinic acid produced in the fermentations.

The conclusion is drawn that it is formed as an intermediate product in the alcoholic fermentation of the sugar of the wort, the quantity found representing the balance between the amount formed and that fermented.

These experiments thus lend support to the theory of alcoholic fermentation of Wohl as elaborated by Schade, according to which lactic acid is formed from the sugar, and is then converted into acetaldehyde and formic acid, which react together to form carbon dioxide and alcohol. W. J. Y.

The Formation of Plasma Protein by Yeasts and Moulds. FELIX EHRLICH (*Biochem. Zeitsch.*, 1911, 36, 477—497).—It has been shown by the author and his co-workers that when yeasts, etc., act on amino-acids, alcohols, such as amyl alcohol, tyrosol, etc., are produced (according to the amino-acid used in the experiment), and that the amount of destruction of the amino-acid is proportional to the amount of alcoholic fermentation. The conclusion is drawn from the results, that the alcohols, such as amyl alcohol or tyrosol, which are derived from the amino-acids are merely waste products, and form no direct part in the protein synthesis of the yeast, which merely uses the ammonia set free. The latter substance acts on the degraded products of the dextrose only, to form the amino-acids which are concerned in the synthesis of the plasma protein. Experiments were

therefore carried out to determine whether yeast would grow in the presence of sugar degradation products only, with tyrosine as the source of nitrogen. This substance yields as reaction product either tyrosol or *p*-hydroxyphenyl-lactic acid, according to the mould used in the experiment. Both these substances can be readily isolated, and the ratio between the amounts isolated and the protein nitrogen formed in the yeast growth was estimated. Tartaric, lactic, and formic acids (as sodium salts), glycerol, methyl and ethyl alcohols were the degradation products of sugar employed. In the case of yeast the results were negative, but this was not so in the case of certain "wild" yeasts and moulds which were employed, namely, *Willia anomala*, Hansen, and *Oidium lactis*. The former yielded tyrosol, whereas the latter yielded *p*-hydroxyphenyl-lactic acid. Positive results were obtained with ethyl alcohol and glycerol, and, to a small extent, with methyl alcohol, and the amount of nitrogen in the culture was, in the case of the *Willia anomala*, more or less proportional to the amount of tyrosol recovered. In the case of the *Oidium lactis* positive results were also obtained with sodium lactate. Preliminary experiments carried out in a similar way with pyruvic acid also yielded positive results with *Willia anomala* and a brewer's yeast, although the latter only developed slowly in the artificial culture medium. S. B. S.

The Anti-bactericidal Action of the Bile Salts. S. LYLE CUMMINS (*J. Hygiene*, 1911, 11, 373—380). Sodium taurocholate and glycocholate possess anti-bactericidal qualities; glycine, taurine, and cholic acid have not. This explains why the addition of bile salts to culture media, such as serum, increases the growth of the typhoid bacillus. The action depends on interference with the complement, and not on inhibition of the action of the amoebocyte. The action of bile may explain the survival of the bacilli in typhoid carriers.

W. D. H.

Increasing the Activity of Higher and Lower Plants by Small Amounts of Poisons. EDWIN BROUX FRED (*Centr. Bakt. Par.*, 1911, ii, 185—245).—Ether, carbon disulphide, potassium dichromate, and copper sulphate promote the growth of lower organisms when sufficiently dilute solutions are employed. The organisms included *Azotobacter*, denitrifying, ammonia, and putrefactive bacteria, and yeasts. In presence of ether, the fixation of nitrogen by *Azotobacter* in mixed cultures is increased; with pure cultures, fixation of nitrogen is increased by ether and carbon disulphide, but not to the same extent as with mixed cultures. The growth of denitrifying organisms is slightly increased by antiseptics.

Application of ether to soil at first retards nitrification; subsequently nitrification is considerably increased. Experiments with plants showed that ether and carbon disulphide increase the growth.

The conclusion is drawn that the beneficial effect of these substances is due to their stimulating action on the plants and on soil organisms.

N. H. J. M.

Action of Ether and Carbon Disulphide on Higher and Lower Plants. ALFRED KOCH (*Centr. Bakt. Par.*, 1911, 31, 173—185).—The results of pot experiments in which *Barbarea* followed by mustard, were grown in soil to which ether was added and in the same soil without ether, showed that the yield of the wheat and the nitrogen assimilated were doubled under the influence of ether, whilst the second crop (mustard) was somewhat less than in the check pots.

Small amounts of ether have a retarding action on *Barbarea*, followed by a slight increase. The conclusion is drawn that the increased yields obtained after the application of ether or carbon disulphide cannot be due to increased nitrification or diminished denitrification, but to stimulation of the higher plants.

The results of fermentation experiments showed that small amounts of ether increase the activity of yeast. Carbon disulphide gave negative results (compare Goemer, *Koch's Jahresber.*, 2, 169).

N. H. J. M.

The Wandering of Betaine in Certain Vegetative Processes in Plants. VLADIMIR STANEK (*Zeitsch. physiol. Chem.*, 1911, 75, 262—271).—The dry residue of young leaves contains more betaine and more total nitrogen than old leaves. In the ripening of plant organs, betaine diffuses simultaneously with other nitrogenous substances. It is probably not a katabolic product, and trimethylamine is never found.

Betaine is formed during germination of the seed, and it is difficult to say whether it originates from reserve materials or in assimilated nitrogenous substances. During sprouting the betaine collects in the leaves, but it plays no part in the action of light on etiolated leaves, nor in the assimilation of carbon.

W. D. R.

Enzymic Degradation of Arginine in Plants. ALEXANDER KIESEL (*Zeitsch. physiol. Chem.*, 1911, 75, 169—196).—Arginine may be decomposed by ferments into ornithine and carbamide, or oxidised to give γ -guanidinobutyric acid, or with the loss of carbon dioxide to agmatine, $\text{NH}_2\cdot\text{C}(\text{NH})\cdot\text{NH}\cdot[\text{CH}_2]_4\cdot\text{NH}_2$. Each of these products may conceivably undergo further decomposition.

An attempt has been made to establish the manner of the decomposition of arginine in plants; it is proved that the change, although not quantitative, consists for the great part in the conversion into ornithine and urea. The formation of neither agmatine nor guanidine could be detected. The absence of guanidine is not due to any possibility of its removal by secondary changes; this point is still being investigated in the case of agmatine. Agmatine could not be obtained on hydrolysis of wheat embryos or by the autolysis of yeast.

The fact that ornithine has not yet been found in plants is not due to its removal by further change, but probably to the inadequate methods of isolation and identification when it is present in an impure condition. The formation of putrescine as a decomposition product of ornithine could not be detected. Plants contain a ferment (urease)

which decomposes carbamide as rapidly as it is formed, so that carbamide can only be found in those plants which lack this enzyme. Wheat embryos contain a very active urease. Urease is very specific in its action, and does not act synthetically. E. F. A.

Formation of Anthocyanic Pigments. RAOUL COMRES (*Compt. rend.*, 1911, 153, 886—889).—A preliminary note recording the isolation from autumnal leaves of *Ampelopsis heterocarpa* of a pigment crystallising in clusters of purple needles. The substance is very soluble in alcohol, sparingly so in water, ether, and benzene, and forms a green compound with lead acetate. Green leaves of the same plant yielded a substance crystallising in brown needles, and forming a yellow compound with lead acetate. The red colour of the autumn leaves is probably due to the first-mentioned pigment, which is related to the second in the manner suggested in an earlier paper (*Abstr.*, 1909, ii, 426). W. O. W.

Manganese in *Digitalis purpurea*. JAMES BURMANN (*Bull. Soc. chim.*, 1911, [iv], 9, 957—959).—*Digitalis ambigua* and *D. lutea* are indigenous to Switzerland, whilst *D. purpurea* can only be grown in gardens and does not reproduce itself. This seems to be due to the fact that the two former do not require manganese, whilst the third species does. *Digitalis* leaves grown on soil derived from ferruginous grit in Alluace gave 5.08% of ash, containing 9.02% manganese and 0.80% iron, whilst the grit itself contained 0.43% manganese and 4.82% iron. The presence of manganese in the ash serves to distinguish *D. purpurea* from *D. ambigua* and *D. lutea*. T. A. H.

Green and Yellow Dyes of Florideae. LEON MARCHLEWSKI (*Zeitsch. physiol. Chem.*, 1911, 75, 272. Compare Kylin, this vol., ii, 1024).—Kylin was unable to isolate chlorophyllanic acid and alloxanthophyllanic acid from his material; these substances are best identified by conversion into phyllocyanin and phylloxanthin. E. F. A.

Hydnocarpus Fats. K. LENDRICH, E. KOCH, and L. SCHWARZ (*Zeitsch. Nahr. Genussm.*, 1911, 22, 441—458. Compare Power and Gornall, *Proc.*, 1904, 20, 137; *Trans.*, 1904, 85, 838, 851; Power and Harrowcliff, *Trans.*, 1905, 87, 884, 896).—Margarine made with a so-called "cardamom oil" from India having caused several cases of illness, the margarine and the "cardamom oil" have been examined chemically and physiologically with the view of identifying the botanical source of the oil and to ascertaining the cause of its toxicity. The oil is probably derived from the seeds of either *Hydnocarpus Wightiana* or *H. venenata*, and owes its physiological action to the presence of chaetmogric and hydnocarpic acids (compare Litterscheid, *Chem. Zeit.*, 1911, 35, 9; Reinsch, *Chem. Zeit.*, 1911, 35, 77; Thoms and Müller, *Zeitsch. Nahr. Genussm.*, 1911, 21, 226; Plücker, *ibid.*, 1911, 21, 257).

The "cardamom" oil had D 0.9549—0.9560, m. p. 23.3—23.8°.

acid number 9.3—20.5, saponification number 202.6—265.5, iodine number 92.4—96.9, $[\alpha]_D^{25} + 54.67^\circ$ in 50% or $+ 55.02^\circ$ in 1% benzene solution. *Hydnocarpus Wightiana* fat had acid number 12.0, saponification number 203.9, iodine number 100.7, $[\alpha]_D^{25} + 55.6^\circ$. *H. teresensis* fat had acid number 44.0, saponification number 202.4, iodine number 97.0, $[\alpha]_D^{25} + 55.9^\circ$. *H. inebrians* fat had saponification number 211.2, iodine number 80.9, $[\alpha]_D^{25} + 42.3^\circ$. *H. anthelmintica* fat had acid number 12.0, saponification number 209.8, iodine number 84.5, $[\alpha]_D^{25} + 51.5^\circ$. *Taraktozenos Kurzii* fat had saponification number 209.7, iodine number 89.1, $[\alpha]_D^{25} + 47.7^\circ$ (compare Power and Collip, *loc. cit.*). The "cardamom" oil furnished chaulmoogric and hydnocarpic acids identical with those isolated by Power, Gornall, and Barrowcliff from the fats of *Taraktozenos Kurzii* and *Hydnocarpus anthelmintica* (Trans., 1904, 85, 838; 1905, 87, 884), but, unlike these fats, it did not contain palmitic acid, in which respect it resembles the *H. Wightiana* fat examined by Power and Barrowcliff (*loc. cit.*, p. 884). The "cardamom" oil produced nausea and sickness in dogs, as did also the chaulmoogric, hydnocarpic and liquid fatty acids isolated from it. The oxidised or brominated total fatty acids of the oil, however, proved to be physiologically inactive. All the *Hydnocarpus* fats and the *Taraktozenos Kurzii* fats also produced sickness in dogs. The toxic symptoms observed in all cases were vomiting and irritation of the mucous membrane of the stomach, with in some cases convulsions of the whole body. This physiological action appears to be correlated with the presence of an ethylene linking in the optically active acids of this group of fats, since the oxidised or brominated acids are inactive.

Hydnocarpus alpina fat had acid number 5.6, saponification number 209.06, iodine number 84.5, $[\alpha]_D^{25} + 49.0^\circ$, and is probably quite similar to the other fats of this genus examined (compare Grimme, *Chem. Ber. Fett. u. Harz.*, 1911, 18, Part 7). T. A. H.

Shea Butter. ALEXANDRE HÉBERT (*Bull. Soc. chim.*, 1911, liv., p. 959—963. Compare Southcombe, *Abstr.*, 1909, ii, 604).—Shea butter (Fr. karité butter) yields 96% of total fatty acids, m. p. 51°, containing 33% of oleic acid and 67% of saturated acids composed of arachidic, stearic, and palmitic acids. There is no material difference in the yield or characters of the fats derived from sun- or kiln-dried kernels (compare *Bull. Imp. Inst.*, 1908, 8, 369). T. A. H.

Experimental Chlorosis of Maize. PIERRE MAZÉ (*Compt. rend.*, 1911, 153, 902—905).—Maize grown in nutrient solutions free from iron or sulphur develops a very thin, almost transparent parenchyma, and the leaves do not become green. Deprivation of chlorine, magnesium, or silicon does not have this effect. That iron and sulphur are assimilated and fixed by the cells is shown by the fact that leaves etiolated in iron- or sulphur-free solutions are turned green by drops of ammonium sulphate or ferric nitrate respectively, but only in the immediate neighbourhood of the drops. W. O. W.

The Carbohydrates of the Foliage Leaf of the Snowdrop (*Galanthus nivalis*) and their Bearing on the First Sugar of Photosynthesis. JOHN PARKIN (*Bio. Chem. J.*, 1911, 6, 1—47).—The total carbohydrates in the leaf amount to 20—30% of the dry weight. Starch and maltose are absent; sucrose, dextrose, and levulose are present. The variations described in the relative amount of the three sugars occur in relation to time of day and season of the year, but the main fluctuation is in the sucrose. If the leaves are largely depleted of their sugars by darkness, the hexoses are not increased by exposure to sunlight, the augmentation being almost solely in the sucrose. The last-named sugar is regarded as the first sugar to appear, the others being derived from it by inversion; the levulose is always in excess of the dextrose, because the latter is more immediately utilised by the leaf. This view that the first sugar to arise in photosynthesis is sucrose was first advanced by Brown and Morris, but raises a difficulty, which is discussed in full, if the current formaldehyde theory is correct. W. D. H.

The Cyanogen Compounds of Tobacco Smoke. JULIUS TÖRN (*Chem. Zeit.*, 1911, 35, 1262. Compare this vol., ii, 143).—In reply to private enquiries, the author states that having reconsidered the process given for the estimation of cyanogen compounds in tobacco smoke (*Abstr.*, 1910, ii, 443) he comes to the following conclusions: (1) The assumption that the conversion of cyanogen into ferrocyanide by means of potassium hydroxide and ferrous sulphate is a complete one is quite correct. (2) In consequence, it is quite certain that tobacco smoke contains more cyanogen compounds than hitherto supposed. L. DE K.

Effect of Chemical Reagents on the Respiration and Growth of Wheat Seedlings. H. S. BEND (*Biol. Zentr.*, 1911, 40, 716; from *Bot. Gaz.*, 1910, 49, 81; *Bot. Zentr.*, 1911, 204).—Small amounts of calcium and sodium phosphate increase, whilst potassium salts diminish, respiration; sodium nitrate generally increases respiration, but its effect varies.

Respiration is diminished by inorganic acids, whilst the effect of organic acids is variable. Pyrogallol and tannic acid increase respiration considerably. N. H. J. M.

The Disease Causing Bitterness in Wines in Connexion with the Acrylic Fermentation of Glycerol. E. VOISNET (*Compt. rend.*, 1911, 153, 898—900. Compare *Abstr.*, 1909, ii, 738, 909).—The presence of acetaldehyde in wines which have developed bitterness has been demonstrated previously, and its formation attributed to the dehydration of glycerol by a specific ferment. The bitter taste of such wines appears to be due to condensation products of acetaldehyde. These substances are of a resinous character, and are produced when a dilute solution of acetaldehyde is warmed with potassium hydrogen tartrate; the ferment producing the aldehyde is also capable of effecting resinification. These observations render

unnecessary Wortmann's theory that bitterness is caused by the action of oxydases on tannin and colouring matters.

W. G. W.

Effect of Soluble Salts on the Adsorption of Phosphates by Soils. HARRISON E. PATTEN (*J. Physical Chem.*, 1908, 12, 639—658. Compare Abstr., 1908, ii, 126).—The rate of extraction of phosphoric acid from superphosphated soils is increased by the presence of dissolved salts in the percolating water. The soils examined were quartz flour (83% silt, 17% clay), "Podunk" sandy loam, and "Elkton" clay. To each kilo. of soil 0.61 gram of calcium monophosphate, $\text{CaH}_2(\text{PO}_4)_2$, this being equivalent to 350 lb. per acre (depth not stated).

In the case of quartz flour the amount of phosphoric acid dissolved out by distilled water was large at first (93 parts per million) but rapidly diminished to a constant low value of about 6 parts per million. Substituting 0.05% sodium nitrate solution for the distilled water without interrupting the continuity of the percolation, the concentration of phosphoric acid immediately rose to 44 parts per million and remained constant. The rates of percolation of distilled water and sodium nitrate solution were approximately equal.

With the "Podunk" loam and "Elkton" clay such marked increases in the phosphoric acid concentration were not generally observed, since the rate of percolation of the salt solution was almost invariably higher than that of distilled water. Potassium carbonate solution produced a deflocculation of the loam, which became clogged and stopped the passage of the liquid.

The author draws the conclusion that higher concentrations of phosphate may be obtained when weak solutions of the salts ordinarily used as soil amendments (potassium chloride, sulphate, nitrate and carbonate, and sodium nitrate) are passed through the soil than can be obtained by the use of distilled water alone. The effect is mainly produced by the mutual interference of the adsorptions of added salt and superphosphate by the soil particles.

R. J. C.

[Amount of Nitrogen as Ammonia and as Nitrates in Rain-water Collected at Uithuizemeeden.] J. HUNIG and H. WELT (*Verslag. landbouwkund. onderzoek. Rijkslandbouwpromissat.* 1911, No. 10, 188—118).—Nitrogen in the forms of ammonia and nitrates was estimated in the rain-water collected at Uithuizemeeden, Groningen, from September, 1901, to August, 1910. The average amounts of rain and of nitrogen in the two forms were as follows:

Rainfall, inches.	Nitrogen per million		Nitrogen per acre (lb.)		Total.
	as ammonia.	as nitrates.	as ammonia.	as nitrates.	
26.20	0.724	0.237	4.301	1.407	5.708

N. H. J. M.

Analytical Chemistry.

The Sodium Phosphate Standards of Acidity. EDMUND B. R. FAIRBANKS (*Bio.-Chem. J.*, 1911, 6, 122—126).—The H^+ ion concentrations obtained by mixing sodium hydroxide and phosphoric acid in varying proportions are represented graphically. Most of the results have already been published (compare *Trans.*, 1911, 99, 1224). The effect of errors in determining the concentrations of the reagents, and the influence of carbon dioxide have been measured. The reproducibility of the monohydrogen phosphate (Na_2HPO_4) standard from crystalline salt was found to be accurate, provided the salt is recrystallised under definite conditions. (G. S.)

Rapid Electroanalysis with Stirring by Bubbling a Gas Through the Solution. FRANZ FISCHER, CARL THIELE, and EMIL STRECHER (*Zeitsch. Elektrochem.*, 1911, 17, 905—906).—Instead of using a mechanical stirrer, the same object is advantageously effected by bubbling hydrogen through the electrolyte. The electrolytic cell consists essentially of a wide cylindrical glass tube, in which the cathode is supported at some distance from the bottom. The hydrogen is introduced by means of a long glass tube ending in a bulb provided with a number of small holes; the tube is so placed that the bulb is near the bottom of the cell. The cell is loosely closed by means of a funnel placed in the neck. As the electrolysis is conveniently carried out at 60° , the vapour from the solution condenses on the inner wall of the cell, and washes down any electrolyte which may be carried up on the walls by the stream of gas. It is shown that the method gives accurate results. (G. S.)

Rapid Electroanalysis under Reduced Pressure. FRANZ FISCHER, CARL THIELE, and EMIL STRECHER (*Zeitsch. Elektrochem.*, 1911, 17, 906—908. Compare preceding abstract).—The stirring of the electrolyte may also be effected by carrying out the experiment under reduced pressure, the volume of the gas given off during the electrolysis being thereby greatly increased. The apparatus, which is described and figured, is similar to that discussed in the former paper, except that the cell is closed by a rubber cork through which the connexions pass, as well as a glass tube connected to an ordinary filter pump. (G. S.)

Physico-chemical Volumetric Analysis. III. Precipitation Followed by Alteration in Potential. PAUL DUROI and GORRIED VON WEISSE (*J. Chim. phys.*, 1911, 9, 578—607. Compare *Abstr.*, 1910, ii, 342).—The contact potential of a metallic electrode undergoes a sudden change at the moment the last traces of the most electropositive metal in the solution are removed by precipitation. In order to render this phenomenon available in volumetric analysis, a very small current is passed through the solution, using platinum

electrodes, and the potential between the rapidly rotating cathode and an auxiliary calomel electrode is continuously noted during the introduction of the precipitant from a burette.

When the burette readings are plotted against the voltage, the end point of the titration corresponds with a double inflexion on the curve. This inflexion point, even if well marked, may differ from the theoretical end point by as much as 10%.

Foreign substances in some cases, not only affect the absolute value of the voltages obtained, but may also displace the inflexion point. If the polarisation current is long continued, or of too high a density, an amount of metal is apparently electro-deposited out of all proportion to the electro-chemical equivalent. The errors are such as would arise through the absorption of the solution by the precipitate.

Precipitates arranged in order of increasing absorbing power are silver bromide, copper sulphide, zinc sulphide, silver iodide, silver ferrocyanide, copper ferrocyanide. The precipitation of the last-mentioned substance is the most susceptible to experimental conditions.

In each case the most favourable concentrations of solution and precipitant, and the minimum current density with which a sharp inflexion point is obtainable, must be predetermined, and the titration must be carried out as quickly as possible. R. J. C.

Physico-chemical Volumetric Analysis. V. Estimation and Separation of the Halogens. PAUL DUROIT and GUSTAVE VON WEISSE (*J. Chim. phys.*, 1911, 8, 630—640. Compare *Repts. Abstr.*, 1893, ii, 387).—The use of the electrometric method instead of an indicator in the estimation of halogens has the advantage that very dilute solutions can be titrated accurately. Using silver nitrate as precipitant, 15 mg. of chloride can be estimated in a litre, and even bromide and iodide yet smaller quantities.

The alteration of potential on removing silver iodide is greater than occurs with the more soluble bromide or chloride. Iodide may be estimated in presence of an enormous excess of chloride or bromide provided that the solution is vigorously stirred to prevent premature precipitation of chloride or bromide. Chloride cannot be distinguished from bromide, as there is no marked potential change at the end of the precipitation of the bromide.

The method has been applied to the estimation of traces of chloride in potassium chlorate, and the estimation of iodine in urine. In the latter case very small quantities of iodide cannot be detected, being masked by the colloidal substances present. R. J. C.

Use of Carbon Disulphide for the Direct Estimation of Free Sulphur in Minerals. NATHAN LÉVY-W. (*Bull. Assoc. chim. ind. dist.*, 1911, 29, [iv], 218—220).—The author uses carbon disulphide for the assay of sulphur deposits containing mineral matter (sulf). The difficulty is, however, to evaporate the solvent completely without violent spitting towards the end of the operation; spontaneous evaporation is very tedious, and has other drawbacks. The author now operates as follows: The carbon disulphide containing the sulphur

from one gram of the sample is filtered into a long tube containing a little water, and, of course, collects at the bottom. The tube is now placed, in an inclined position, in a water-bath, and the carbon disulphide is completely distilled off. The vapours pass through a long, doubly bent tube, which dips into a vessel containing water, where the carbon disulphide is recovered. A small bulb with which the tube is furnished prevents regurgitation.

The sulphur is now transferred to a weighed filter, which is then washed, dried, and re-weighed.

L. DE K.

The Volumetric Estimation of Sulphur in Iron and Steel.

T. GIFFORD ELLIOT (*J. Iron Steel Inst.*, 1911, 83, 412-420).—Many specimens of iron and steel do not evolve the whole of their sulphur when treated with concentrated hydrochloric acid after annealing in hydrogen. Better results are obtained by the following method, which is applicable to all varieties of iron and steel, except those containing titanium. Five grams of the drillings are mixed with 0.25 gram of dry, powdered potassium ferrocyanide, wrapped in a 11 cm. filter paper of a grey iron, or in two such papers if a white iron or steel, and annealed for twenty minutes at 750-850° in a porcelain crucible. The mass, enclosed in the charred paper, is broken up and introduced into the evolution flask, covered with 50 c.c. of hydrochloric acid, 0.1 N, and heated. The absorbing solution is made by dissolving 20 grams of cadmium chloride in water with a few drops of hydrochloric acid, adding ammonia until the precipitate completely dissolves, and acidifying with acetic acid, then adding a further 20 c.c. of acetic acid, and making up to 2 litres. Sixty c.c. of this solution are used for each estimation. When no more gas is evolved, an excess of iodine solution is added to the absorbing vessel, followed by hydrochloric acid until the cadmium sulphide is dissolved. The iodine is then titrated with sodium thiosulphate.

C. H. D.

Detection of Nitrogen in Organic Substances. A. HALENKE and M. KLING (*Chem. Zeit.*, 1911, 35, 1180).—The substance to be tested is mixed with potassium hydroxide and placed in a test-tube. To the mouth of the tube is attached a Fresenius filter-tube, the bulb of which is filled with glass beads, placed over a pad of glass wool. A strip of moist red litmus paper is suspended from a hook in the upper part of the filter-tube, and the whole is connected with a vacuum pump. The test-tube is then heated slowly until the potassium hydroxide fuses. Any potassium hydroxide sprayed up is retained by the beads; therefore, if the evolved vapours turn the paper blue, ammonia must be present.

L. DE K.

Decomposition of Uric Acid by means of Dilute Sodium Hydroxide Solutions. CLARENCE E. MAY (*J. Amer. Chem. Soc.*, 1911, 33, 1783-1787).—In view of Steel's modification of Folin's method for the estimation of ammonia in urine (this vol., ii, 68), in which a large excess of sodium chloride is employed in order to prevent the decomposition of carbanide and uric acid, a study has been made of the action of dilute sodium hydroxide on solutions of uric

acid. The results show that a small, but constant, quantity of ammonia is produced, but that the presence of sodium chloride has very little effect. It is possible that other nitrogenous constituents of milk may be protected by sodium chloride, but the use of such large quantities as recommended by Steel (*loc. cit.*) does not seem to be justified.

E. J.

Estimation of Nitric Acid in Milk by means of Diphenylamine-Sulphuric Acid. J. TILLMANS and A. SPLITTGERBER (*Zeitsch. Nahr. Genussm.*, 1911, 22, 401—404).—In estimating nitric acid (nitrates) in milk by the process described previously (*this vol.*, ii, 151), it is recommended that the milk be treated with the same volume of a mixture consisting of equal parts of 5% mercuric chloride solution and 2% hydrochloric acid. After filtration, 1 c.c. of the serum is mixed with 4 c.c. of the diphenylamine-sulphuric acid reagent, and the coloration produced compared with those obtained with solutions containing known quantities of nitric acid. As milk contains certain substances which prevent the full development of the coloration due to the nitric acid present, these standard solutions should be prepared by placing quantities of 0.45, 0.85, 1.2, 1.5, and 2.0 c.c. of a 0.01% potassium nitrate solution in separate 100 c.c. flasks, adding 2 c.c. of saturated sodium chloride to each, and diluting to 100 c.c.; these solutions will then contain quantities corresponding with 1, 2, 3, 4, and 5 mg. of nitric acid (N_2O_5) respectively per litre of milk.

W. P. S.

The Accuracy of Nitrate Estimations. SIEGFRIED SEYDEL and L. WICHERS (*Zeitsch. angew. Chem.*, 1911, 43, 2046—2054).—A criticism of the various methods for the estimation of nitric nitrogen now in vogue, particularly in their application to soil analysis.

Reduction in alkaline solution by means of zinc and iron gives good results if the amount of nitric nitrogen actually present does not exceed 30 mg. Denesch's objection that ammonia is split off from nitrogenous organic matters present, and so affects the result, was found to be groundless. With great care, and making a check experiment side by side, Schloesing's process (measuring as nitric oxide) also gives good results in presence of organic matters (urea excepted). The results obtained by the "nitron" process are a little too low, but this method may be used even in the presence of urea and asparagine. Ulsch's process (reduction with iron in acid solution) is, according to Denesch, liable to give excessive results in the presence of much organic matters; the author's confirm that statement.

Denesch's indirect process cannot be recommended.

L. DE K.

Analysis of Nitrates. ANTONIO QUARTAROLI (*Gazzetta*, 1911, 41, ii, 53—59).—See this vol., ii, 1085.

Estimation of Phosphorus in Pig Iron and Cast Iron without Separation of Silicon. EUGEN R. E. MÖLLER (*Chem. Zeit.*, 1911, 35, 1201—1202).—Four grams of the sample are placed in an Erlenmeyer flask, and boiled with 60 c.c. of nitric acid (D 1.2). When all dissolved

the liquid (which should not occupy less than 30 c.c.) is transferred to a 100 c.c. flask and made up to the mark. Twenty-five c.c. are then taken and boiled in a beaker with 2 c.c. of potassium permanganate (40 grains per litre) for two minutes, and, after cooling the beaker for ten minutes in a stream of cold water, the excess of the permanganate, together with any manganese peroxide formed, is decomposed by careful addition of sodium peroxide in small portions at the time.

The clear solution is now again heated to boiling, and then mixed with its own volume of molybdenum solution. A pure yellow precipitate is obtained, fit for direct weighing, after drying at 150°. Contrivances for cooling and filtering are described and figured in the original.

L. DE K.

Mechanicalising Analysis as an Aid to Accuracy and Speed. CHARLES H. RIDSDALE AND N. D. RIDSDALE (*J. Iron Steel Inst.*, 1911, 83, 332—374).—The rapid methods of estimating phosphorus and manganese in steel, iron, or slag have been modified by employing the oxidising and other reagents in the form of compressed solid tablets or "analoids," thus saving weighing and ensuring the uniformity of the conditions of oxidation and precipitation. C. H. D.

Estimation of Hypophosphites. ERWIN RUPP AND KROLL (*Arch. Pharm.*, 1911, 249, 493—497).—Rupp and Finck have described (*Abstr.*, 1903, ii, 330) a process for the estimation of hypophosphites, which depends on their oxidation to phosphites and eventually to phosphates by the action of iodine. The first step in this reaction is slow, and the whole estimation occupies about twenty hours.

The authors now find that the oxidation may be accomplished much more speedily by using the standard bromine solution devised by Beckurts and Koppeschaar, which is formed by adding dilute sulphuric acid to a solution of potassium bromate and bromide of known strength. The amount of bromine solution used must be about twice that required to oxidise the hypophosphite to phosphate, and the reaction requires one hour for completion. The excess of bromine is determined by adding standard potassium iodide solution, and titrating the liberated iodine with standard thiosulphate.

T. A. H.

Method for the Detection and Estimation of Arsenic in Organic Compounds. GIUSEPPE BHESSANIN (*Boll. Chim. Farm.*, 1911, 50, 727—730).—The arsenic in sodium cacodylate, sodium methylarsinate (arrhenal), sodium *p*-aminophenylarsinate (atoxyl), and dihydroxydiaminoarsenobenzene dihydrochloride (salvarsan) can be estimated by the author's method for arsenic in inorganic compounds, which depends on the insolubility of arsenic iodide in sulphuric acid or hydrochloric acid. In these cases, however, the substances must first be heated for about two hours with concentrated sulphuric acid in order to remove the arsenic from organic combination.

An account is also given of the behaviour of "salvarsan" towards a number of reagents.

R. V. S.

Detection, Separation, and Estimation of Arsenic and Antimony. GIUSEPPE BRASSAUR (*Bull. Chim. Farm.*, 1904, 52, 691—694).—The method of estimating arsenic given by Blattner and Brasseur (*Abstr.*, 1904, ii, 291) gives good results when applied to sulphuric acid of 45° Baumé, and also with mixtures of sulphuric and hydrochloric acids, provided that the amount of the latter is not more than one-third of that of the former; if this proportion is exceeded, loss occurs owing to partial solution of the arsenic triiodide by the hydrochloric acid, washing off the precipitate with the latter and causing further loss. Instead of 5 c.c. of 30% potassium iodide solution, only 2.5 c.c., or even less, should be used for the precipitation. Hence for estimating arsenic in hydrochloric acid, 1 part of the acid mixed with 2 parts of pure sulphuric acid of 45° Baumé, or of sulphuric acid free from tin and lead, the precipitation is effected without addition of hydrochloric acid, whilst with commercial sulphuric acid (45° Baumé) one-third of its volume of hydrochloric acid is added; if nitrous compounds are present, these must be decomposed by adding a sufficient quantity of urea crystals. For washing the precipitate a mixture of 2 parts of sulphuric acid (45° Baumé) and 1 part of hydrochloric acid is employed. The above procedure gives results which are much nearer to the truth than Blattner and Brasseur's method, and are not vitiated if the sulphuric acid has a density as high as 50° Baumé.

The estimation of antimony in sulphuric acid can be carried out in a similar manner, but the antimony iodide is soluble in hydrochloric acid. The most suitable density of the sulphuric acid for the complete precipitation of antimony iodide is 50° Baumé, and the precipitate is freed from the iodine which separates by three washings with sulphuric acid (50° Bé.). The antimony iodide is dissolved in 10% Rochelle salt solution prior to titration.

Arsenic and antimony may be estimated simultaneously by dissolving the substance in, and making up to a known volume with, sulphuric acid of 50° Baumé. In an aliquot part of the solution, the two iodides are precipitated, and the precipitate dissolved and titrated with sodium solution as above. Another aliquot portion is mixed with one-third of its volume of hydrochloric acid, this solution yielding only arsenic tri-iodide on precipitation.

The same method is applicable to the estimation of arsenic or antimony in arsenates or antimonates. T. H. P.

Spectrophotometric Estimation of Xenon. Constancy of the Xenon-Argon and Xenon-Krypton Ratios in Natural Gaseous Mixtures. CHARLES MOUREU and ADOLPHE LEPAPE (*Compt. rend.*, 1911, 153, 740—743. Compare *Abstr.*, 1909, ii, 363; 1910, ii, 156; this vol., ii, 392, 439, 808).—The amount of xenon in mixtures of the gas with argon can be determined by a method identical in principle with that already described for krypton, the line $\lambda 4671.42$ being employed for the purpose. In this way it is possible to estimate 0.0005 cm. of the gas in 4 c.c. of a mixture. The ratio of xenon to krypton was found to be fairly constant in seventeen natural gases from thermal springs and in one from a volcano. Taking this in conjunc-

those with the results already recorded for argon, it is shown that the constant proportions in which these gases occur resemble that of the components of a definite compound, a conclusion in harmony with the nebular hypothesis of the origin of the solar system. W. O. W.

Potassium: its Titrimetric Estimation in Small Amounts.

LESLIE T. BOWSER (*J. Amer. Chem. Soc.*, 1911, 33, 1752-1757).—The author has recently described a method for the detection of small quantities of potassium as the cobaltinitrite (this vol., ii, 1031). A process for the estimation of potassium has now been devised in which the metal is precipitated as dipotassium sodium cobaltinitrite, and the latter is collected and titrated with dilute potassium permanganate.

The solution in which potassium is to be estimated is evaporated nearly to dryness, and, when cold, is treated with 2.5 c.c. of sodium cobaltinitrite solution and 10 c.c. of a mixture of equal volumes of glacial acetic acid and 95% alcohol. The precipitate is collected on an asbestos filter, and washed with 20% acetic acid. The asbestos pad and precipitate are transferred to a beaker, and an excess of 0.005*N.* potassium permanganate solution is added from a burette. The mixture is boiled, acidified with sulphuric acid, and, after continuing the boiling for a moment, the excess of potassium permanganate is titrated back by means of 0.005*N.* oxalic acid. After making the necessary deduction indicated by a blank experiment, the number of c.c. of permanganate used when multiplied by 0.00004282 gives grams of K_2O , or by 0.00003554 gives grams of K .

The estimation is not affected by the presence of moderate quantities of sodium, calcium, or magnesium. The method is recommended as being simple and trustworthy for small amounts of potassium (about 50 parts per million), but cannot be used for the estimation of large quantities. E. G.

Estimation of Potassium in Urine. HARRY H. GREEN

(*Ind. Chem. J.*, 1911, 6, 69-75).—The volumetric method of estimating potassium as the cobaltinitrite, described by Drushel (*Abstr.*, 1905, ii, 66), has been modified for the estimation of potassium in urine compare also Drushel, *Abstr.*, 1909, ii, 94). Twenty-five c.c. of urine are evaporated to dryness and ignited; the ash is moistened with nitric acid, and again ignited until free from organic matter and ammonium salts. It is then dissolved in water containing a little hydrochloric acid, neutralised with sodium hydroxide containing a little sodium acetate, the solution evaporated to 5-10 c.c., 1 c.c. of glacial acetic acid and 10 c.c. of the cobalt reagent, prepared as described by Adie and Wood (*Trans.*, 1900, 77, 1076) added, and then evaporated to crystallisation. The cobaltinitrite, $K_2NaCo(NO_2)_6 \cdot 11H_2O$, is freed from the brown matrix by treatment with about 50 c.c. of 10% acetic acid, washed with dilute acetic acid, dried, and then oxidised with potassium permanganate as described by Drushel (*loc. cit.*). Potassium can be estimated with equal accuracy as chloride, sulphate, nitrate, and acetate by this method, provided no free acid other than acetic is present during evaporation with the sodium cobaltinitrite reagent.

Salts of other metals have very little effect on the accuracy of the method.

The Electrolysis of Sodium Chloride with the Mercury Cathode. CHARLES A. PATZES (*Amer. J. Sci.*, 1911, **34**, 365—385).—The author shows that in the electrolysis of sodium chloride in the Hildebrand apparatus for the electrolytic determination of anions (Abstr., 1907, ii, 574), the anode being of silver and silver-plated platinum, and the cathode of mercury, silver is always transferred from the anode to the cathode. Under certain conditions, which must be determined by experiment for each apparatus and strength of solution used, the amount of silver thus transferred may be neglected for analytical purposes.

It is recommended that the anode covered with silver chloride be first heated below the fusing point of the chloride to decompose the silver oxide, and that then the heat be increased so as to fuse the chloride, five or ten minutes at 400—500° being sufficient.

Sodium hydroxide is always present in the inner cell after the beginning of the electrolysis, a low current with corresponding increase in time of electrolysis producing more alkali than a high current in a short time of electrolysis.

The best method for removing the fused chloride from an anode is to heat it for about twenty minutes at 500° in a current of hydrogen.

T. S. P.

Use of the Edison Accumulator in Electro-analysis. OTTO BRUNCK (*Zeitsch. angew. Chem.*, 1911, **24**, 1993—1997).—The author uses the Edison accumulator for the estimation and separation of metals which can be deposited from sulphuric acid solution with less than 1.36 volts; such metals are silver, mercury, palladium, platinum, rhodium, iridium, etc. The accumulator is connected directly with the electrolytic apparatus, a rheostat in the circuit not being necessary (compare Foerster, Abstr., 1906, ii, 805), unless the current density exceeds 0.2 ampere per sq. dcm. A gauze cathode of 50 sq. cm. area is used.

Silver is best deposited from a sulphuric acid solution at a temperature of 80—90°, at which temperature the solubility of silver sulphate is sufficient to retain it in solution; any nitric acid present is previously expelled by evaporation with sulphuric acid. The results are quantitative in the presence of copper, arsenic, antimony, or lead. In the presence of antimony some tartaric acid must be added before the electrolysis is proceeded with, and it is not necessary to filter off any lead sulphate before depositing the silver.

The author has also used a Leclanché dry cell in place of the Edison accumulator, care being taken not to let the current density exceed 0.2 ampere per sq. dcm.; it could be used for two years without renewal, since during any electrolysis with graded potential the current gradually falls to zero.

T. S. P.

Estimation of Calcium in the Presence of Magnesium and Phosphates. Estimation of Calcium in Urine. FRANCIS H. MCCRUDDEN (*J. Biol. Chem.*, 1911, **10**, 187—199).—The method

described previously by the author (Abstr., 1910, ii, 243) may be rendered more rapid as follows: the neutralised urine is acidified with hydrochloric acid, oxalic acid and sodium acetate are added, and the mixture is shaken for ten minutes or placed aside overnight. The calcium oxalate is then collected, washed, and ignited, or titrated with permanganate solution.

W. P. S.

Physico-chemical Volumetric Analysis. IV. Estimation of Copper and Silver. PAUL DUTOIT and GOTTFRIED VON WEISSAK (*J. Chim. phys.*, 1911, 9, 608—629).—The precipitation of copper or silver by a soluble sulphide gives a more sharply defined potential change than when other precipitants, such as sodium hydroxide, potassium ferrocyanide, or sodium thiosulphate, are employed.

Potassium sulphide containing excess of potassium hydroxide, prepared in the laboratory, was used in most of the experiments, but was found to undergo slow conversion into thiosulphate with loss of precipitating power. Crystalline sodium sulphide was afterwards found to be more stable.

The precipitation of silver by alkali sulphide proceeds normally, but copper always requires 2—3% more sulphide than theory demands. The sulphide must, therefore, be standardised against solutions of the same metal at about the same concentration as it is to be employed with. The potassium sulphide must not be weaker than *N* 50, since more dilute solutions undergo decomposition to thiosulphate at a rapid rate. Hence in the titration of small quantities of copper or silver a microburette is used.

The solutions are neutralised and acidified with acetic acid before titration. Mineral acids in the solution give rise to serious errors. The current density of the polarising current must not exceed 10⁻⁴ amperes. With very dilute solutions, a correction may be applied for electro-deposited metal.

Copper and silver may be titrated accurately in solutions containing 20 mg. per litre, and even traces of the order 0.1 mg. per litre can be estimated, although no visible precipitate or coloration is present.

The estimation of copper is unaffected by relatively enormous proportions of neutral salts, so that the method may be found applicable in the examination of preserved foods.

R. J. C.

Quantitative Estimation of Copper in Commercial Sulphate by means of Alkali Hypophosphites. ALFREDO CAVAZZI (*Gazzetta*, 1911, 41, ii, 374—378).—The author calls attention to his publications on this subject (*Rend. R. Accad. Sci. Bologna*, 1900—1902). The solution of 2 grams of copper sulphate in about 25 c.c. of water is acidified with 12 drops of 5% sulphuric acid, 10 c.c. of 40% sodium hypophosphite are added, and the mixture is heated on the water-bath for twenty minutes. A 10% solution of sodium carbonate is then added, until no more carbon dioxide is evolved, care being taken that the hot liquid remains clear, and the heating is continued for ten minutes. While still hot, the liquid is again neutralised, the copper is collected, and weighed after ignition in a current of hydrogen. The

process is rapid and accurate, and is only interfered with (and then but slightly) by the presence of arsenic, which is infrequent.

R. V. L.

Precipitation of Zinc, Manganese, Cobalt, Nickel, Copper and Cadmium from their Ammoniacal Solution with Sodium Carbonate and Phenyltrimethylammonium Carbonate. E. SCHIRM (*Chem. Zeit.*, 1911, 35, 1177, 1193—1194).—The carbonates of the above metals to which has been added excess of ammonia (and in some cases, ammonium carbonate) do not deposit the hydroxides of these carbonates completely on boiling, but do so when a solution of sodium carbonate is added. On account of its complete volatility ammonium phenyltrimethylammonium carbonate may be used in preference to the sodium salt.

The carbonates separated are completely free from sulphuric acid. Sulphuric acid can, therefore, be entirely recovered from the filtrate. When dealing with manganese salts, a little hydrazine hydrochloride should be added to prevent turbidity when adding ammonium

L. E. K.

Iron Metabolism. I. The Estimation of Small Amounts of Iron. FRIEDRICH JAHN (*Zeitsch. physiol. Chem.*, 1911, 75, 308—338).—The author has endeavoured to find a suitable method for estimating small quantities of iron in organic substances. Neither the so-called wet incineration method (*Abstr.*, 1903, ii, 243; 1906, ii, 243) should be used, any iron in the acids used being estimated and allowed for. He finds that estimation by means of potassium permanganate, hydrochloric acid, or stannous chloride does not lead to exact results, and proposes a method of reducing the iron by means of a slight excess of stannous titanous chloride solution, and subsequent determination of this excess by means of standard iron solution, potassium thiocyanate being used as indicator.

The effect of varying the volume of solution, and the amounts of potassium thiocyanate, iron, sulphuric and hydrochloric acids have been studied.

H. W.

Quantitative Separation of Iron and Manganese. JESÚS A. SANCHEZ (*Bull. Soc. chim.*, 1911, [iv], 9, 880—881).—The process depends on the fact that from a solution containing ferric and manganous salts, pyridine precipitates the iron as ferric hydroxide, leaving manganous dissolved. By this means, 0.0005 gram of manganese may be estimated in presence of 1 gram of iron.

In the case of manganese minerals, 1 gram is dissolved in warm hydrochloric acid, and the silica rendered insoluble by evaporation to dryness twice. The filtrate is nearly neutralised by sodium hydroxide diluted to 100 c.c., pyridine added in excess, and the whole boiled during ten minutes. If manganese is present in large amount, the precipitated ferric hydroxide should be collected, washed, and re-treated.

In minerals containing metals of Group I, the latter should be removed by hydrogen sulphide, and the filtrate boiled and cooled before adding the pyridine. Zinc is also precipitated by pyridine.

though incompletely, and if this metal is present, the ferric hydroxide should be redissolved and reprecipitated by ammonia in presence of ammonium chloride.

T. A. H.

Estimation of Nickel [in German Silver]. FRED INBROSON (*Chem. News*, 1911, 104, 334).—0.5 Gram of the alloy is dissolved in 5 c.c. of nitric acid (D 1.2), and diluted to 400 c.c. 0.3 Gram of tartaric acid is added, and then ammonia in excess. After heating to boil, an excess of solution of dimethylglyoxime is added.

The precipitate containing the nickel is collected on a filter, and washed with a hot solution of ammonium nitrate until the washings are colourless. As it always retains copper, it must be re-dissolved in hot dilute nitric acid (1:1) and re-precipitated as directed.

The precipitate whilst still wet is enclosed completely in two filters, transferred to a crucible, and heated cautiously at the mouth of the fume or over a small flame until the outer papers are thoroughly charred. The temperature is then gradually increased to a bright red heat.

L. DE K.

Precipitation of Nickel Compounds and Preparation of Spongy Nickel. WILSON H. LOW (*Analyst*, 1911, 36, 533—540).—Nickel is not precipitated completely from its solutions either by ammonia or hydrazine on boiling, but if a solution of a nickel salt containing ammonium chloride is boiled with excess of hydrazine, the nickel is completely precipitated. When the precipitate is ignited in a current of hydrogen, spongy nickel is obtained, which, of course, is free from fixed alkali.

L. DE K.

Estimation of Tungsten in Wolframits in the Presence of Molybdenite. WOLDEMAR TRAUTMANN (*Zeitsch. angew. Chem.*, 1911, 24, 2142—2143).—One gram of the finely powdered ore is gently roasted in a platinum crucible until the odour of sulphur dioxide has gone off. The mass is then extracted three or four times with warm dilute ammonia, which dissolves the molybdenum trioxide formed. The filter, after being washed with solution of ammonium nitrate, is replaced in the crucible, and the whole is again ignited; the residue is then submitted to the ordinary fusion with sodium hydroxide, which should be done in a nickel crucible.

L. DE K.

Use of Hæmatin in Qualitative Analysis and in the Volumetric Estimation of Bismuth. ETTORE VASSALLO (*Gazzetta*, 1911, 41, ii, 204—212. Compare Moffatt and Spiro, *Abstr.*, 1907, ii, 653).—Solutions of hæmatin, obtained by extracting logwood with alcohol, give colorations with most metals and metalloids, but only a few of these persist in faintly acid solutions. Bismuth gives an intense violet coloration, even in fairly acid solution; arsenic, antimony, and tin also give a violet coloration. Solutions of molybdenum give an intense blue coloration, which is stable towards fairly concentrated acid. Schemes of analysis are given for recognising tin and bismuth in alloys and mixtures by the

use of hamatin test-papers. The sensibility, in presence of suitable concentrations of acid, exceeds one part in fifty thousand.

The volumetric estimation of bismuth is effected by adding a standard solution of disodium phosphate to the bismuth solution and testing the liquid for bismuth by means of the logwood test-papers at intervals. The results quoted show a positive error ranging from 0.9 to 0.1%, the variation being associated with different conditions of dilution and temperature. The best results are obtained when the solution is kept cold and also neutral.

R. V. S.

Colorimetric Detection of Alcohol in Presence of Acetone Colour Reactions of Certain Groups of Organic Compounds in Presence of Mineral Acids and Potassium Dichromate. HENRI AGULHON (*Bull. Soc. chim.*, 1911, [iv], 9, 881—885 (Comptes Rendus, 1898, ii, 543)).—The author finds that the reduction of potassium dichromate in presence of sulphuric acid by organic substances becomes more specific in character when nitric acid, phosphoric acid, or potassium hydrogen sulphate is substituted for sulphuric acid.

Potassium dichromate, 0.5 gram, dissolved in 100 c.c. of nitric acid (36°Bé) gives at once a bluish-violet coloration in the cold with substances containing a $-CHO$ or $-OH$ group, and with certain other compounds, such as ether, ethyl acetate, formic acid, and unsaturated fatty acids. The aliphatic ketones give a coloration, but as a rule only after some hours. Acetophenone and the quinones behave like acetone, but cyclohexanone and its homologues give the coloration immediately. Certain phenols give the same colour reactions as they do with potassium dichromate alone. The reaction is less specific on warming, and under these conditions a green coloration is developed.

With phosphoric acid (60°Bé) the range of applicability is the same as with nitric acid, but the reagent is then less delicate.

With potassium hydrogen sulphate in water no coloration is produced in the cold, but a green tint is produced on warming. This is given by alcohols, aldehydes, cyclohexanone, and its homologues, ether, ethyl acetate, etc., but not with aliphatic ketones, acetophenone, or unsaturated fatty acids. In this form the reagent may be used to distinguish ricinoleic acid, which contains an $-OH$ group, from oleic and other like acids which do not.

T. A. H.

Analysis of Lactic Acid. A. A. BESSON (*Chem. Zeit.*, 1911, 35, 1209—1210).—It is shown that the total acidity of lactic acid containing lactic anhydride may be accurately estimated by neutralising the free acid, adding an excess of $N/1$ -alkali, leaving the mixture at the ordinary temperature for ten minutes, neutralising the excess of alkali, adding a slight excess of $N/1$ -acid, boiling, and titrating the acid.

W. P. S.

Estimation of β -Hydroxybutyric Acid in Urine. ROBERT A. COOKE and E. E. GORSLIN (*J. Biol. Chem.*, 1911, 10, 291—294).—Results of experiments carried out by the authors show that the

method described by Shaffer (Abstr., 1908, ii, 292) is trustworthy, provided that the urine is treated with an excess of basic lead acetate and ammonia before the distillation part of the process is commenced. This treatment is especially necessary in the case of urines containing large quantities of dextrose. The excess of lead should be removed before the distillation, in order to prevent "bumping."

W. P. S.

Polarimetric Method for the Estimation of Malic Acid and its Application to Cane and Maple Products (Sugars).

PETER A. YODER (*Zeitsch. Nahr. Genussm.*, 1911, 22, 329-350).—The method depends on the increase in the rotatory power of malic acid when the acid is treated with uranium salts. A solution of malic acid containing 1 gram per 100 c.c., when converted into the uranium compound by the addition of uranium acetate in the proportion of at least 1.25 atoms of uranium to 1 molecule of malic acid, has a rotatory power of -29.7° Ventzke at 20°C . for white light, or -28.9° for sodium light. The presence of organic acids, with the exception of optically active hydroxydicarboxylic acids, does not, within certain limits, have any great influence, and sugars, such as sucrose, dextrose, and levulose, have no effect; mineral acids, however, seriously affect the rotatory power of the malic acid-uranium compound. The rotatory power decreases by 0.03° Ventzke for each 1° rise in temperature. In the case of a 1% solution of tartaric acid, the uranium compound has a rotatory value of $+26.1^\circ$ Ventzke. For the estimation of malic acid in sugar-cane and maple products, 50 grams of the syrup, or a mixture of 35.33 grams of sugar with 16.66 c.c. of water, are neutralised, diluted with water to a weight of 65 grams, and treated with 10 c.c. of lead acetate solution, D 1.25. After the addition of 150 c.c. of 95% alcohol, the mixture is set aside for three hours, then filtered, and the precipitate washed with 75% alcohol. The precipitate is treated with hydrogen sulphide, the lead sulphide is removed by filtration, the filtrate is evaporated to a volume of about 30 c.c., and then diluted to 50 c.c. The rotatory power of 20 c.c. of this solution is determined before and after the addition of uranium acetate, the mixture being neutralised in the latter case, and allowance made for the alteration in volume. The percentage quantity of malic acid, x , present, is calculated from the formulæ: for white light,

$$x = \frac{(P_1 - P) \times [1 + 0.001(t - 20)]}{-29.6 \times 0.5L}$$

or, for sodium light, $x = \frac{(P_1 - P) \times [1 + 0.001(t - 20)]}{-28.8 \times 0.5L}$, where P and P_1

are the rotatory powers before and after treatment with uranium acetate respectively, and L the length of the polarimeter tube in dm. Barium acetate may be employed in place of lead acetate in the process. Sugar-cane syrup was found to contain 0.02% of malic acid, and maple syrup from 0.26 to 0.51%. If the total acidity, n , expressed in c.c. of N 1-alkali be known, malic and tartaric acids may be estimated in mixtures of the same; let the increase in the rotatory power at 27.5° in a 20 cm. tube be m° Ventzke, x the percentage of malic acid, and y

the percentage of tartaric acid, then $n = \frac{x}{0.06703} + \frac{y}{0.06703}$
 $m = 25.16y - 29.27x$, or, $x = 0.03287n - 0.01741m$ and $y = 0.00924n + 0.01949m$.
 W. P. S.

Detection of Benzoic Acid in Foods. EDUARD HEIDE (Arbeit. Kaiserl. Gesundheitsamts, 1911, 38, 149—154; Reprint).

I. *Estimation of the Total Benzoic Acid in Cranberries, etc.*—The cranberries are heated with alcohol for one hour, the mixture is then treated with an excess of sodium hydroxide, filtered, the filtrate is evaporated to remove alcohol, and the residue is extracted with a mixture of ether and light petroleum, after being acidified with sulphuric acid. The ethereal extract is then shaken with dilute sodium hydroxide solution, and the alkaline aqueous extract containing the benzoic acid is treated with potassium permanganate as described by Heide and Jakob (Abstr., 1910, ii, 359). The benzoic acid is next extracted with ether, the ethereal solution is evaporated, the residue is re-dissolved in a small volume of ether, transferred to a test-tube, and after the ether has been evaporated, the benzoic acid is sublimed on to the upper sides of the tube. The lower portion of the tube is then cut off, and the benzoic acid is dissolved in alkali and titrated. The amount of benzoic acid found in various samples of cranberries varied from 0.089 to 0.206% (compare Abstr., 1910, ii, 440).

II. *Detection of Benzoic Acid in Wines.*—The method of separating benzoic acid from wine described by Heide and Jakob (*loc. cit.*) was found to be trustworthy; it is recommended, however, that the wine be filtered, after being evaporated in the presence of alkali and then acidified, previous to the extraction with ether. The benzoic acid obtained may be identified by fusing it for not longer than three minutes with potassium hydroxide, and testing the resulting solution with ferric chloride.
 W. P. S.

Detection of Benzoic Acid in Margarine, Butter, and Other Fats. WALTHER FRIESE (*Pharm. Zentr.-h.*, 1911, 52, 1201—1202). One hundred grams of the fat are mixed thoroughly with 25 c.c. of a 20% sodium carbonate solution, and the mixture is melted on a water bath. After cooling, the aqueous layer is separated, treated with an excess of 10% barium chloride solution, the barium precipitate is collected on a filter, and the excess of barium is removed from the filtrate by the addition of sulphuric acid. The benzoic acid is then extracted from the acid solution with ether, and the residue obtained on evaporating the ethereal solution is tested for benzoic acid, preferably by heating the residue with alcohol and sulphuric acid; any benzoic acid present is thus converted into ethyl benzoate, which may be identified by its odour.
 W. P. S.

Kobert's Reagent as a Test for Salicylic Acid. JOHN McCARTHY (*Analyst*, 1911, 36, 540—541).—Kobert's morphine reagent (sulphuric acid containing one drop of formaldehyde solution per c.c.) gives a characteristic rose colour with salicylic acid or salicylates. The reaction is

is clearly seen when about 1/50 mg. is dissolved in two drops of sulphuric acid and a drop of the reagent then added. The test also works with *o*-acetoxybenzoic acid (aspirin) and salol.

Sodium gives a red colour with sulphuric acid alone, but if to the solution is added a drop of the reagent in such a way that mixing does not occur, a much deeper and richer red is developed.

Robert's reagent also gives characteristic colorations with the following substances: Phenol, reddish-violet; catechol, violet (redder than the colour obtained with morphine); resorcinol, deep orange-brown; quinol, dirty greenish-brown; pyrogallol, brown; α -naphthol, dirty green; β -naphthol, dirty brown; cinnamic acid, brown; mandelic acid, yellow.

L. NK K.

The Purification and Analytical Control of Potassium Ferrocyanide. KARL SCHROEDER (*Zeitsch. anorg. Chem.*, 1911, 72, 59-59). Compare Muller and Diefenthaler, *Abstr.*, 1910, ii, 910).—Potassium ferrocyanide has the composition $K_4Fe(CN)_6 \cdot 3H_2O$ even when crystallised from boiling solution, but in drying it is necessary to expose as small a surface as possible, or oxidation and loss of water take place.

Iron is best estimated in potassium ferrocyanide by heating with concentrated sulphuric acid, finally raising the temperature to the boiling point of the acid, dissolving in water and hydrochloric acid, and precipitating with cupferron (ammonium nitrosophenylhydroxylamine), igniting in a quartz crucible. The precipitate is free from alkali.

For the standardisation of permanganate solutions, the solution of potassium ferrocyanide (2 grams) is added to 100 c.c. of a cold saturated solution of mercuric chloride, and the precipitate obtained is then dissolved in 200 c.c. of the same solution, acidified with hydrochloric acid, and heated to boiling. After cooling, 30 c.c. of a solution prepared from 100 grams of manganous sulphate, 200 c.c. of concentrated sulphuric acid, and 200 c.c. of phosphoric acid, D 1.7, to the litre, are added. The values obtained on titrating with permanganate are slightly high, averaging 100.12%. (C. H. D.)

Apparatus for the Estimation of Amino-groups. DAVID KLEIN (*J. Biol. Chem.*, 1911, 10, 287-289). An apparatus is described for use in the estimation of aliphatic amino groups by the process proposed by van Slyke (this vol., ii, 944). W. P. S.

Estimation of Nicotine in Tobacco Extracts. W. KORNIG (*Chem. Zeit.*, 1911, 35, 1047-1048).—A reply to Töth (this vol., ii, 943), who complains that the solutions of nicotine in toluene obtained in the author's extraction process cannot be examined polarimetrically on account of their dark colour. The author states he has never experienced any trouble in that respect with the various polariscopes.

Xylene is also a very good solvent for nicotine. The specific rotation of nicotine in a dilute xylene solution is +173°. Other

objections to the process are also overruled, but it must be understood that the method applies to extracts only and not to tobacco.

L. I. K.

Estimation of Codeine in Opium. ALBERT E. ARNOLD (*Analyst*, 1911, 36, 489—490).—In the process described, the opium is extracted thoroughly with cold water, and the solution is treated with lead acetate to remove colouring matters, etc., and barium chloride. Sodium salicylate is then added in order to precipitate thebaine and any remaining resinous substances, and the filtered liquid is concentrated and shaken with ether to remove substances which are soluble in this solvent. The morphine is then "fixed" by the addition of a large excess of sodium hydroxide, and the solution is extracted with ether. The ethereal solution of the alkaloid is evaporated at a low temperature, the residue is dried under reduced pressure, and weighed. The dry alkaloid may also be titrated with *N/10*-acid, using litmus as the indicator.

W. P. S.

A Reaction of Sparteine. ARMAND JORRISSEN (*J. Pharm. Chim.*, 1911, [vii], 4, 251—252).—A reaction which distinguishes sparteine from other alkaloids consists in adding a small quantity of sulphur to an ethereal solution of the alkaloid, and treating the mixture with hydrogen sulphide. A bright red, bulky, precipitate is formed, which disappears on the addition of water. The precipitate is readily distinguished from those given by coniine and atropine under similar conditions; the former yields an orange-coloured precipitate and the latter a yellow precipitate.

W. P. S.

A Modification of Nakajama's Reaction for Bile Pigment in Urine. A. A. VON MASLOFF (*Zeitsch. physiol. Chem.*, 1911, 74, 297—298).—The reaction is intensified by the addition of a few drops of hydrogen peroxide.

W. D. H.

Estimations of Globulin by means of Ammonium Sulphate and the Preparation of Pure Globulins. HUGO WIENER (*Zeitsch. physiol. Chem.*, 1911, 74, 29—66).—The usual methods of fractionating serum proteins by ammonium sulphate are regarded as valueless, and give the amount of globulin too high. If the total protein is increased, the rise appears to fall on the globulin for this reason; hence clinical investigations of this nature need entire revision. The error is greatly minimised by diluting the serum first.

W. D. H.

Effect of Heat on the Peroxydase in Cow's Milk. J. J. VAN ECK (*Chem. Weekblad*, 1911, 8, 691—702; *Zeitsch. Nahr. Genussm.*, 1911, 22, 393—400).—The author describes an apparatus adapted for determining the diminution in the proportion of active peroxydase in milk caused by heating at different temperatures.

preparation of derivatives of $\beta\beta$ -dialkylpropionic acids, A., i, 259.

preparation of p -hydroxy- β -phenyl-ethylamines and its derivatives, A., i, 437.

preparation of nitrothioxanthones and their derivatives, A., i, 450.

preparation of diaminocarboxy diphenyl ethers, A., i, 456.

preparation of triphenylmethane derivatives, A., i, 458.

preparation of chloro-substitution products of anthraquinones and of halogenated anthraquinones, A., i, 466.

preparation of methoxyanthraquinones and their derivatives, A., i, 469.

the halogenation of indanthren, A., i, 504.

preparation of azines, A., i, 504.

preparation of tetramethylenediamine (α -diaminobutane), A., i, 526.

preparation of soluble compounds from hydroxymercuricarboxylic acids, A., i, 594.

preparation of olefine alcohols of the general formula $\text{OH}\cdot\text{CHMe}\cdot\text{CR}\cdot\text{CH}_2$, A., i, 598.

preparation of quaternary ammonium bases, A., i, 609.

preparation of hydroxyphenylethyl-dialkylamines, A., i, 629.

Farbenfabriken vorm. Friedrich Bayer & Co., preparation of hydroxyphenyl-ethylamines and their alkyl ethers, A., i, 629.

preparation of sulphaminobenzoyl-aminonaphthols and their sulphonic acids, A., i, 630.

preparation of phenyl esters of iodoparaffin acids, A., i, 630.

preparation of mixed formic acetic esters of alcohols, A., i, 659.

preparation of formyl derivatives of morphine alkaloids, A., i, 668.

preparation of esters of cinamic acid, A., i, 838.

preparation of α -hydroxy- β -phenyl-propionic acid alkyl ethers and their salts, A., i, 865.

[preparation of anthraquinones derivatives], A., i, 884, 1026.

[preparation of anthracene derivatives], A., i, 904.

[preparation of methylinanthren], A., i, 925.

preparation of iminoalkyl derivatives of azimino acid nitriles, A., i, 928.

the partial or total replacement of halogens by hydrogen in polyhalogenated anthracanthraquinones, A., i, 995.

preparation of substances resembling caoutchouc, A., i, 1003.

preparation of β -aryl, alkyl, or alkyl-aryl substituted hydroxylamines, A., i, 1015.

preparation of nuclear substituted mercuric derivatives of halogenated or nitrated phenols, or halogenated nitrophenols, A., i, 1056.

Farbwerke vorm. Meister, Lucius & Brüning, preparation of compounds of unsaturated acids with aldehydes, ketones, and formic acid, A., i, 107.

preparation of nitrophenyl mercaptans, A., i, 441.

preparation of o -chlorobenzotrichloride, A., i, 445.

preparation of 1:2-diaminoanthraquinone, A., i, 469.

preparation of arylanthraquinonyl-carbamides, A., i, 469, 595.

preparation of naphthanthraquinone-azines, A., i, 509.

preparation of anthraquinonylglycines, A., i, 548.

preparation of a nitro-1-aminophenyl-4-arsinic acid, A., i, 594, 760.

preparation of 2:2'-dianthraquinonyl-carbamide, A., i, 655.

preparation of phenylbenzyl dimethyl-ammoniumdisulphonic acid, A., i, 852.

- Farbwerke vorm. Meister, Lucius & Brüning.** preparation of 1:4-dihydroxynaphthalene monalkylethers, A., i, 854.

INDEX OF SUBJECTS.

TRANSACTIONS, PROCEEDINGS, AND ABSTRACTS. 1911.

(Marked T, P., and A., i and A., ii respectively.)

A.

- Abiotic acid**, isomeride of (BAKER and SMITH), A., i, 479.
- Abiatho**, detection of lanacetone in (see); PHILIPPE and V. FRIEDLBERG, A., ii, 1040.
- Absorption from the peritoneal cavity** (FISCHER), A., ii, 519.
- and digestion** (LONDON and KADINOWITSH; KRYNO), A., ii, 999.
- (LONDON and DAGIEFF), A., ii, 1000; (LONDON and GABRILOWITSH), A., ii, 1001.
- and digestion, defects of** (LONDON, DAGIEFF, STASSOFF, and HOLMBERG), A., ii, 998.
- Absorption spectra**. See under Photochemistry.
- Absorptive power**, influence of conjugated linkings on (CHAMBERLAIN, STEWART, WRIGHT, and GLENDENING), T., 451; P., 46; (CHAMBERLAIN, STEWART, WRIGHT, and REAY), T., 1262; P., 153.
- Acanthellin** (HESSE), A., i, 210.
- Acanthia and glycocholic** (HENDERSON and FISHERHILL), A., ii, 813.
- Accumulator**. See under Electrochemistry.
- Acenaphthenequinone** (LIEBERMANN and ZSCFFA), A., i, 203, 387.
- Acenaphthetolarin** (LIEBERMANN and ZSCFFA), A., i, 203.
- Acenaphthen-2-indole-indigotin**. See Indoxylacenaphthenone.
- Acenaphthenone, dichloro-** (LIEBERMANN and ZSCFFA), A., i, 387.
- Acenaphthen-2-thionaphthen-indigotin**. See Oxythionaphthenylacenaphthenone.
- Acetaldimine**. See 5-Methylamino-1:3-dimethylhydantoin.
- Acenaphthene**, oxidation of (KALLER and FOCK), A., i, 109.
- Acenaphthene**. 2-amino-3-hydroxy-2-nitro-1-naphthene; 2-nitro-3-hydroxy-2-nitro-1-naphthene (SACHS and MOSLEACH), A., i, 960.
- and reduction of** (CROMPTON and WALKER), P., 165.
- Acenaphthenequinone**, preparation of (KIESSEL), A., i, 729.
- derivatives of** (ALWEN, DANNHIL, and BOENSTOCKE), A., i, 171.
- Acenaphthenone**, preparation of (HADDON and ANGLIN & SODA FABRIK), A., i, 464.
- 2:3 Acenaphthylenediamine** (SACHS and MOSLEACH), A., i, 960.
- Acenaphthylene 3:4 thiocarbamide** (SACHS and MOSLEACH), A., i, 961.
- Acceperimidine** (SACHS and MOSLEACH), A., i, 961.
- Acetaldehyde**, formation of, from oxalates (CASASSINI and SANDOZZI), A., i, 121.
- and ethyl alcohol**, the system (DE LIELEW), A., ii, 870.
- paraaldehyde and metaaldehyde**, equilibrium in the system (SMITH and DE LIELEW), A., ii, 871.
- new condensation products of** (WAGSCHIEDER and SPAIN), A., i, 113.
- isomeric phenylhydrazones of** (LAWN and SHAW), T., 2085; P., 263.
- influence of the vapour of**, on the organism (SWANOFF), A., ii, 419.
- estimation of**, by means of pyrrole (SODOLEWA and ZALEWSKI), A., ii, 70.
- Paraldehyde**, assay of (RICHTER), A., ii, 773.
- Acetaldehydediethylhydrasone** (WIELAND and FRENKEL), A., i, 495.

- Acetaldehyde-hydrazine and its derivatives** (STOLLÉ), A., i, 421.
- Acetanilide**, preparation of (ROSENFELD, GULICK, and LARKIN), A., i, 529.
- bromo-, potassium salt, interaction of oxamethane with** (MAUGUIN), A., i, 368.
- cyno-, preparation of** (THOLE and THORPE), T., 429.
- iodo-oximino-** (STEINKOFF and JÜRGENS), A., i, 531.
- Acetamides**, substituted, acetylation of (FRANCHIMONT and DUBSKY), A., i, 529.
- Acetanilide**, detection of (WATSON), A., ii, 777.
- Acetanilide**, 3-chloro-2:4:6-tribromo-, (KÖNIG), A., i, 485.
- Acetic acid**, purification of (ORTON, EDWARDS, and KING), T., 1178; P., 120.
- purification and properties of** (BOUAFIELD and LOWRY), T., 1432; P., 187.
- distinction between glacial and anhydrous** (KLEIN), A., ii, 349.
- and its ethyl ester, ethyl alcohol and water, equilibrium between, and the influence of hydrochloric acid on the system** (JONES and LARWORTH), T., 1427; P., 143.
- influence of salts on the distribution of, between water and ethyl ether** (DE KOLAKOVSKY), A., ii, 591.
- influence of, on the growth of *Penicillium glaucum*** (REICHEL), A., ii, 144.
- hemolysis by** (STADLER and KLEEMAN), A., ii, 996.
- ammonium salt, use of, in the production of milk** (MORGEN, BEYER, and WESTHAUSER), A., ii, 751.
- basic chromic salt of** (GUSMANN), A., i, 103.
- dysprosium salt of** (JANTSCH and OHL), A., ii, 493.
- potassium salt, hydrates of** (ABE), A., i, 946.
- acid sodium salts of** (ANE), A., i, 599.
- strontium salt, solubility and hydrates of** (OSAKA and ABE), A., i, 599.
- amino- and p-acetylamino-benzoyl-methyl esters of** (KUNCKELL), A., i, 990.
- 1:8-dibromo-4-acetylamino-m-tolyl ester** (RAIFORD), A., i, 993.
- ethyl ester, preparation of** (KURTENACHER and HABERMANN), A., i, 600.
- i-β-octyl ester of** (PICKARD and KENTON), T., 66.
- Acetic acid, detection and estimation of small quantities of acetic anhydride in** (EDWARDS and ORTON), T., 1180; P., 121.
- Acetic acid, bromo-, ethyl ester, condensation of, with ethyl acetate methylglycidate** (DARZEN and SEJOURNÉ), A., i, 420.
- monobromo-, mono-, di-, and tri-chloro-, iodo-, and nitro-, methyl esters of** (COHEN), T., 100.
- chloro-chloral derivative of** (COHEN), A., i, 241.
- ethyl ester, condensation with** (WISLICENUS), A., i, 115.
- action of hydrazine hydrate on** (CURTIS and HUNSON), A., 400.
- mono-, di-, and tri-chloro-, electron conductivity of** (MAMELLI), A., 459.
- chloro-oximino-, and iodo-oximino-ethyl ester** (STEINKOFF and JÜRGENS), A., i, 530.
- cyno-, ethyl ester, action of** (SCHLAVY), A., i, 395.
- iodo-, phenyl and thymol ester** (FARBENFABRIKEN VORM F. BAYER & Co.), A., i, 630.
- dinitro-, ethyl ester, properties of, and its salts** (CURTISS and KOSTER), A., i, 518.
- Acetic anhydride, behaviour of, at high temperatures** (BAMBERGER), A., 103.
- action of, on uranium chloride** (VANINO), A., ii, 898.
- detection and estimation of small quantities of, in acetic acid** (EDWARDS and ORTON), T., 1180; P., 121.
- α-Acetic-4-methyl-o-coumaric acid -m-tolyl ester of** (FRIED and VON), A., i, 204.
- Acetin, α-monobromo-** (ALLEN and WEIZMANN), T., 84.
- Acetoacetic acid, and its ethyl ester derivatives of** (AUWERS, DANNEN, and BOENNECKE), A., i, 171.
- brucine salt** (HILDEBRAND), T., 234.
- ethyl ester, tautomerism of** (MEYER), A., i, 851, 833; (KNOHL, REICH, and AYERBECK), A., i, 177.
- (MEYER and KAUFMANN), A., i, 832.**
- keto-enolic equilibrium of** (HUTTENLOCHER), A., i, 602.
- sodium derivative, action of, on chlorides of dibasic fatty acids** (SCHREIBER and LUNGWITZ), A., 836.

- Acetoacetic acid**, γ -chloro, ethyl ester (LEMPHARD), A., i, 108.
 γ -dichloro, ethyl ester, and its salts (WILLIGENS), A., i, 108.
Acetoacetic acid, α , β -dichloro- (ALPERN and WEIHMANN), T., 86.
Acetoacetylaminopyridine (PALAZIO and TAMBURINI), A., i, 327.
Acetobornyl-p-nitroanilide (UELMANN and SCHMID), A., i, 71.
Acetobromodextrose, preparation of (FISCHER), A., i, 605.
Acetochlorodextrose, preparation of (FISCHER), A., i, 605.
Acetone, electrochemistry of solutions in (ROSENSTAMENSKY and LEWIS), T., 2135; P., 266.
 ethylation of (ZERNER), A., i, 950.
 velocities of reaction of, with phenyl hydrazine and with hydroxylamine (SCHOTTLE), A., ii, 1079.
 condensation of, in the presence of phosphoric acid (NEOGI), T., 1219; P., 71.
 brucine sulphite (MAYER, A., i, 223.
 estimation of, in animal fluids (SCOTT-WILSON), A., ii, 776.
Acetone, 1:3-diamino-, tetra-acetyl derivative of (FRANCHIMONT and DEBSKY), A., i, 528.
 a dichloro-, semicarbazones of (KNOPFER), A., i, 1034.
 dihydroxy-, as a product of alcoholic fermentation (KARAFSCHANOFF), A., ii, 914.
 glycogenic property of (MOSTOWSKI), A., ii, 635.
Acetone substances, influence of fat on the excretion of (FORSSNER), A., ii, 135.
 behaviour of, in carbohydrate metabolism (GEELMUYDEN), A., ii, 904.
Acetonedicarboxylic acid, brucine salt of (HILDITCH), T., 235.
Acetone- γ -diurethane, ethyl ester and its derivatives (FRANCHIMONT and DEBSKY), A., i, 528.
Acetonopinasone, methyl ethers of (LININKER), A., i, 523.
Acetonitrile, amino-, action of hydrogen sulphide on (JOHNSON and BUESHAM), A., i, 712.
 chloro-oximino- (STEINKOPF and JUNGES), A., i, 530.
 iodo-, reaction of with silver nitrate (LOY and ACKER), A., i, 360.
N-Acetonylantranilic acid, and its derivatives (HOUBEN, ARENDT, and EYNGER), A., i, 129.
1-Acetonylethylcarbazone, and its semicarbazone (DARZENS and ROSE), A., i, 989.
Acetonylethylbutylcarbazone, and its semicarbazone (DARZENS and ROSE), A., i, 989.
Acetonyl 2, 3, and 4 methylcyclohexane and their semicarbazones (DARZENS and ROSE), A., i, 989.
Acetonyl N-methylstrychnic acid, iodo- (KRAEPEL), A., i, 1017.
Acetonylstrychnic acid, iodo, and its derivatives (KRAEPEL), A., i, 1017.
Acetonylstrychnine, iodo, and its salts (KRAEPEL), A., i, 1017.
Acetophenone, bromination of (HANS), A., i, 649.
 compounds of aluminium halides with (MENSCHUTKIN), A., i, 65.
 hydric sulphite (MAYER), A., i, 223.
Acetophenone, amino-, and ω -amino- p -hydroxy-, halide salts of (MANNICH and HANS), A., i, 648.
 p -amino- ω -hydroxy-, ω -chloro- p -amino-, ω -chloro- α -, and ω -bromo- p -amino-, ω -chloro- α -nitro- p -amino-, and ω - β -dichloro- p -amino-, and their derivatives, and ω -chloro-2:5-dibromo-4-amino-, acetyl derivative (KUNCKEL), A., i, 300.
 dihydroxy-, and its derivatives (ANSCHUTZ and SCHOTT), A., i, 216.
 2:3:4:6-tetrahydroxy-, di-, tri-, and tetramethyl ethers of, and their derivatives (BARGELINI and BINI), A., i, 212.
Aceto- α -toluidide, 2:5-di-iodo-, (WHEELER and BEAUFLECHT), A., i, 27.
 5:6-di-iodo-, and 1:5:6-tri-iodo- (WHEELER and HOFFMAN), A., i, 28.
Aceto- β -toluidide, 2-chloro-5-nitro- (BRANKMAN), A., i, 39.
Acetoveratrone, dibromide of (HANS), A., i, 649.
Acetoveratrone, ω -amino-, hydrochloride, and ω -bromo- (MANNICH and HANS), A., i, 649.
 α -Acetoxycinnaldehyde, compound of, with tin tetrachloride (PYKIFFER, FEILDMANN, GOLDBERG, PRON, and SCHWABERGER), A., i, 789.
 α -Acetoxycinnole anhydride (EINHORN and SEUFFER), A., i, 54.
 α -2-Acetoxybenzoyloxybenzoic acid (acetylglutathionylidic acid) (EINHORN, HAAS, V. BAUGH, LADINCH, and ROTH-LATZ), A., i, 302.

- Acetoxyparaldehyde** and its hydrochloride (KUHARA and TODO), A., i, 214.
- 6-Acetoxyglucosaminic acid** (STOERMER, FRIDERICI, BEAUCOM, and NECKEL), A., i, 296.
- 6-Acetoxy-3,4-dimethyl- α -pyrone** (THOLE and THORPE), T., 2234.
- 1-Acetoxyhydrindene** (WEISSBERGER and BREHME), A., i, 324.
- 6-Acetoxymercurianillinocetic acid**, ethyl ester (SCHÖLLER, SCHRAUTH, and GOLDBACKER), A., i, 599.
- 6-Acetoxymercurianillinopropionic acid**, ethyl ester (SCHÖLLER, SCHRAUTH, and GOLDBACKER), A., i, 599.
- 6-Acetoxymercuri- β -methoxy- β -phenylpropionic acid**, methyl ester and derivatives (SCHRAUTH, SCHÖLLER, and STRUENSEE), A., i, 595.
- 6-Acetoxymercuri- β -ethoxy- β -phenylpropionic acid**, methyl ester, and its derivatives (SCHRAUTH, SCHÖLLER, and STRUENSEE), A., i, 595.
- 6-Acetoxymercuri- β -methoxy- β -phenylpropionic acid**, benzyl and ethyl esters (SCHRAUTH, SCHÖLLER, and STRUENSEE), A., i, 595.
- 6-Acetoxymercuri- β -propoxy- β -phenylpropionic acid**, methyl ester, and its derivatives (SCHRAUTH, SCHÖLLER, and STRUENSEE), A., i, 595.
- 6-Acetoxymercuri- β -isopropoxy- β -phenylpropionic acid**, methyl ester, and derivatives (SCHRAUTH, SCHÖLLER, and STRUENSEE), A., i, 595.
- 4-Acetoxy-6-methoxy- β -phenylpropionic acid**, 2-hydroxy-, lactone of (MOORE), T., 1048; P., 119.
- 4-Acetoxy-1-methylcyclopentane-2-carboxylic acid**, ethyl ester (HOPE and PERKIN), T., 771.
- 7-Acetoxy- α -phenyl- η -p-anisyl- Δ^2 -heptadien- ϵ -one**, β -bromo- (BAUER and DIETHELM), A., i, 882.
- β -Acetoxy- β -phenyl *tert*-butyl ketone**, ethyl ester (BLAISE and HERMAN), A., i, 881.
- β -Acetoxy- β -phenylpivalyl chloride** and toluide (BLAISE and HERMAN), A., i, 881.
- 3-Acetoxy-9-phenylxanthonium chloride** (POPE and HOWARD), T., 549.
- p-Acetoxytyrene**, ω -nitro- (REMFREY), T., 286; P., 21.
- 2-Acetoxy-m-tolonyl chloride** (ANSCHÜTZ and SCHOLL), A., i, 316.
- Aceto-m-xylylide**, 5-chloro- (ORTON and KING), T., 1188.
- Acetyl chloride**, action of, on acetylbiuret (OSTROGOVICH), A., i, 1036.
- Acetyl chloride**, condensation of, with salicylamide (TITCHELBY and HICKE), T., 866; P., 102.
- fluoride, di-bromo-** (SWARTZ), A., i, 762.
- Acetylacetone**, enolic forms of (KNOX and FISCHER), A., i, 977.
- thallium salt** (JAMES), A., ii, 592.
- zinc and cadmium salts of** (HEIM and GARFUNKEL), A., i, 427.
- Acetylacetonecarbamide**. See 441.
- methyl-2-pyrimidone**.
- Acetyl-*dl*- α -aminobutyric acid**, diethyl ester (ABDERHALDEN, CHANG, and WILSON), A., i, 526.
- Acetylaniline-3-sulphonic acid**, (thio) and its derivatives (CLAASZ), A., i, 436.
- Acetylanisole**, p-cyano- (BALCH, and FORLI-FORTI), A., i, 902.
- Acetylanthranil** (MAYER), A., i, 902.
- Acetylanthranylacetylhydrazide** (BERT, BELL, and AMEND), A., i, 162.
- Acetylanthranyl-m-aminotoluidide** (BERT, GORTNER, and AMEND), A., i, 581.
- Acetylauramine** and its derivatives (SUMNER), A., i, 579.
- Acetylbenzoic acid**, p-chloro-, and nitrile (KENCKELL), A., i, 991.
- Acetylbenzoic acid**, p-nitro- (FRANKE and KEANE), T., 346; P., 44.
- 1-Acetyl-4-benzylidenesulphantoine**, 2-thio- (WHEELER, NICOLET, and JOHNSON), A., i, 1032.
- Acetylbiuret**, action of acetyl chloride on (OSTROGOVICH), A., i, 1036.
- Acetylbornyl-p-phenylenediamine** (MANN and SCHMID), A., i, 71.
- Acetylcarbamide**, dichloro- (BENSON and WATER), A., i, 617.
- oximinocycano-** (MERCK), A., i, 167.
- Acetylcatechol**, ω -chloro-, and ω -methyl-, diacetates (MANNICH and HAHN), A., i, 649.
- 2-Acetyl-1-3-dihydroisindole** (TITCHELBY), A., i, 810.
- 13-Acetyl-5-13-dihydroquinoline** and 5-10-dibromo- (FICHTER and KERN), A., i, 86.
- 3-Acetyl-2,4-dimethylpyrrole**, hydrazide of (KNOX and HESS), A., i, 1020.
- Acetylene**, fusibility curve of, and methyl ether (BAUME and GEMMANN), A., i, 830.
- di-iodide**, synthesis of fumaric and maleic acids from (KEISER and MCMASTER), A., i, 948.
- Acetylene**, chloro-, preparation of (RIGUEZ MOURELO, and GARCIA RANFA), A., i, 414.

- Acetylene**, cyano-, preparation of (MOORE and BONGRAND), A., i, 22.
- cyano-, and dicyano-, toxicity of, and the antitoxic action of sodium thio-sulphate towards the latter (DES-GRELL, A., ii, 75d).
- d-iodo-, preparation of, and its compounds with organic bases (DEHN), A., i, 829.
- Acetylenes**, cyclic, preparation of (ANDER), A., i, 277.
- Acetylenedicarbaldehyde** (DUPONT), A., i, 804.
- Acetylenedibutylene** (DUPONT), A., i, 804.
- Acetylenedicarboxylic acid**, menthyl esters of (HILDITCH), T., 223; P., 6.
- Acetylenedicarbaldehyde** (DUPONT), A., i, 804.
- Acetylenediacetaldehyde** (DUPONT), A., i, 804.
- Acetylgelamine** and its hydrochloride (MOORE), T., 1232; P., 157.
- Acetyllysine**, iodo-, (ABDERHALDEN, HIRSCH, and GUGGENHEIM), A., i, 834.
- Acetylguanidine**, and chloro-, and *tri* chloro- (TRAUBE), A., i, 115.
- Acetylhomopiperonylamine** (FABREN-FABRIKEN VORM. F. BAYER & CO.), A., i, 1015.
- Acetylhydantonic acid**, thio-, and its ethyl ester and potassium salt (WHEILER, NICOLET, and JOHNSON), A., i, 1032.
- 3 Acetylindole**, phenylhydrazone of (OHIO and SESSA), A., i, 487.
- Acetylkinine** (SIMONSEN), T., 1533.
- Acetylmethylcarbamide**, oximinocyanide (MERCK), A., i, 167.
- 4 Acetyl-1-methylcyclohexane** and its derivatives (WALLACH and RITTER), A., i, 472.
- 3 Acetyl-1-methylcyclohexan-3-ol**, semicarbazone of (HAWORTH, PERKIN, and WALLACH), T., 131.
- 3 Acetyl-1-methyl- Δ^2 -cyclohexene** and its derivatives (HAWORTH, PERKIN, and WALLACH), T., 128.
- 3 Acetyl-8-methylcyclohexane** and its derivatives (CROSSLAND and RENOFF), T., 1111; P., 137.
- 1 Acetyl-4-methylhydantonic acid**, thio- (WHEILER, NICOLET, and JOHNSON), A., i, 1032.
- 1 Acetyl-2-methylindole** and its salts (DIELS and KOLLISCH), A., i, 231.
- Acetylmorphine**, chloro- (WIELAND and KAPPELMAYER), A., i, 746.
- 2 Acetyl- α -naphthol**. See *B-Naphthyl methyl ketone*, 1-hydroxy-.
- Acetylintramethylisochromipic anhydride** (WEGSCHNEIDER and KLENK), A., i, 542.
- 9 Acetylphenanthrene** and its derivatives (WELIGER and ALBERT), A., i, 882.
- Acetylphenylglycineacetic acid**, quinine ester of (OCHSNER), A., i, 760.
- 1 Acetylphenyl-2-methylbenzimidazole**, 4,7-dinitro-6-hydroxy-, and its acetic and phenylhydrazones (MELBOLA and KUNZEN), T., 41.
- Acetylpropylcarbamide** (MAGGON), A., i, 358.
- 8 Acetyl-8-oxo-propylvaleric acid** and its semicarbazone (WALLACH and CHAL-LENDER), A., i, 472.
- Acetylpyrogallol**, α -chloro-, and ω -iodo-, triacetates (MANNICH and HAHN), A., i, 449.
- Acetylpyrogallol trimethyl ether**, and bromide (MANNICH and HAHN), A., i, 449.
- Acetylpyrotartaric acid**, methyl ester, a reaction of magnesium organic compounds on (BAILLIE and LOQUIN), A., i, 708.
- 7 Acetylquinolinium bromide** (FICHTER and FORTNER), A., i, 86.
- Acetylsalicylaldehyde**. See *o-Acetoxybenzaldehyde*.
- Acetylsantalol**, chloro- (FABREN-FABRIKEN VORM. F. BAYER & CO.), A., i, 107.
- Acetylsalicylsalicylic acid**. See *o-2-Acetoxybenzoylsalicylic acid*.
- 4 Acetyltoluenesulphonylaminobenzene**, 3-nitro-, 2,4-, and 2,5-dinitro- (REVERDIN and DE LUC), A., i, 38.
- 4 Acetyltoluenesulphonylaminotoluene** (REVERDIN and DE LUC), A., i, 38.
- Acetyloxy-toluidine**, α -chloro- (KUNSCHE), A., i, 391.
- Acetylveratrole**, chloro-, and cyano- (BAERENTSEN and FOLLEFORD), A., i, 502.
- Acid**, $C_6H_5O_2$, and its silver salt, from peracetic acid (ANGSTROM), A., i, 1004.
- $C_6H_5O_2$, from oxidation of 1:1-dimethylcyclopentane-2-ol and its silver salt (KJERNER), A., i, 43.
- $C_6H_5O_2$, from condensation of crotonaldehyde and its barium salt (SMITH), T., 1032.
- $C_6H_5O_2$, from oxidation of 1:1-dimethyl Δ^2 -cyclopentane (KJERNER and VOZNESENSKY), A., i, 968.
- $C_6H_5O_2$, and its sodium salt from bromoisocamphenilic acid (HEXNERSON and HEILBRON), T., 1894; P., 249.

Acid, $C_{15}H_{25}O_2$, from oxidation of a-phytol, and its derivatives (WILLSTATTER, MEYER, and HENI), A., i, 149.

$C_{11}H_{19}O_2$, from oxidation of ethyl a-cyanocinnamylidenacetate (REIMER), A., i, 448.

$C_{11}H_{19}O_2N$, and its salts, from tribromo- β -phthaliminopropylene (GABRIEL), A., i, 982.

$C_{11}H_{19}O_2$, and its silver salt, from picrotin (ANGELICO), A., i, 1004.

$C_{12}H_{21}O_2$, from oxidation of curcumone (RUPE and STEINBACH), A., i, 69.

$C_{12}H_{21}O_2$, from oxidation of curcumone (RUPE and STEINBACH), A., i, 69.

$C_{12}H_{21}O_2$, from linallyl bromide and ethyl sodiummalonate, and its ethyl ester (ROURE-BERTRAND FILS, DE PONTY and LABAUNE), A., i, 895.

$C_{12}H_{21}O_2$, from the oxidation of 1-methyl-4-isopropyl-3-allylcyclohexan-3-ol, and its salts (SAVIZEFF), A., i, 474.

$C_{13}H_{25}O_2$, from ethyl camphorylideneacyacetate and hydrogen peroxide (FORSTER and WITHERS), P., 327.

$C_{13}H_{25}O_2$, from dimethylalhydrovalolactone and magnesium methyl iodide (LOWANITSON), A., i, 804.

$C_{13}H_{25}O_2N$, from iodomagnesium derivative of carbazole (ODDO), A., i, 488.

$C_{13}H_{25}O_2N$, from iodomagnesium derivative of diphenylamine and its salts (ODDO), A., i, 489.

$C_{13}H_{25}O_2N (+ H_2O)$, from ethyl camphorylideneacyacetate and hydrogen peroxide (FORSTER and WITHERS), P., 327.

$C_{14}H_{27}O_2$, from picrotin (ANGELICO), A., i, 1004.

$C_{14}H_{27}O_2$, from oxidation of a-phytol, and its silver salt (WILLSTATTER, MEYER, and HENI), A., i, 149.

$C_{15}H_{27}O_2$, product from the preparation of ethyl phloroglucinoldicarbonylate (LEUCHS and SIMON), A., i, 646.

$C_{15}H_{27}O_2$, from cod-liver oil (HIZDUSCHKA and RHEINBERGER), A., i, 766.

$C_{15}H_{27}O_2$, and its methyl ester from oxidation of ethyl a-cyanocinnamylidenacetate (REIMER), A., i, 448.

$C_{15}H_{27}O_2$, from phenylpropionic acid and benzophenone (PATERNO and CHIEFFI), A., i, 65.

$C_{15}H_{27}O_2N$, from the preparation of nitrogallio acid trimethyl ether (HARDING), T., 1595.

Acid, $C_{15}H_{25}O_2N$, from cactochelin, and its salts (CITRA and SCAGLIARINI), A., i, 155.

$C_{22}H_{39}O_2$, from oleic or elaidic acid and formaldehyde, and its derivative (FORIS), A., i, 765.

$C_{22}H_{39}O_2$, from oleic or elaidic acid and formaldehyde, and its acetyl derivative (FORIS), A., i, 765.

$C_{22}H_{39}O_2$, from M-diphenyl a-allylfulgenic acid (STROBE, BENARI, and SEYDEL), A., i, 380.

$C_{22}H_{39}O_2$, from oxidation of diglyceric acid, and its magnesium salt (KILLIAN), A., i, 139.

$C_{22}H_{39}O_2N$, from phenylmethylethylquinoline (STAUDINGER and LITZKA), A., i, 464.

$C_{22}H_{39}O_2$, from oxidation of diglyceric acid, and its barium salt (KILLIAN), A., i, 139.

Acids, relation between the structure and their catalytic activity (HALL and McMILLAN), A., ii, 33.

activity of, as catalysts (DANIEL, T., 1).

hydrolytic activities of (WOLFE), 349.

solubility of salts in the corresponding (MASSON), T., 1132; P., 125.

adsorption of, by sheep's wool (V. GEORGIEVICS and POLJANSKI), ii, 1070.

standardisation of, by sodium phosphate (FREDRAUX), A., ii, 1122.

action of, with benzophenone (PATERNO and CHIEFFI), A., i, 65.

excretion of (HENDERSON), A., ii, 77.

antagonism of the toxic action of salts (LOEB and WASTENEYS), A., ii, 755.

action of weak, on the blood vessels (SCHWARTZ and LEMBERGER), A., 809.

fixation of, by proteins (RINGER), A., i, 406.

in soil (SCHREINER and SHOLEY), A., ii, 147; (HALL and MILLER), A., 429.

alicyclic unsaturated, reduction (WALLACH), A., i, 472.

aromatic, catalytic esterification (SENDERENS and ABOTLENC), A., 637.

carboxylic, preparation of secondary amines from (LE SUEUR), T., 104.

degradation of, in the body (FELDMANN), A., ii, 910.

dibasic, catalytic esterification of (SENDERENS and ABOTLENC), A., ii, 1080.

- acids, dicarboxylic, action of magnesium organic compounds on anhydrides of (BAUER, BAUER and WÖLZ, A., i, 871).
- fatty, from cochineal (HERRER, A., i, 766).
- in cod-liver oil (HEIDUSCHKA and RHEINBERGER, A., i, 766).
- latent heat of fusion and specific heat of (MARSHALL and FAUCON, A., ii, 853).
- electrolysis of solutions of salts of, in the corresponding acids (HÖRIGARTNER, A., ii, 849).
- haemolytic power of (SHIMAZONO, A., i, 765).
- compounds of, with cholesterol (PARTINGTON, T., 313; P., 14).
- halogen derivatives of, rotation of the menthyl esters of the (COHEN, T., 1058; P., 123).
- formation of formic acid in the katabolism of (DAKIN and WAKEMAN, A., ii, 623).
- ratio of, to unsaponifiable substances in the organism (CONSTANTINO, A., ii, 627).
- estimation of (SIMMICH, A., ii, 233).
- estimation of, in fats, in presence of soaps (HOLBE and MARCUSSEN, A., ii, 1037).
- bromo-substituted, interaction of esters of, with silver nitrate in alcoholic solution (SENIER, T., 95).
- a bromo-, menthyl esters of (CHRISTOPHER and HILDEITCH, P., 312).
- dibasic, action of the chlorides of, on ethyl sodioacetate (SCHREIBER and LUNGWITZ, A., i, 836).
- fatty saturated, catalytic preparation of esters of (SENDERENS and ABDELKAC, A., i, 600).
- unsaturated, reactions of, with formaldehyde (FOXIN, A., i, 765).
- fatty, volatile, estimation of (EFFRONT, A., ii, 547).
- estimation of, in faeces (McCAUGHEY, A., ii, 666; (EDELSTEIN and WILDE, A., ii, 827).
- higher fatty, optically active derivatives of (HILDEITCH, P., 311).
- ammonium salts and separation of the (FALCIOLA, A., i, 5, 174).
- preparation of ketones of (EASTFIELD and TAYLOR, T., 2298; P., 279).
- acetylenic, oxidation of (ARNAUD and HASENPRATZ, A., i, 515).
- mineral, cryoscopy of (CORNEC, A., ii, 853).
- Acids, mineral, ingestion of, by the dog (LABBE and VIOLETTE, A., ii, 220).
- monobasic, from reducing sugars, action of the Bulgarian ferment on (BARTLAND and VILLON, A., ii, 221).
- organic, photolysis of, by ultra-violet light (BERTHELOT and GAUDICHON, A., ii, 170).
- conductivity and dissociation of (WEHMAN and JONES, A., ii, 689).
- classification of, according to valency (FAIK, A., ii, 711).
- influence of the structure of, on the stability of their carboxyl group (KATKOFF and TISCHKOFF, A., i, 445).
- containing alcoholic hydroxyl groups, basicity of (CAGLIARI and BERNARDINI, A., ii, 1078).
- interchange of alkyl groups in esters of (PIANCI, A., i, 783).
- preparation of esters of (ADMINISTRATION, DER MISEN VON BUCH-SWEILER AKT. GES., A., i, 601).
- oxidation of, by nitric acid in sunlight (BERNARDI, A., ii, 835).
- behaviour of mould fungi towards (HERZOG and RIEKE; HERZOG, RIEKE, and SALADIN, A., ii, 915).
- action of, with phosphoric acid (KATKOFF and TISCHKOFF, A., i, 445).
- action of, on sodium formate (OCHSNER DE CONINCK, A., i, 764).
- compounds of metallic salts of, with ammonia, pyridine and phenylhydrazine (GROSSMANN and JAGGER, A., i, 341).
- separation of mixtures of, by partial esterification (SCHIMMOROUGH and THOMAS, T., 2307; P., 279).
- saturated, esterification of (THOMAS and SCHIMMOROUGH, P., 314).
- standard, for use in acidimetry (EASTLE, A., ii, 66).
- unsaturated, esterification of (THOMAS and SCHIMMOROUGH, P., 314).
- compounds of, with aldehydes, ketones and formic acid (FARBWERKE VORM. MEISTER, LUCIUS & BRENING, A., i, 107).
- volatile, estimation of, in wines (WINDISCH and ROQUES), A., ii, 942; (VERDA, A., ii, 1037).
- detection of, microscopically (KANTOR, and GIEZ, A., ii, 446).
- estimation of, iodometrically (KOEFOED, A., ii, 67).
- estimation of, in tan liquors (PROCTER and SKYMOUR-JONES, A., ii, 76).

Acids. See also *α-Anilino-fatty acids*, *Hetero- and Iso-polyacids*.

Acid amides. See *Amides*.

Acid chlorides, compounds of aluminium chloride and bromide with (MEX-SCHUTKIN), A., i, 43.

action of, on the sodium derivative of phenylacetonitrile (BODEUX), A., i, 545.

Acid esters. See *Esters, acid*.

Acidity, measurement of, by potentials, in liquids containing carbon dioxide (HASSELBALCH), A., ii, 182.

Acidosis, action of chemical substances on (BAER and BLUM), A., ii, 512.

Aconitine, action of, on the isolated frog's heart and on nerves (HARTUNG), A., ii, 1016.

estimation of (RUBAT), A., ii, 551.

Acraldehyde, presence of, in bitter wines (VOISENET), A., ii, 1127.

enzyme producing, in bitter wines (VOISENET), A., ii, 915.

influence of the vapour of, on the organism (IWANOFF), A., ii, 419.

Acridine, pyridine and quinoline salts, chromoisomerism of (HANTZSCH), A., i, 673.

3,6-diamino- (CASSELLA & CO.), A., i, 504.

Acrylic acids, α -cyano-, preparation of derivatives of (CLARKE and FRANCIS), A., i, 205.

Actinium, γ -rays of (RUSSELL and SODDY), A., ii, 88.

emanation, transformation of the (GEIGER), A., ii, 683.

separation of, from residues (BOLTWOOD), A., ii, 359.

extraction of, from radium residues (v. WELSBACH), A., ii, 7.

Actinium C, half-period of (KOVÁČIK), A., ii, 173.

Acyl cyanides, formation of (VON LÄNDER, FRIEDBERG, VAN DER MERVE, ROSENTHAL, HUTH, and v. BODECKER), A., i, 865.

Acylanilides, chlorination of (KING and ORTON), T., 1377; P., 196.

Acyguanidines, aromatic, preparation of (PIERRON), A., i, 166.

α -**Acyhydrasines**, properties of (FRANZEN and KRAFT), A., i, 816.

Adaline (α -bromo- α -ethylbutyricamide), pharmacology of (FILIPPI), A., ii, 1120.

Adaline, α -bromo- (FARBENFABRIKEN VORM F. BAYER & CO.), A., i, 118.

Address, commemorative, to the Royal Academy of Sciences of Turin, P., 272.

Address, congratulatory, to King George V, P., 184.

to the University of St. Andrews, P., 185.

presidential (DIXON), T., 542.

Adenine, recovery of (BAENIST and JONES), A., i, 403.

Adipic acid -bisphenylhydrazide (SCHEIBER and LUNOWITZ), A., ii, 836.

Adipylsuccinacetic acid, chlorination (SCHEIBER and LUNOWITZ), A., ii, 836.

Adrenaline, formation of, in the adrenal body (FUNK), A., ii, 907.

mechanism of the action of (LUNOWITZ), A., ii, 754.

inactivation of (CRAMER), A., ii, 104.

production of diabetes by, and its inhibition by urethane esters (UNDERHILL), A., ii, 312.

production of glycosuria by, and thyroidectomy (UNDERHILL), A., ii, 137.

physiological activity and combination of (HAROLD, NIERENSTEIN and ROAF), A., ii, 136.

chemical toxicology of (VASSIL and GALLERANI), A., ii, 632.

influence of, on muscular activity (RADWANSKA), A., ii, 312.

effect of oxidation and salts of, on blood on the action of (NEUBAUER), A., ii, 312.

Adrenaline immunity (WATERBURY), A., ii, 1016.

Adsorption (RAKOWSKI), A., ii, 1742.

anomalous (BAYLISS), A., ii, 100.

(LOTTERMOSER), A., ii, 969.

relation between ionisation and (WALD), A., ii, 1068.

experiments on (ESTRUP), A., ii, 1012.

(LEVITES), A., ii, 868; (FELICANGI), A., ii, 1069.

of salts (LACHS and MICHAELS), A., ii, 190; (SCHERING), A., ii, 190.

in solution (v. GEORGIJEVSKI and POLLAK), A., ii, 1070.

of substances by charcoal (FELICANGI and MASUGI), A., ii, 374.

Aegirite from Quincy pegmatite (PATER and WARREN), A., ii, 615.

AFFINITY, CHEMICAL:—

Afinity, influence of, in solution (KÖZSA), A., ii, 1073.

chemical (BRÖNSTED), A., ii, 1073.

Chemical equilibrium in reversible actions (MICHAEL and LEFFLER), A., i, 250.

of carbon monoxide with carbon dioxide and carbon (KREIG and WHEELER), T., 1149; P., 126.

AFFINITY, CHEMICAL:—

- Kinetic, chemical, integrals of (JÜTTER), A., ii, 972.
 of irreversible reactions (MARCELLIN), A., ii, 27.
 of the transformations of chloroalkylamines into heterocyclic compounds (FREUNDLICH and KARSTOVNIKOFF), A., ii, 266.
 of the reaction of bromine with formic acid (JOSEPH), A., ii, 334.
 of the action of hydrogen on solutions of potassium permanganate (JEST and KARKO), A., ii, 494.
 of the formation of oxonium dibromides in organic solvents (TACHELNERFF and KUNOWALOFF), A., ii, 706.
 Kinetic theory of gases in relation to thermodynamics (BENTHOUD), A., ii, 578.
 Reactivity, relation between and chemical constitution of nitrogen compounds (CLARKE), T., 1927; P., 243.

AFFINITY, CHEMICAL:—

- Dissolution, procedure of hydrated salts, determination of (PARTINGTON), T., 466; P., 45.
 Hydrolysis, dilatometric investigations of (GALEOTTI), A., ii, 257.
 Velocity of addition of bromine to imides (PITTI and CALCAGNI), A., i, 124.
 of alkyl bromides to cyclic tertiary bases (LONG), T., 2164; P., 243.
 Velocity of crystallisation (WAGNER; MARK), A., ii, 265.
 dependence of, on temperature (TAMMANN), A., ii, 376.
 Velocity of hydrolysis and viscosity, relation between (GRIEMEL), A., ii, 197.
 Velocity of chemical reaction, temperature coefficient of (TRAUTZ), A., ii, 381.
 Velocity of propagation of chemical reaction (SEBASTIAN), A., ii, 372.
 Velocity of racemisation (HEBE), A., ii, 974.
 Velocity of reaction in heterogeneous systems (BOSELI), A., ii, 198, 265.
 measurement of, by means of viscosity (DENSLER and MURRAY), T., 565; P., 59.
 influence of neutral salts on (POMA), A., ii, 707.
 influence of neutral solvents on (PATTERSON and MONTGOMERY), P., 276.
 of metals with dissolved iodine (VAN NAME and BOWWORTH), A., ii, 973.
 Velocity of the ring opening in unsaturated systems (BOESEKEN and SCHWABER), A., ii, 197.
 Velocity of solution of metallic copper in aqueous ammonia (YAMASAKI), A., ii, 383.
 Periodic reactions (HUBNIK), A., ii, 129.
 Agglutinins, vegetable (ANSMANN), A., ii, 129.
 Agriculture, colloids in relation to (RAMANN), A., ii, 529.
 use of sewage in (MUNTZ and LAINE), A., ii, 761.
 Air. See Atmospheric air.
 Alanine, oxidation of (DENIA), A., i, 773.
 complex chromium salt of (TCHUGAEFF and SERNIN), A., i, 116.
 d/ Alanine/ethiocarboxylic acid, benzyl hydrogen ester of (SIZOVNIK and WEIDENHAUPT), A., i, 116.
 Albumin in plant cells (LOEW and BOKORST), A., ii, 324.

- Albumin**, isoelectric point of (MICHAELIS and DAVIDSON), A., i, 697.
 cause of separation of, in beer (EMSLANDER), A., i, 938.
 inner anhydride reaction of (BAR-DACH), A., ii, 945.
 iodo-, hydrolysis of (OSWALD), A., i, 697.
 detection of, by Heller's test (MICHEL), A., ii, 347.
 detection of, microscopically (BOKORNY), A., ii, 236.
 estimation of, gravimetrically in urine (SIMONOT), A., ii, 945.
 α - and β -Alcaptochromes (MÖRNER), A., i, 56.
Alcaptonuria, chemical nature of (DAKIN; WAKEMAN and DAKIN), A., ii, 416.
Alcohol. See Ethyl alcohol.
Alcohol, C_2H_5O , from reduction of ester $C_2H_5O_2$ (PETROFF), A., i, 974.
 C_2H_5O , and its acid phthalate, from oxidation of camphene (HENDERSON and SUTHERLAND), T., 1549; P., 212.
 C_2H_5O , from carvone and magnesium ethyl iodide (VANIS), A., i, 474.
 C_2H_5O , from linalyl bromide and ethyl sodiomalonate and its derivatives (ROURE-BERTRAND FILS, DUPONT, and LABAUNE), A., i, 595.
 C_2H_5O , from oxidation of 1-methyl-4-isopropyl-3-allylcyclohexan-3-ol (SAYTZEFF), A., i, 474.
Alcohols, absorption of heat on mixing (DOROSCHEWSKY), A., ii, 468.
 partial pressures in mixtures of, and water (DOROSCHEWSKY), A., ii, 1062.
 of the hydroaromatic and terpene series (PICKARD and LITTLEBURY), P., 324.
 of the diphenyl- and triphenyl-methane series, reduction of (TSCHITSCHIBASIN), A., i, 277.
 of the cyclohexane series, synthesis of (MAILHE and MUKAT), A., i, 126.
 action of thionyl chloride on, in presence of a tertiary base (DARZEN), A., i, 513.
 compounds of, with ethyl metaphosphate (LANGHELD), A., i, 708.
 action of, on green plants and on bacteria (BOKORNY), A., ii, 522.
 acetylenic, preparation of (LEPIEAT), A., i, 347.
 aminoaryl, preparation of (EMDE and RUNZE), A., i, 718.
 aromatic and hydroaromatic containing the allyl group, synthesis of (MATCHURVITSCH), A., i, 961.
Alcohols, cyclic, catalytic dehydration of (IPAYEV), A., i, 25.
 higher fatty, optically active derivatives of (HILDITCH), P., 311.
 olefinic, preparation of (FAKKESTADT-KEN VORM. F. BAYER & CO.), A., i, 598.
 polyhydric, phosphoric acid esters of (CARRÉ), A., i, 263.
 primary and secondary, preparation of bromides from (TABOUY), A., i, 173.
 secondary, of the fatty series, esters of (PICKARD and KENYON), T., 45.
 unsaturated cyclic, reduction of (WALLACH), A., i, 470.
Aldehyds, diacetates, preparation of (WOHL and MAAG), A., i, 13.
Aldehydes, explanation of the reaction of, by polarity (DERICK), A., ii, 712.
 action of, with hydrogen peroxide (BLOCH, HÖHN, and BUEGE), A., i, 46; (BUEGE and BLOCH), A., i, 46.
 action of hydrazine on (STAUDENBERG and KUPFER), A., i, 751.
 compounds of, with unsaturated acids (FAKKESTADT-KEN VORM. F. BAYER, LUTJUS, & BRUNING), A., i, 17.
 oxidation of, in alkaline solution (HEINROD and LEVENE), A., i, 17.
 aromatic, electrolytic reduction of (LAW), T., 1113; P., 13.
 condensation of, with nitromethane (REMFRY), T., 282; P., 21.
 colour reactions of, applied to analysis of spirits (V. FRIEDBERG), A., ii, 667.
 mixed, action of, with hydrazobenzene (RASSOW and BURMEISTER), A., i, 820.
 phenolic (PAULY and V. BURTEL), A., i, 785; (PAULY, SCHUBEL, and LOCKEMANN), A., i, 787.
 Angeli-Rimini reaction for (BALEANO), A., i, 987.
Aldehydes, nitro-, conversion of into cyanoaldehydes (PONZIO), A., i, 93.
2-Aldehydodiphenylquinomethane (BISTEZYCKI and FELLMANN), A., i, 14.
4-Aldehydo-2(or 3)-methylphenylacetic acid, ethyl ester and semicarbazide (AUWERS), A., i, 298.
6-Aldehydo-n-nonolic acid, methyl ester and its semicarbazone (HARRIS, WALSH, and WEIZMANN), T., 41.
3-Aldehydosalicylic acid, ethyl ester and phenylhydrazones, and 5-aminophenylhydrazones (REMFRY), T., 286; P., 21.
5-Aldehydosalicylic acid and its ethyl ester, and their phenylhydrazones, and 3-nitro-, and its ethyl ester (REMFRY), T., 286; P., 21.

- 3-Aldehydetriphenylarsinet, 4-hydroxy-, derivatives of (BISTRZYCKI and FELLMANN), A., i, 133.
- 3-Aldehydetriphenylarsinic acid, 4-hydroxy-, salts and derivatives of (BISTRZYCKI and FELLMANN), A., i, 133.
- Alkal. derivatives of (WEGSCHEIDER and SPATH), A., i, 112.
- Aldesines, N-alkylated, preparation of (SCHWEISS), A., i, 332.
- Aldehydes, preparation of (DINSTEIN and THOLE), P., 233.
- Algae, action of strontium salts on (LOEW), A., ii, 322.
- marine, arsenic in (TASSILLY and LEBON), A., ii, 142.
- Allylic compounds, reduction of (WALLACH), A., i, 469.
- Alisaria, occurrence of, in rhubarb (MULLER), T., 967; P., 101.
- Alkali carbonates, estimation of, volumetrically, in presence of alkali hydroxides and bicarbonates (TILMANN and HEUBLEIN), A., ii, 658.
- hydrogen carbonates, the dissociation pressures of (CAVEN and SAND), T., 1359; P., 147.
- cyanide, estimation of sulphides in (ROSWITER), A., ii, 654.
- fluorides, hydrofluorides of DE FORCRAND), A., ii, 583.
- halogen salts, changes in volume on solution in water of the (BAXTER), A., ii, 589.
- manufacture, electrode potentials in (SACERDOTI), A., ii, 789.
- metals, preparation of (HACKPILL), A., ii, 602.
- emission spectra of the, in the glow discharge (GERLHOFF), A., ii, 83.
- fluorescence of the vapours of (DENYER), A., ii, 832.
- dispersion of light by vapours of the (BEVAN), A., ii, 349.
- radiations of the (HENRIOT), A., ii, 354.
- electrical properties of (BRONIEWSKI and HACKPILL), A., ii, 1055.
- velocity of ions of salts of, in flames (WILSON), A., ii, 572.
- production of negative electrons by the (FREDENHAGEN), A., ii, 571.
- positive ions emitted by salts of the (RICHARDSON), A., ii, 940.
- conduction of electricity in the vapour of the (FECHTBAUER), A., ii, 361.
- variation in the physical constants of, on fusion (HACKPILL), A., ii, 185.
- Alkali metals, refractive indices of the halogen salts of the (BAXTER, BOYLSTON, MULLER, BLACK, and GOODE), A., ii, 557.
- thermochemistry of compounds of the (DE FORCRAND), A., ii, 96.
- colloidal, photoelectric effects of (PONI and PRINGSHEIM), A., ii, 363.
- action of, on water (HACKPILL and BOSSERT), A., ii, 392.
- excretion of, in purine diuretics (ROCK), A., ii, 631.
- nitrate, equilibrium in ternary systems of (MENDIES and DUTT), A., ii, 832.
- phosphate in meat juice (SALKOWSKI), A., ii, 39.
- sulphates, formation of double salts by the (FOOTE), A., ii, 393.
- double salts of, with sparingly soluble sulphates (BARKER), A., ii, 579.
- Alkalis in soil (HALL and MILLER), A., ii, 429.
- action of chlorine on (TAYLOR), T., 1906; P., 243.
- estimation of, in blood (BENSHARDT), A., ii, 1031.
- Alkaline earth carbonates, carbon dioxide and water, equilibrium between (McCOY and SMITH), A., ii, 830.
- caseinogenates, conductivity of (ROBERTSON), A., ii, 460.
- globulins, dissociation in solution of (ROBERTSON), A., i, 406.
- metals, thermochemistry of compounds of the (DE FORCRAND), A., ii, 96.
- antagonism of salts of, to potassium poisoning (LOEB and WASTENEYS), A., ii, 637.
- replacement of, in neuro-muscular mechanisms (MINES), A., ii, 413.
- periodides and perbromides of the (HEEZ and BULLA), A., ii, 801.
- sulphides, phosphorescence of the (RAUSCHER, HAUSNER, and OEDER), A., ii, 237; (PAPILL), A., ii, 351.
- Alkaline earths, compounds of ammoniumnitrate with (QUANTAROLI), A., ii, 489.
- Alkaloid, $C_{10}H_{15}O_4N$, from sterilised milk (AWERKIEFF), A., ii, 752.
- Alkaloids, hydrogenation of (SKITA and FRANCK), A., i, 1017.
- formation of periodides of (HOLMEN), A., i, 967.
- solubility of, in a mixture of boric acid and glycerol (BARONI and BOBINETTO), A., i, 903.
- angostura. See Angostura alkaloids.
- cinchona. See Cinchona alkaloids.
- corydalis. See Corydalis alkaloids.

Alkaloids, ipocacuanha. See *Ipecacuanha alkaloids*.
morphine. See *Morphine alkaloids*.
opium. See *Opium alkaloids*.
 of *Parera* root. See *Parera* root.
quinina. See *Quinine alkaloids*.
 from *taquinoline*. See *taquinoline*.
Senecio. See *Senecio alkaloids*.
 from *strychnos*. See *Strychnos*.
 genesis of, in plants (CHAMICIAN and RAVENNA), A., ii, 761.
 in the seed of *Datura metel* (SCHMIDT), A., ii, 143.
 of the *Papaveraceae* (GADAMER), A., i, 317.
 of *Zygadenus intermedius*, physiological effects of (MITCHELL and SMITH), A., ii, 911.
 neutralization of, by extracts of the testis and epididymis (METALNIKOFF), A., ii, 217.
 distinction between the (KLEIN), A., ii, 341.
 estimation of, in cinchona bark (VIGNERON), A., ii, 234.
Alkyl bromides, preparation of, from alcohols (TABOURY), A., i, 173.
 course of the intramolecular transformations of (MICHAEL and LEUFOLD), A., i, 250.
 velocity of addition of, to cyclic tertiary bases (LANG), T., 2164; P., 293.
 halides, action of, on acid anhydrides (VANIN), A., i, 416.
 halogen derivatives, preparation of (v. BRAUN and SOBECKI), A., i, 597.
 iodides, action of copper oxide on (DENHAM), A., ii, 804.
 sulphates, metallic, hydrolysis of (DRUSHEL and LINHART), A., ii, 707.
Alkylamines, estimation of, in urine (ERDMANN), A., ii, 551.
 chloro-, kinetics of the transformation of, into heterocyclic compounds (FRUNDLICH and KRESTOVNIKOFF), A., ii, 266.
Alkylamino/dithiocarbamic acids, salts and esters of (FOURNEAU), A., i, 523.
Alkylammonium nitrites (RAY and RAKSHIT), P., 71, 261, 291.
Alkylanthraquinones, preparation of (SEER), A., i, 386.
Alkylglyoxalines, amino- (PRYMAN), T., 2172; P., 275.
Alkyl groups, interchange of, in acid esters (KOMNENOS), A., i, 260.
m-p **Alkylhydroxyphenylethylamines**, preparation of (AKTIEN-GESellschaft für ANILIN-FABRIKATION), A., i, 557.

Alkylhydroxytriazines, catalytic decomposition of, as a method of preparation of hydrocarbons (KUNER, A., i, 1927; (KUNER and ZANAGHINI), A., i, 1023.
Alkylidene-urethanes, reaction between β -dicarboxylic compounds and (CHI and SCHIFF), A., i, 977.
Alkylloxides, preparation of (CHAMICIAN), A., i, 839.
 action of hydrogen sulphide on (RULE), T., 558; P., 69.
m-Alkyl-oxo-acids, synthesis of from chloroethoxyacetic acid (BLAKE and PICARD), A., i, 349.
 action of the chlorides of, on organic compounds (BLAKE and PICARD), A., i, 175, 269.
Allantoins, presence of, in foods (ROYD), A., ii, 308.
 importance of, in purine metabolism (HUNTER and GIVENS), A., ii, 23.
Allaneketones, attempts to prepare (STAUDINGER and OTT), A., i, 46.
Allium sativum (garlic), action of lead and mercury (BANERJEE, P., 214).
d-Alloxolactone (LEVENE and JACOB), A., i, 15.
Allophane, composition of (THOMAS), A., ii, 210; (STREMMER), A., ii, 501.
 colour reactions of (THOMAS), A., 501.
Allophanic acid, aloin salt of (VIERING), A., i, 490.
 amyl ester (CHEMISCHE WERKE von Dr. H. BYK), A., i, 118.
 isobutyl and tert.-amyl esters (FRY), T., 624; P., 73.
m-methyl-8-trichloroethyl and *o-o*-chloroethyl esters of (VIERING), A., i, 118.
d-Allose, and its *p*-bromophenylhydrazone (LEVENE and JACOB), A., i, 17.
Allotropy, new theory of (SMITH and LEEUW), A., ii, 263.
Alloxan, decomposition of (GORTAL), A., i, 325.
 relation of, to triketohydrate hydrate (RUHEMANN), T., 792; P., 97.
 derivatives of (PELLIZZARI and TONI), A., i, 337.
 oxidation of amino-acids by (TRACER), A., 960.
 interaction of, and glycine (HUNTER and WOOTTON), T., 288; P., 2.
5-Alloxan-3-allylrhodanic acid (BESCHER), A., i, 333.
5-Alloxan-8-methylrhodanic acid (BESCHER), A., i, 333.

- 2-Alloxan-3-phenylrhodanic acid** (BUT-
CHER), A., i, 333.
- 2-Alloxan-3-p-tolylrhodanic acid** (BUT-
CHER), A., i, 333.
- Alloys, density of** (FRILLEY), A., ii,
879.
- catretic, composition of** (LOSEFF), A.,
ii, 496.
- ferroly magnetic, magnetic constants of**
(GROSOTTO and RINGHINOTTO), A.,
ii, 251.
- microscopic examination of** (LE
CHATELIER), A., ii, 894.
- quantitative analysis of** (KORTE), A.,
ii, 155.
- resistant, action of phosphoric acid on**
(WINDER and JEANNERET), A., ii,
719.
- ethyl alcohol, phenylurethane of** (PAR-
SELLER), A., i, 941.
- ethylaminoacetic acid, methyl ester**
(FRANKLAND and O'SULLIVAN), T.,
2324, p. 319.
- ethylcarbinol, derivatives of** (PAR-
SELLER), A., i, 940.
- Allylglycine, and its ethyl ester**
(ALLEN and WEIZMANN), T., 86.
- Allylcyclohexan-1-ol** (MATSCHKE-
VITTM), A., i, 962.
- ethylaminoacetic acid, diphenyl ester**
(HEIMISCHER FABRIK LADENBURG),
A., i, 438.
- Malonic acid, esters of, condensa-
tion of thiocarbamide with** (JOHNSON
and HILL), A., i, 502.
- Allyloxanthranol** (KONDO), A., i, 67.
- Allylphthalamic acid** (JOHNSON and
JONES), A., i, 455.
- Allylthiophen** (GRISHKEWITSCH THEO-
CHIMOWSKY), A., i, 481.
- ethylvalerolactone- α -carbonylthiocarb-
amide** (JOHNSON and HILL), A., i, 503.
- lmond, lipolytic enzyme in** (TONE-
GUTH), A., ii, 525.
- leucodin, rhein, and chrysophanic
acid, relation between** (OESTERLE),
A., i, 887.
- nitro-** (LÉGER), A., i, 140.
- leis allophanate, carbonate and ethyl
carbonate** (VEREINIGTE CHINIS-
CHEN FABRIKEN ZIMMER & Co.), A., i,
450.
- formic acetic esters of** (FABER
FABRIKEN VORM. F. RAYE & Co.),
A., i, 659.
- leis, action of nitric acid on** (LÉGER),
A., i, 140, 734.
- loxanhydrazine** (RICHTER), A., i, 757.
- loxantia, constitution of** (RICHTER),
A., i, 756.
- Altronic acid, and its calcium salt**
(LEVENZ and JACOB), A., i, 15.
- Altronic, and its phenylomazone and
phenylbenzylhydrazone** (LEVENZ and
JACOB), A., i, 15.
- Alumina. See Aluminium oxide.**
- Aluminium, positive potential of**
(WRIGHT), A., ii, 456.
- instability of** (LE CHATELIER), A., ii,
398.
- amalgamated, use of, in analysis**
(KOHN-ARREST), A., ii, 673.
- preparation of ammonium salts from
nitrogen compounds of** (HADRICK
ANTH. & SODA FABRIK), A., ii,
1088.
- stopcocks, use of, for hydrogen sulph-
ide** (CAMPELL), A., ii, 596.
- influence of, on plant development**
(SILKMAN), A., ii, 643.
- absorption of, from food** (STIEL), A.,
ii, 507.
- compound of boric acid and** (CHEMI-
SCHE FABRIK GOSWIG-ASHALT), A.,
ii, 981.
- Aluminium alloys with magnesium**
(BRONIAWSKI), A., ii, 115; (WILM),
A., ii, 493.
- with zinc** (ROSENTHAL and ARCH-
BUTT), A., ii, 895.
- Aluminium apparatus** (MANIBAU), A.,
ii, 106.
- Aluminium salts, formulae of** (COOPER),
A., ii, 116; (OLIVIER), A., ii,
206.
- estimation of free acid and base volu-
metrically in** (CHAB), A., ii, 335.
- Aluminium bromide, conductivity of
solutions of, in nitrobenzene**
(PELNIKOFF), A., ii, 247.
- as a solvent** (LEPKOFF and PLOTNI-
KOFF), A., ii, 493.
- equilibrium of, with ethylene di-
bromide** (MENSCHUTKIN), A., i, 1.
- compounds of, with acid chlorides**
(MENSCHUTKIN), A., i, 45.
- chloride, compounds of with acid
chlorides** (MENSCHUTKIN), A., i,
45.
- action of, on benzene** (HOMER), A.,
i, 276.
- halides, compounds of, with aceto-
phenone and benzophenone** (MEN-
SCHUTKIN), A., i, 65.
- hydroxide, solubility of** (HERZ), A.,
ii, 728.
- precipitation of, in the granular
form** (FAYLOR), A., ii, 542.
- adsorption of arsenic by** (LOCKE-
MANN and FAUCKE), A., ii, 720.
- oxide (alumina) and silica in alloph-
ane, halloysite and montmorillon-
ite** (THEGUTT), A., ii, 210;
(STREMMER), A., ii, 406.

- Aluminium oxide, equilibrium of, calc-
ium oxide and silica** (SHERRECK,
BANKIN, and WRIGHT), A., ii,
725.
- separation of, and ferric oxide,
(BARNIER), A., ii, 70.
- phosphate, spectroscopic investigation
of the positive ions from heated
(HORTON), A., ii, 90.
- mobility of positive ions from
(TODD), A., ii, 1050.
- silicate minerals in soils (VAN DER
LEEDEN), A., ii, 299.
- sulphide (BILTZ and CASPARI), A., ii,
804.
- Alumosilicates, terminology of** (MONO-
ZEWICZ), A., ii, 121.
- Aluminium, microchemical detection of**
(SCHÖGEL), A., ii, 443.
- and its alloys, analysis of (KLEIN),
A., ii, 772.
- separation of, and glucinum (WUNDER
and CHELADZE), A., ii, 773.
- separation of ions from (CHARITSCH-
KOFF), A., ii, 543.
- separation of iron, chromium and,
(TCHARVIANI and WUNDER), A., ii,
156; (SCHIRM), A., ii, 936.
- Alumosilicates.** See under Aluminium.
- Alums, influence of acids on the crystal-
line form of** (WEYBORG), A., ii, 263.
- Alunite in the liparite from Grosseto**
(PANICHI), A., ii, 210.
- Alunite-bendandite group, minerals of**
the (SCHALLER), A., ii, 1101.
- Amalgams.** See Mercury alloys.
- Amanita muscaria.** See Fly agaric.
- Amber from Galicia** (NIEDZWIEDZKI),
A., ii, 497.
- Amides, action of isoamyl nitrite on**
(SMIRNOFF), A., i, 427.
- action of cotarnine on (KNOLL & CH.),
A., i, 670.
- action of hypobromous acid on (BOIS-
MONT), A., i, 957.
- action of oxalyl chloride on (BORN-
WATER), A., i, 616.
- compounds of chloral with (CHEMISCHE
FABRIK GEDEON RICHTER), A., i,
836.
- toxicity of (DESGREZ), A., ii, 1119.
- acid, alkylation of (MATSUI), A., i,
185.
- hydrolysis of (REID), A., ii, 477.
- halogenated, sodium derivatives of
(MAUVIN), A., i, 357.
- Amidines, tautomerism of** (PITTMERER),
A., i, 399.
- action of, on cyanoguanidine (OSTRO-
GOVICH), A., i, 332.
- Amidosulphonic acid, methyl ester**
(EPHRAIM and LAROCK), A., ii, 276.
- Amines, synthesis of, from carb-
on** (MILLER and MURAT), A., i, 100.
- capillary rise of (SKEAT and
PHILIPPI), A., ii, 587.
- combination of, with acetylenes
(ANDRÉ), A., i, 268.
- action of isoamyl nitrite on
(OFF), A., i, 427.
- compounds of, with ethyl methyl
ate (LANNHELD), A., i, 707.
- action of oxalyl chloride on
(BORNWATER), A., i, 616.
- action of, on triphenylcarbinol and
tritolylcarbinol (GREEN and W.
HEAD), A., i, 481.
- aliphatic, salts of pertitanic acid
(KIROVSKI and NISSENMAN), A.,
i, 183.
- aromatic, action of bornyl chloride
(ULLMANN and SCHMIDT), A., i,
elimination of halogens by
(MISLENSKY and ALARF), A.,
i, 534.
- nitration of (REVERDIN and
LUC), A., i, 37.
- primary, lactylation of (ELER and
SINNER), A., i, 191.
- cyclic, colour reactions of (LIGZT),
A., ii, 78.
- A**
cyanodihydrocyclic (KAUFMANN, WIL-
MER, and ALBERTINI), A., i, 76,
750.
- fatty, action of, on α -dibromosuccinic
acid (FRANKLAND and SMITH),
i, 320.
- secondary, preparation of, from
oxylic acids (LE SZER), T.,
P., 104.
- tertiary mixed, formation of (FRIED-
and SCHELLBACH), A., i, 281.
- Amino-acids, formation of, in the lab-**
(EMDEN and SCHMITZ), A., ii, 72.
- production of, in plants (FRANK-
A., ii, 323.
- preparation of (FISCHER and GROS-
A., i, 773.
- preparation of esters of (ZEHNERT,
ANNENKOFF, and KULIKOFF), A.,
773.
- attempts to prepare glycocides
(ALPERN and WEIZMANN), T.,
isolation of, from hydrolysis of pro-
teins (ABDERHALDEN and WEIL), A.,
i, 1049.
- of whalebone (ABDERHALDEN and
LANDAU), A., ii, 509.
- derivatives of (ABDERHALDEN and
BAUMANN), A., i, 543.
- oxidation of (DENT), A., i, 616, 773.
- oxidation of, by alloxan, isomeric
p-benzoquinone (TRAUBE), A.,
960.

- Amino-acids**, action of carbon disulphide on (SINOFIELD and WEIDENHAUPT), A., i, 114.
 change of, into hydroxy-acids by moulds (EHRICH and JACOBSEN), A., ii, 530.
 behaviour of mould fungi towards (HERZOG and SALADIN), A., ii, 915.
 degradation of, in yeast fermentation (NEUBAUER and FROMHERZ), A., i, 201.
 value of, in the dog's organism (ABDERHALDEN and MAKERWALDER), A., ii, 634; (ABDERHALDEN, FURNO, GORREL, and STRÜBEL), A., ii, 1002.
 excretion of, in disease (MASUDA), A., ii, 631.
 effects of loss of blood and prolonged inanition on the excretion of (FICH), A., ii, 58.
 complex chromium salts of (TSCHEGAYFF and SERBIN), A., i, 115.
 aromatic, alkylation of (WHEELER and HOFFMAN), A., i, 446.
 degradation of, in the body (SFWAL), A., ii, 634.
 free, in the intestine (ABDERHALDEN), A., ii, 1011.
 • **Amino-acids**, behaviour of, in animals (KNOOP and KERESSE), A., ii, 514.
Amino-alcohols, secondary, preparation of (LES ETABLISSEMENTS POLENE FRATRES and FOURNEAU), A., i, 231.
Aminoaryl alcohols. See Alcohols, aminoaryl.
Amino-compounds, aliphatic, action of oxygen on, in the presence of copper (TRAUBE), A., i, 940.
 aromatic, colorations produced by the interaction of, and nitro-compounds (WALTER), A., i, 343.
Amino group, aliphatic, estimation of the (VAN SLYKE), A., ii, 164.
Amino groups, estimation of (VAN SLYKE), A., ii, 944.
 apparatus for estimation of (KLEIN), A., ii, 1143.
 • **Aminoheterocyclic compounds** (FRANZEN and KRAFT), A., i, 816.
Amino ketones, N-alkylated, reduction of (EMDE and RENNE), A., i, 714.
 aromatic (KUNCKELL), A., i, 990.
 ethylenic β -substituted, preparation of (ANDRÉ), A., i, 268.
 • **Amino ketones** (GABRIEL), A., i, 212.
 synthesis of (MANNICH and HAHN), A., i, 648.
Aminophenols, formation of salts by (SUIDA), A., i, 234.
Amines persulphates, metallic (BARRISRI and CALZOLARI), A., ii, 839.
Aminodithylenediaminocobaltic salts, bromo- and chloro- (WERNER, KIRG, and SCHOLLE), A., i, 614.
Ammonia, formation of, from its elements (McDERMOTT), A., ii, 332.
 formation of, in the arc discharge (MAKOWITZKY), A., ii, 463.
 synthesis of (WOLTERECK), A., ii, 598.
 synthesis of, by heat (CARDELL and THOMAS), P., 138.
 catalytic synthesis of, by means of iron (JELINKE), A., ii, 798.
 from compounds containing nitrogen and carbon (SCHREIBER), A., ii, 551.
 liquid, use of, in chemical reactions (CHABLAY), A., i, 939.
 absorption of, from the atmosphere (HALL and MILLER), A., ii, 763.
 electrolysis of aqueous (MILLER), A., ii, 568.
 action of the electric discharge on dry and moist (BRASSON), A., ii, 718.
 direct action of radium on (FERMAN), T., 132; P., 7.
 distribution of, between water and chloroform (HALL and FEILD), A., ii, 591.
 sulphuric acid and water, equilibrium in the system (VAN DORP), A., ii, 379.
 zinc nitrate and water, equilibrium in the system (STANKOVICH), A., ii, 478.
 vapour pressures of aqueous solutions of (HERZEN), A., ii, 390.
 solubility of, in water (BRICHANX), A., ii, 390.
 aqueous, velocity of solution of metallic copper in (YAMASAKI), A., ii, 383.
 solubility of cuprous oxide in aqueous solutions of (DOSSAN and THOMAS), T., 1788; P., 213.
 hemolysis by (STADLER and KLESMAN), A., ii, 996.
 disappearance of, in the blood (MEDVEGEFF), A., ii, 739.
 in flames (REIS), A., ii, 483.
 formation in soils (LIPMAN, BROWN, and OWEN), A., ii, 649.
 compounds of organic salts of bivalent metals with (GRUBMANN and JAGER), A., i, 944.
 liquid, action of, on hydrazine salts (BROWNE and WELSH), A., ii, 1084; (BROWNE and HOULIHAN), A., ii, 1085.
 compounds of, with stannous chloride (SOFIANIDPOULOS), A., ii, 403.
 action of, on sugar solutions (JOLLES), A., i, 421.

- Ammonia**, action of, on sulphur dioxide (EPRHAIN and PIOTROWSKI), A., ii, 274.
 amount of, in normal urine (TAYLOR), A., ii, 415.
 excretion of, in urine (GAMMELTOFT), A., ii, 1115.
 estimation of, in small quantities (ARTMANN), A., ii, 226.
 free, estimation of, volumetrically (THOMLINSON), A., ii, 151.
 estimation of, in urine (STREL), A., ii, 69; (FOLIN), A., ii, 331.
 estimation of, in water (SUFFLE), A., ii, 940.
 separation and estimation of, and pyridine (DELEPINE and SORNET), A., ii, 827.
Ammonias, substituted, metallic compounds of (LANG), P., 140.
Ammonium electrode. See Electrode under Electrochemistry.
 solutions, studies of (SLADE), T., 1974; P., 242.
Ammonium salts, preparation of, from aluminium compounds with nitrogen (BADISCHE ANILIN- & SODA-FABRIK), A., ii, 1038.
 hydrolytic dissociation of (SMITH), A., ii, 393.
Ammonium carbonate, estimation of, volumetrically (THOMLINSON), A., ii, 151.
 dysprosium carbonate (JANTSCH and OHL), A., ii, 492.
 chloride, piezo-optical properties of (KREUTZ), A., ii, 352.
 lead chloride and water, the system (BRONSTED), A., ii, 381.
 sublimation of (WEGSCHEIDER), A., ii, 16.
 cyanate, transformation of, into carbamide (CHATTAWAY), P., 280.
 hydroxides, quaternary, decomposition of (V. BRAUN), A., i, 610.
 neodymo-, praseodymo- and samaromolybdates (BARBIERI), A., ii, 291.
 trinitride, action of, on metals (BROWN and HOLLEMAN), A., ii, 1085.
 nitrite, preparation of (NEOGI and ADHICARY), T., 116.
 rhodobromide (GOLOUBKINE), A., ii, 45.
 selenate, preparation of (MATHERS and BONNIB), A., ii, 603.
 sulphate, instability of (SMITH), A., ii, 393.
 density of solutions of (WIENER), A., ii, 394; (DEKUTZEN), A., ii, 603.
 estimation of (BLAIR), A., ii, 534.
Ammonium, sulphide, detection of, in wine (GALZETTI and BARTI), A., ii, 150.
Diammonium compounds, asymmetric resolution of (FÄHGLICH), A., i, 461.
Ammonium organic compounds, aromatic sulphonated, preparation of (BADISCHE ANILIN- & SODA-FABRIK), A., i, 627.
 quaternary, fission of, by reduction (EMDE and SCHELLBACH), A., i, 281.
 kinetics of (V. HALBAN), A., i, 852.
 aromatic, cryoscopic behaviour of, in bromoform (WEDERIND and PASCHKE), A., ii, 1060.
 rate of decomposition of (WEDERIND, PASCHKE, and MAYER), A., i, 628.
 asymmetric (MELDOLA and KONTZEN), T., 1283, 2034; P., 157, 263.
 thiocyanate, electrical conductivity of the system ferric chloride and (BONGIOVANNI), A., ii, 1052.
Ammonium organic halides, molecular state of, in non-dissociating media (LIANTZSCH and HOFMANN), A., i, 608.
 titanium formate (STABLER and BACHMAN), A., ii, 1097.
Ammonium carnallite (BILTZ and MARCUS), A., ii, 799.
 ψ -**Ammonium base** from pyridine and its ethyl and methyl alcoholates (KONIG), A., i, 485.
Ammonium bases, primary, secondary and tertiary, preparation of the nitrites of (NEOGI), P., 242.
Ammonium bases, cyclic (DECKER and KAUFMANN), A., i, 1023.
 quaternary, crystallography of the platinum- and stannic-salts of (RIEDEL), A., i, 953.
 ψ -**Ammonium bases**, constitution of (KAUFMANN and STRUBIN), A., i, 321; (DECKER and KAUFMANN), A., i, 807.
Amorphous and crystalline states (DOELTER), A., ii, 376.
Amygdalin, hydrolysis of, by emulsin (ROSENTHALER), A., i, 99.
Amyl nitrite, nitro- (V. BRAUN and SOBECKI), A., i, 831.
 isoAmyl nitrite, action of, on amines and amides (SMIRNOFF), A., i, 427.
 iso-Amylacetone. See β -Methylheptan-4-one.
Amylamine, α -hydroxy-, and its derivatives (V. BRAUN and SOBECKI), A., i, 831.

- Anyline** (SWERMAN and SCHLESINGER), A., i, 337.
- Anylopectin**, characteristic properties of (GATIN-GRZIEWSKA), A., i, 357.
- Anyline**, characteristic properties of (GATIN-GRZIEWSKA), A., i, 357.
- Anylopropylcarbinol**, rotation of (PICKARD and KENTON), P., 324.
- Anylopyridinium salts** (DECKER, KAPPMANN, SASSU, and WISLOKI), A., i, 1024.
- Anylo-3-pyridone** (DECKER, KAPPMANN, SASSU, and WISLOKI), A., i, 1024.
- Anytrimethylammonium**, amino, hydroxide, and its salts (v. BRAUN), A., i, 613.
- Anaesthesia** (BRITISH ASSOCIATION REPORTS), A., ii, 814.
- action of, on oenosis in plants** (LEPESCHKIN), A., ii, 919.
- local** (EACH), A., ii, 136.
- and narcotics** (GROS and HARTMAN), A., ii, 136.
- effect of, on nerve** (SYMES and VELEY), A., ii, 508.
- detection of** (HANKIN), A., ii, 162.
- anaesthesia from Brodtop** (BRODSTRÖM), A., ii, 190.
- analysis**, increased accuracy and speed in (RIMSDALE and RIMSDALE), A., ii, 1133.
- of binary compounds by means of the law of mass action** (OSTROMISSENSKY), A., ii, 195, 476; (RIFF), A., ii, 264.
- of gases**. See Gas analysis.
- capillary** (TAUBER), A., ii, 328.
- of colloidal solutions** (SAHLBOM), A., ii, 100; (FICHTER and SAHLBOM), A., ii, 259.
- electrolytic** (BRITISH ASSOCIATION REPORTS), A., ii, 824; (BENNER and HARTMANN), A., ii, 148; (PRICE and HYDE), A., ii, 539; (FISCHER, THIELE, and STECHER), A., ii, 1129; (BRUNCK), A., ii, 1136.
- apparatus for** (BAUMANN), A., ii, 925.
- elementary organic** (KURTENACKER), A., ii, 823; (AUZIER), A., ii, 928.
- gravimetric simplified** (PALOMA), A., ii, 331.
- volumetric, use of sulphur dioxide in** (ELVOVA), A., ii, 748.
- microscopic, sedimentation tube for** (SCHWABE), A., ii, 651.
- qualitative, without using hydrogen sulphide** (EBLER), A., ii, 932.
- without hydrogen or ammonium sulphides** (PAMFIL), A., ii, 1030; (ROCHE), A., ii, 1031.
- Analysis**, thermal, of binary mixtures of metallic chlorides (MENGE), A., ii, 982; (SANTONKINI and SCARPA), A., ii, 984.
- toxicological, estimation of arsenic in** (NEY), A., ii, 932.
- volumetric, with small quantities of liquid** (PILCH), A., ii, 223.
- physical chemical volumetric** (DITTOIT and V. WEISSE), A., ii, 1129, 1130, 1137.
- Anaphylaxis**, gaseous metabolism in (LOUNING), A., ii, 993.
- Andromedotoxin**, detection of, in *Ericaceae* (TUNMANN), A., ii, 1023.
- Anethole**, dehydration of the glycol of (FAGINI), A., i, 779.
- Anethole glycol**, dehydration of (BAL-PLANC), A., i, 987.
- Angelica root oil**, constituents of (ROCKE and HAHN), A., i, 513.
- Anglesite**, synthesis of (FROIT), A., ii, 502.
- Angostura alkaloids** (TROGER and KUNZE), A., i, 482.
- Anhydrides**, acid, action of alkyl halides on (VASINA), A., i, 416.
- action of, on the sodium derivative of phenylacetamide** (BODKOTX), A., i, 545.
- acrobatic iron reaction for** (BARDACH), A., ii, 826.
- Anhydroanthraquinone 9 hydrazono-1-carboxylic acid**. See Hydrazonanthraquinone.
- N-Anhydrobenzoylamino lauronic acid** (WELT), T., 1276; P., 154.
- N-Anhydrocarboxymethylamino lauronic acid** (WELT), T., 1274; P., 154.
- Anhydrocotarnine 5 aminophthalide and its derivatives** (HOPE and ROBINSON), T., 1159.
- Anhydrocotarnine 5 hydrazinophthalide and its benzylidene derivative** (HOPE and ROBINSON), T., 1162.
- Anhydrocotarnine 5 iodophthalide and its salts** (HOPE and ROBINSON), T., 1161.
- Anhydrocotarnine 2,4 dinitrophenyl-acetic acid, methyl ester** (HOPE and ROBINSON), T., 2132.
- Anhydrocotarnine nitroethane methiodide** (HOPE and ROBINSON), T., 2122.
- Anhydrocotarnine nitromethane and its picrate and methiodide** (HOPE and ROBINSON), T., 2119.
- Anhydrocotarnine 3-nitrophthalide and its salts** (HOPE and ROBINSON), T., 1158.
- Anhydrocotarnine 2- and 4-nitroethanecarboxylic acid** (HOPE and ROBINSON), T., 2123, 2124.

- Anhydroacetarnine-2,4- and 2,6-dinitro-**
toluene and their salts (HOPE and
ROBINSON), T., 2126; 2128.
- Anhydroacetarnine-2,4,6-trinitrotoluene**
(HOPE and ROBINSON), T., 2133.
- Anhydroacetarnine-*o*-nitro-*p*-toluic acid,**
methyl ester (HOPE and ROBINSON),
T., 2125.
- Anhydroacetarnineophthalide,** synthesis
of, and its salts (HOPE and ROBINSON),
T., 1163; P., 125.
- Anhydrodiphenylglycolylphenylhydr-**
oxylamine (STAUDINGER and JELA-
GIN), A., i, 216.
- Anhydroitaligenin** (KRAFT), A., i, 731.
- Anhydroitalin** (KRAFT), A., i, 731.
- Anhydrohydrastininonitromethane** and
its picrate (HOPE and ROBINSON), T.,
2138.
- Anhydrohydrastinine-2,4-dinitrotolu-**
ene (HOPE and ROBINSON), T., 2137.
- N*-Anhydromethylaminolauronic acid**
(WEIR), T., 1274; P., 154.
- Anhydromethylene-3,4-dichlorophenyl-**
glycine-2-carboxylic acid (BADISCHE
ANILIN- & SODA-FABRIK), A., i, 539.
- Anilidos,** chlorination of (ORTON and
KING), T., 1369; P., 196.
- Aniline,** absorption spectrum of, in the
ultra-violet (KOCH), A., ii, 786.
and its homologues, cause of the red
coloration of (GIBBS), A., i, 534.
solubility of, in aqueous solutions of
its hydrochloride (SIDGWICK, PICK-
FORD, and WILSDON), T., 1122; P.,
127.
effect of heat on a mixture of benz-
aldehydecyanohydrin and (EVEREST
and McCOMBIE), T., 1752; P., 218.
nitration of (HOLLEMAN, HART-
TIGS, and VAN DER LINDEN), A., i,
364.
oxidation of (MAJIMA), A., i, 216;
(MAJIMA and AOKI), A., i, 992.
condensation product of, with anthr-
anil (HELLER and GRUNTAL), A.,
i, 275.
and *p*-chloro-, compounds of, with
antimony trichloride (MAY), T.,
1884; P., 125.
compound of, with zinc chloride
(HODGES), A., i, 191.
salts of (HILDITCH), T., 238.
hydrochloride, conductivity and vis-
cosity of aqueous solutions of (SIN-
GWICK and WILSDON), T., 1118; P.,
127.
- Aniline,** dichloro-, diazo-compound,
coupling of, with theophylline
(KALLER & Co.), A., i, 507.
s-trichloro-, preparation of (ORTON
and KING), T., 1192.
- Aniline,** 2,3:4,6-tetraido- (BOYLE, T.
331.
- Anilines,** chlorination of (ORTON and
KING), T., 1185; P., 139.
- Aniline black** (WILLIATYER and
WOLFF), A., i, 90, 736; (GELIN and
WOLFF), A., i, 900.
- Aniline-2-sulphinic acid,** and its
and its sodium salt (CLAASZ, A., i,
436.
- Aniline-*o*-sulphonic acid,** 2-iodo-*o*-
and *p*-nitro-, and their salts (BOYLE,
T., 329.
- Aniline-*m*-sulphonic acid,** 4,5-dichloro-
(BOYLE), T., 331.
- Anilinoacetic acid,** *o*-bromo-, and its
ethyl esters (SCHUELLER, SCHUELLER,
and GOLDBACKER), A., i, 629.
- o*-Anilinoacetophenone,** *p*-nitro-,
phenylhydrazones and semicarbazones
(BESCH and HEFFLE), A., i, 541.
- 1-Anilinoanthraquinone** and *o*- and *p*-
amino-, and their acetyl derivatives
4'-chloro-2'-nitro-, and *o*- and *p*-amino-
(ULMANN and FODORA), A., i,
467.
- 1-Anilinoanthraquinone-2-carboxyl**
chloride (BADISCHE ANILIN- & SO-
DA-FABRIK), A., i, 980.
- 1-Anilinoanthraquinone-2-carboxylic**
acid and its sodium salt, and
4'-chloro- (BADISCHE ANILIN- & SO-
DA-FABRIK), A., i, 980.
- Anilino benzophenone,** tetrahydra-
(EHRMANN), A., i, 459.
- Anilino-*p*-benzoquinonononil,** amino-, and
its sulphate and hydrochloride (MA-
JIMA), A., i, 216.
- 5-Anilino-*p*-benzoquinonononil,** 2-
amino- (MAJIMA and AOKI), A., i,
992.
- 5-Anilino-1-*p*-bromophenyl-2,3-di-**
methoxy pyrazole (MICHAELIS and AN-
HARDT), A., i, 1038.
- 5-Anilino-1-*p*-chlorophenyl-2,3-di-**
methoxy pyrazole (MICHAELIS and AN-
HARDT), A., i, 1038.
- 2'-Anilino diphenylamino,** 2,4:6,5-tetra-
nitro- (KEHRMANN and RIECK),
PUNTI), A., i, 926.
- o*-Aniline fatty acids,** mercuriated, syn-
thesis of (SCHUELLER, SCHUELLER, and
GOLDBACKER), A., i, 699.
- Anilino naphthalene,** 1-acetylamino-
o-*p*-dinitro-, and its derivatives (SCH-
UELLER and FORSTER), A., i, 754.
- 2-Anilino-*o*-naphthaquinone,** p-amino-
and its sulphate (PUMMELE and
BRASS), A., i, 654.
- 2-Anilino naphthylloxamic acid,** *p*-
nitro-, ethyl and methyl esters (SCH-
UELLER and FORSTER), A., i, 755.

- 4-Aniline-1-naphthylphenylcarbamide, *o*-dinitro-** (SACHS and FORSTER), A., i, 755.
5-Aniline-1-naphthylphenylthiocarbamide, *o*-dinitro- (SACHS and FORSTER), A., i, 755.
5-Aniline-1-naphthylsuccinamic acid, *o*-dinitro-, and its anhydride (SACHS and FORSTER), A., i, 755.
5-Aniline-1-*m*-nitrophenyl-3-methylpyrazole (MICHAELIS, GRAFF, GERING, and BOIS), A., i, 235.
Aniline-oximinocacetoneitrile (STRINKOFF and JORGENSEN), A., i, 530.
5-Aniline- γ -phenoxy- α -*p*-chlorophenylcrotonitrile (V. WALTHER and HARSCHKE), A., i, 238.
7-Anilinosphenoxypentanol and its picrate (LES ETABLISSEMENTS POTIENS FRERES and FOURNEAU), A., i, 291.
4-Aniline- ϵ -phenylhydrazinepiperylene, *m*-chloro- (KONIG), A., i, 455.
4-Anilinosphenylimino-3-phenylim-oxazolone (MEYER), A., i, 687.
5-Aniline-1-phenyl-3-methylpyrazole. See 5-Anilo-1-phenyl-3-methylpyrazolone.
Anilino-9-phenylxanthenyl, 3:6-di-*p*-amino-, and 3:6-di-*p*-hydroxy-, chlorides (FORZ and HOWARD), T., 553.
6-Aniline-1-propylideneaminonaphthalene, *o*-dinitro- (SACHS and FORSTER), A., i, 755.
Anilino- $\alpha\beta\beta$ -tetraphenylpropioic acid, β -lactam of (STAUDINGER and JELAGIN), A., i, 215.
Anilino-1-*p*-tolyl-3-methylpyrazole, 5-acetyl and 5-benzoyl derivatives (MICHAELIS and RISSE), A., i, 1037.
Anilinetriphenylmethane-4-carboxylic acid (STAUDINGER and CLARK), A., i, 638.
1:5-*ortho*-Anilo-1- α -, and *p*-azophenyl 2:3-dimethylpyrazole (α - and *para*-*ortho*-pyrine) (MICHAELIS, GRAFF, GERING, and BOIS), A., i, 235.
5-Anilo-1-*p*-bromophenyl-3-methylpyrazolone (MICHAELIS and ISERT), A., i, 1037.
5-Anilo-1-bromophenyl-3-methylpyrazolone, 4:5-di-bromo- (MICHAELIS and THOMAS), A., i, 1038.
5-Anilo-1-*p*-chlorophenyl-3-methylpyrazolone (MICHAELIS and ISERT), A., i, 1037.
5-Anilo-1-phenyl-4-anisylidene-3-methylpyrazolone (MICHAELIS and RISSE), A., i, 1038.
1-Anilo-1-phenyl-4-benzylidene-3-methylpyrazolone (MICHAELIS and RISSE), A., i, 1038.
1-Anilo-1-phenyl-2:3-dimethylpyrazole, *p*-bromo-, and *p*-chloro-, and their salts (MICHAELIS, THOMAS, and ISERT), A., i, 1042.
2:5-Anilo-1-phenyl-2:3-dimethylpyrazole (*ortho*-pyrine), amino-, azo-, and nitro-derivatives of, and their salts (MICHAELIS, GRAFF, GERING, and BOIS), A., i, 235.
2:5-Anilo-1-phenyl-2:3-dimethylpyrazolone, and *p*-amino-, *o*- and *p*-nitro-, and their salts and derivatives (MICHAELIS, WERT and DORFMANN), A., i, 1040.
***o*- and *p*-bromo-, *p*-chloro-, *ortho*-di-chloro-, and their salts and derivatives** (MICHAELIS, THOMAS, and ISERT), A., i, 1042.
2:5 Anilo 1 phenyl 2 ethylpyrazole and its salts (MICHAELIS and WALTER), A., i, 1040.
2:5 Anilo 1 phenyl 2 methylpyrazola and its salts (MICHAELIS and WALTER), A., i, 1040.
5 Anilo 1 phenyl 3 methylpyrazolone and its salts, and 4-amino-, 5-bromo-, 5-nitro-, and 4-oximino-, and their derivatives (MICHAELIS), A., i, 1037.
2:5 Anilo 1 phenyl 2 propylpyrazola and its salts (MICHAELIS and WALTER), A., i, 1040.
6-Anilo 1 phenylpyrazolone and derivatives and 4-oximino- (MICHAELIS and WALTER), A., i, 1038.
Aolopyrine. See 2:5-*ortho*-Anilo-1-phenyl-2:3-dimethylpyrazole.
4-Aolopyrine, *p*-nitro- (MICHAELIS, GRAFF, GERING, and BOIS), A., i, 236.
2:5-Anilo-1- α - and *p*-tolyl-2:3-dimethylpyrazoles and their salts (MICHAELIS and MENDEL), A., i, 1043.
5 Anilo 1 α - and *p*-tolyl 3-methylpyrazolone (MICHAELIS and RISSE), A., i, 1039.
Anils. Schiff's bases, isomerism of (MAGGIORI), A., i, 36.
Animal fluids, chemico-physical studies of (QUAGLIARIELLO), A., ii, 962, 1114.
estimation of acetone in (SCOTT-WILSON), A., ii, 776.
estimation of iodine in (BERNIER and FEROY), A., ii, 926.
proteins, action of, on vegetarians (ALBERTONI and ROSSI), A., ii, 411.
spinal, action of asphyxia on the (MATHISON), A., ii, 128.
tissues, action of trypsin on oxidation in (BATELLI and STRON), A., ii, 508.
oxidation of isolated (HARDEN and RUSSEL), A., i, 1032.

- Animal fluids**, oxidation of succinic acid by (BATELLI and STERN), A., ii, 132.
 estimation of cholesterol in (LAPWORTH), A., ii, 305.
 estimation of oxydase in (VERNON), A., ii, 750.
- Animals**, increase of protein during the fattening of (PREIFFER and FRINKE), A., ii, 304.
 cold-blooded, pancreatic diabetes in (DIAMARE), A., ii, 1117.
- Alisaldehde**, electrolytic reduction of (TAFEL and SCHERER), A., i, 784.
 action of, on the sodium derivative of phenylacetone (BODROUX), A., i, 735.
 p-nitrophenylhydrazine (CICSA and VECCHIOTTI), A., i, 511.
 brucine sulphite (MAYER), A., ii, 223.
- Alisaldehde-p-methoxyphenylhydrazones** (PADOA and SANTI), A., i, 1029.
- Alis-ryaldoxime**, transformation of in various solvents (PATTERSON and MONTGOMERIE), P., 276.
- Alisole acid**, dithio- (*p-methoxyphenyl-carbathionie acid*), and its salts and esters (BLOCH, HOHN, and BRÜGE), A., i, 46; (HOHN and BLOCH), A., i, 49.
- o-Anisidine**, 5-chloro- (ORTON and KING), T., 1189.
 m- and p-nitro-, separation of (CHEMISCHE FABRIK GRIENHEIM-ELEKTRO), A., i, 125.
- o-o-Anisidinosacetophenone** and its phenylhydrazone and semicarbazone (BUSCH and HEFELE), A., i, 583.
- o-p-Anisidinosacetophenone** and its derivatives (BUSCH and HEFELE), A., i, 584.
- β-Anisil-β-naphthylsazone** (PADOA and SANTI), A., i, 694.
- β-Anisil-α-m-** and **p-tolylsazone** (PADOA and SANTI), A., i, 694.
- Anisole**, o-isole-, behaviour of, in the organism (LUZZATO and SATTA), A., ii, 1015.
- o-Anisylcinnamamide** (STOKER, FRIDERICI, BRAUTIGAM, and NECKEL), A., i, 297.
- o-Anisylcinnamylamide** (STOKER, FRIDERICI, BRAUTIGAM, and NECKEL), A., i, 297.
- o-Anisylcinnamanilide** (STOKER, FRIDERICI, BRAUTIGAM, and NECKEL), A., i, 297.
- o-Anisylcinnambenzylamide** (STOKER, FRIDERICI, BRAUTIGAM, and NECKEL), A., i, 297.
- o-Anisylcinnam-methylamide** (STOKER, FRIDERICI, BRAUTIGAM, and NECKEL), A., i, 297.
- 1-p-Anisyl-2,3-dimethylbenzimidazole**, chloride, 4,7-dinitro-6-hydroxy- (MELDOLA and KUNTZEN), T., 2040.
- 1-p-Anisyl-2,3-dimethyl-3-benzimidazole**, 4,7-dinitro-6-hydroxy- (MELDOLA and KUNTZEN), T., 2040.
- 1-p-Anisyl-2,3-dimethyl-6-benzimidazole**, 4,7-dinitro- (MELDOLA and KUNTZEN), T., 2039.
- o-p-Anisylhydroxystyrene** and its salts (FREUND and LEDERER), A., i, 907.
- Anisylidenecinnamylidenacetone** and p-methoxystyryl-β-styrylvinyl ketone.
- Anisylideneshydantoin** and its salts (WHEELER and HOFFMAN), A., i, 726.
- o-Anisylidene-γ-p-methoxyphenylparacetic acid** (STORBE and BENARY), A., i, 377.
- p-Anisyl-8-methylisobutyl alcohol** (HALLER and BAUER), A., i, 726.
- p-Anisyl-α-methylisobutyric acid** (HALLER and BAUER), A., i, 726.
- p-Anisyl-α-methylisobutyramide** (HALLER and BAUER), A., i, 726.
- 2-Anisyl-4-methylcoumarone** (STORBE and DECKER), A., i, 666.
- Anisylphenetylacetone** (BISCHOFF, PAULSEN, and PERRIN), A., i, 869.
- Annual General Meeting**, T., 577; P., 77.
- Anthesterol** and its acetates and other bromo-derivatives (KLONK), A., i, 129.
- Anthocyanic pigments**, formation of (COMBES), A., ii, 1125.
- Anthracene**, derivatives and oxidation of (MEYER), A., i, 193, 196.
- Anthracene derivatives** (FABRIK FARRIKEN VORM. F. BAYER & CO.), A., i, 903.
- Anthradisoxazole** (FREUND and ACHENBACH), A., i, 70.
- Anthranil** (BAMBERGER and FODOR), A., i, 60.
 homology of, with methylaniline (SCHEIBER), A., i, 915.
 constitution of, and its condensate product with aniline (HELLER and GRUNTHAL), A., i, 275.
- Anthranilic acid**, (o-aminobenzoic acid) 4-acetylamine- (KALLÉ and CO.), A., i, 667.
- 5-bromo-** and **3,5-dibromo-** and **4-chloro-** methyl esters (FREUND), A., i, 687.
- 3,5-dibromo-**, preparation of (FRIEDMANN and KOPITSCHNIK), A., i, 292.

- Anthranilic acid, 8-chloro-, and 8-chloro-, methyl esters** (BADISCHE ANILIN- & SODA-FABRIK), A., i, 539.
- Anthranilic acids, secondary, formation of red substances from the nitroso-derivatives of** (HOUBEN and ARENDT), A., i, 128.
- Anthranol** (MEYER), A., i, 194.
- Anthranoyl dibromocanthranilic acid, dibromo-, O-anhydride** (ULLMANN and KOPITSCHNI), A., i, 293.
- Anthrapyrimidone, 4-amino-** (FARBENFABRIKEN VORM. F. BAYER & CO.), A., i, 167.
- Anthraquinol (acanthranol) and its di-benzosols** (MEYER), A., i, 194.
- Anthraquinolinequinone (2:3-pyridine-anthraquinone)** (BALLY, SCHOLL, and LENTZ), A., i, 377.
- Anthraquinone and ethyl ether, the system** (SMITH and TREUB), A., ii, 871.
- condensation of, with phenols (SCHARWIK, KUNZSOFF, NAIMOFF, GANDUKIN, BERNKOFF, and DMITRIEFF), A., i, 655.
- preparation of halogen derivatives of (BADISCHE ANILIN- & SODA-FABRIK : FARBENFABRIKEN VORM. F. BAYER & CO.), A., i, 466.
- derivatives, preparation of (FARBENFABRIKEN VORM. F. BAYER & CO.), A., i, 884, 1026.
- quinonoid properties of (SCHOLL and V. WOŁODKOWITSCH), A., i, 888.
- use of, as mordant dyes (V. GEORGIEVICA), A., i, 546.
- Anthraquinone, 1-amino-** (ULLMANN and FODOR), A., i, 466.
- action of sulphuric acid and glycerol on (BALLY and SCHOLL), A., i, 676.
- 1:2-diamino-, preparation of (FARBENFABRIKEN VORM. MEINTE, LUCHS, & BRÜNING), A., i, 469.
- 4-bromo-1-amino-, benzoyl derivative (FARBENFABRIKEN VORM. F. BAYER & CO.), A., i, 469.
- 3-bromo-2-amino- (FARBENFABRIKEN VORM. F. BAYER & CO.), A., i, 995.
- 2:4-dibromo-1-amino-, acetyl derivative (FARBENFABRIKEN VORM. F. BAYER & CO.), A., i, 167.
- 1-chloro-, and 1:5-dichloro-, oximes of (FREUND and ACHENBACH), A., i, 70.
- 1:2- and 2:3-dichloro- (ULLMANN and BILLIG), A., i, 491.
- 1:3-dichloro- (BADISCHE ANILIN- & SODA-FABRIK), A., i, 466.
- 1:5- and 1:8-dichloro- (ULLMANN and KNECHT), A., i, 1010.
- Anthraquinone, 1:4:5:8-tetrachloro-, pseudo-, and hexachloro-,** (FARBENFABRIKEN VORM. F. BAYER & CO.), A., i, 466.
- oxyhydroxy-, and its acetate (V. GEORGIEVICA), A., i, 548.
- Anthraquinones, nitrogen derivatives of** (ULLMANN), A., i, 504.
- amino-, preparation of (BADISCHE ANILIN- & SODA-FABRIK), A., i, 884.
- Anthraquinone series** (ULLMANN and OCHSNER), A., i, 489; (ULLMANN and BILLIG), A., i, 490.
- Anthraquinone-1:2 acridone** (ULLMANN and SONE), A., i, 468.
- and bi-ortho- (ULLMANN and OCHSNER), A., i, 489.
- Anthraquinone-2:1 acridone, 4-amino-, and 4-chloro-** (ULLMANN and BILLIG), A., i, 491.
- Anthraquinone-1:2 acridonazine** (ULLMANN and SONE), A., i, 468.
- Anthraquinone-1 anilino- α -carboxylic acid** (ULLMANN and OCHSNER), A., i, 489.
- Anthraquinone-2 anilino- α -carboxylic acid** (ULLMANN and SONE), A., i, 468.
- Anthraquinone-1:5 bisanthranilic acid** (BADISCHE ANILIN- & SODA-FABRIK), A., i, 885.
- Anthraquinone-1:5 bis- α -thiolbenzoic acid** (BADISCHE ANILIN- & SODA-FABRIK), A., i, 885; (ULLMANN and KNECHT), A., i, 1010.
- Anthraquinone-1:8 bis- α -thiolbenzoic acid** (ULLMANN and KNECHT), A., i, 1010.
- Anthraquinone-2:1:6:5- and 2:1:7:8-bisethoxanthone** (ULLMANN and KNECHT), A., i, 1011.
- Anthraquinonecarbamide chloride, 1-amino-** (FARBENFABRIKEN VORM. F. BAYER & CO.), A., i, 167.
- Anthraquinone-2 carboxylic acid, 1-amino-** (BADISCHE ANILIN- & SODA-FABRIK), A., i, 468.
- Anthraquinone-4' chloro-1:2 dihydro-phenazine** (ULLMANN and FODOR), A., i, 468.
- Anthraquinone-2:1:6:5 diacridone** (ULLMANN and OCHSNER), A., i, 490.
- Anthraquinone-1:5 dianilino- α -carboxylic acid** (ULLMANN and OCHSNER), A., i, 490.
- Anthraquinone-1:2 dicarboxylic acid and its anhydride and imide** (SCHOLL and SCHWINGER), A., i, 995.
- Anthraquinone-2:6 dicarboxylic acid, chloride and amide of** (SEER), A., i, 386.

Anthraquinonedihomosalicylic acid, *tri-* and *hydro-bromo*, and *tri-iodo*, and their salts (CLEMMENSEN and HEITMAN), A., i, 543.

Anthraquinone-1,2-dihydro-4-methylphenazine (ULLMANN and FODOR), A., i, 463.

Anthraquinone-1,2-dihydrophenazine (ULLMANN and FODOR), A., i, 467.

Anthraquinone-1,2-phenazine (ULLMANN and FODOR), A., i, 467.

Anthraquinone-3-sulphonic acid, 1,2-diamino- (FARBWERKE VORM. MEISLER, LUCIUS, & BRUNING), A., i, 469.

Anthraquinone-1-o-thiothiobenzole acid (ULLMANN and KNECHT), A., i, 1010.

Anthraquinone-2:1-thioxanthone (ULLMANN and KNECHT), A., i, 1010.

Anthraquinoneurethane, 1-amino-, 1:4-diamino-, and 4-chloro-1-amino-, (FARBFABRIKEN VORM. F. BAYER & CO.), A., i, 167.

Anthraquinoylanthraquinone, 1:4-diamino- (ULLMANN and BILLIG), A., i, 491.

4-Anthraquinoylanthraquinone-2:1-acridone, α -amino- (ULLMANN and BILLIG), A., i, 491.

4-(3'')-Anthraquinonylbenzophenone-2'-carboxylic acid (SCHOLL and NEOVIUS), A., i, 453.

α - and β -Anthraquinonylglycine (FARBWERKE VORM. MEISLER, LUCIUS, & BRUNING), A., i, 548.

Anthraquinoxalinequinone, $\alpha\beta$ -dihydroxy- ($\alpha\beta$ -dihydroxy-1,2-pyrazineanthraquinone) and its sodium derivative and amino- $\alpha\beta$ -dihydroxy-, and nitro- $\alpha\beta$ -dihydroxy- (SCHOLL and EDLACHER), A., i, 756.

Anthraquinyl diethyl ether (MEYER), A., i, 195.

Anthraquinyl dimethyl ether (MEYER), A., i, 195.

Anthraquinyl methyl ether and its salts (MEYER), A., i, 195.

Anthrarufin dimethyl ether monoxime (FREUND and ACHENBACH), A., i, 70.

Anthratriquinonedihomosalicylic acid and its salts and derivatives (CLEMMENSEN and HEITMAN), A., i, 543.

Anthrene (MEYER), A., i, 194.

Anthroneisoxazole and 1-chloro- (FREUND and ACHENBACH), A., i, 70.

Anthroxanic acid, ethyl and methyl esters (HELLER, FRANTZ, and JÜRGENS), A., i, 864.

Anti-agglutination by bacteria (WEIL), A., ii, 619.

β -Antiarin (KILIANI), A., i, 138.

Antiarol, constitution of (THOMS and SIEBELING), A., i, 724.

Antiaris lardaria, constituents of the sap of (KILIANI), A., i, 138.

Antigen, function of the spleen in the fixation of (LUCKHARDT and HENRI), A., ii, 512.

Antimony, equilibrium of mixture of selenium with (PÉLABON), A., ii, 599.

behaviour of, in the body (CLOETTA), A., ii, 419.

action of saltwater on (BACH), A., ii, 589.

action of, on trypanosome infection (MORGENROTH and ROSENTHAL), A., ii, 632.

Antimony alloys with iron (PORTER), A., ii, 598.

with lead and tin (LOEBE), A., ii, 598.

with tin (KONSTANINOFF and SMIRNOFF), A., ii, 1096.

Antimony compounds, germicidal action of, on *Bacillus typhosus* (MORGAN and COOPER), A., ii, 519.

Antimony, tribromide and trichloride, latent heat of fusion of (TARBOCKO and MEYER), A., ii, 137.

compounds of, with benzene and with substituted benzenes (MENSCHUTKIN), A., i, 273, 274.

trichloride, equilibrium of, with pyridylbenzene (MENSCHUTKIN), A., i, 532.

compounds of, with aniline, *p*-toluidine, and *o*- and *p*-toluidines (MAY), T., 1384; P., 125.

pentachloride, double salts of, with alkaloid hydrochlorides (THOMAS), A., i, 434.

hydride, solid (RECKLEBEN and SCHEIBER), A., ii, 404.

Antimonous oxide, oxidation of (TINGLE), A., ii, 1096.

selenides, electrical resistance of (PÉLABON), A., ii, 575.

Antimony organic compounds (MAY), T., 1382; P., 124; (MORGAN and MICKLETHWAIT), T., 2286; P., 274.

Antimony, detection and estimation of small quantities of (SCHIDROWITZ and GOLDSBROUGH), A., ii, 338.

detection of, in cases of poisoning (PEDRAZZINI), A., ii, 438.

estimation of, in water (GAUTIER and MOUREU), A., ii, 301.

detection, separation and estimation of arsenic and (BRESSANIN), A., ii, 1134.

Antipepsin (DEZANI), A., ii, 621.

Antipneumin (BATELLI and STEIN), A., ii, 1008.

Anti-protease from bacteria (MEYER), A., i, 512.

- stryryne (1-phenyl-2,3-dimethylpyrrolidine), compound of, with ferric chloride (ASTAR and VIDAL), A., i, 814.
- compounds of, with tin chlorides (ASTAR and VIDAL), A., i, 399.
- fusion of, with toluenesulphonamides (YOSWINKEL), A., i, 498.
- Antipyrine, *o*- and *m*-amino-, *m*- and *p*-4-diamino-, *m*- and *p*-benzoyl-amino-, 4-bromo-*m*- and *p*-acetyl-amino-, 4-bromo-*p*-benzoylamino-, 4-bromo-*m*- and *p*-nitro-, *o*-, *m*- and *p*-nitro-, *o*-, *m*- and *p*-4-dinitro-, *m*- and *p*-nitro-, 4-nitroso-, 4-nitroso-*p*-acetylamino-, 4-nitroso-*p*-benzoylamino-, and their salts and derivatives (MICHAELIS, GRAFF, GERING, and BOLE), A., i, 233.
- influence of, on the proteins of blood-serum (CERVELLO), A., ii, 409.
- estimation of, iodometrically, in mugearina (SLEESWYK), A., ii, 80.
- antiseptics, influence of, on the antolysis of yeast (NAVARRAT), A., ii, 640.
- of urine, action of (JORDAN), A., ii, 218.
- asthrombina, hepatic, isolation and extraction of (DOYON, MOREL, and POLICARD), A., ii, 216.
- passage of the, into the blood (DOYON, MOREL, and POLICARD), A., ii, 409.
- aria, atheromatous, chemistry of the (SELIG, AMESDER, v. ZEYNEK), A., ii, 219.
- asite (CAMERON and McCATCHEY), A., ii, 734.
- artificial, crystallography of (DE SCHULTEN), A., ii, 615.
- apsile, additive compounds of, with peryl chloride and *s*-trinitrotoluene-crystallography of (BOZENS), A., i, 290.
- aphyllite (SMITH), A., ii, 501.
- paratus for carrying out chemical reactions (SPITALSKY), A., ii, 225.
- for preserving and measuring poisonous, hygroscopic or low-boiling liquids (STEINKOFF), A., ii, 106.
- for showing the formation of nitrogen compounds from atmospheric air (VAN ERP), A., ii, 33.
- plas, constituents of (THOMAE), A., ii, 920.
- composition of seeds of (HUBER), A., ii, 1024.
- ca regia as an oxidising agent (MOORE), A., ii, 719.
- elution of gold in (PFIWOZNIK), A., ii, 484.
- granite, transformation of, into calcite (LACHTSCHENKO), A., ii, 886.
- Aragamite, colour reactions of (THOUTT), A., ii, 334.
- Aracaria cunninghamii*, constituents of (BAKER and SMITH), A., i, 479.
- Arbutin in pear-tree leaves (BOURQUELLET and FICHTENHOLZ), A., i, 503.
- in pear leaves and its function in producing autumn tints (BOURQUELLET and FICHTENHOLZ), A., ii, 143.
- detection of, in plants (TUNMANN), A., ii, 689.
- Are. See under Electrochemistry.
- Arecolina, reactions of (REICHARD), A., ii, 778.
- Arginine, degradation of, in plants (KISSEL), A., ii, 1124.
- salts of (WEISS), A., i, 667.
- uric (KOSSEL and KENNAWAY), A., i, 668.
- Argon, fractional crystallisation and atomic weight of (FISCHER and FROESE), A., ii, 202.
- spectrum of (STABLE), A., ii, 449.
- critical density and isotherms of (CHOMMELIN), A., ii, 202; (UNNEK and CHOMMELIN), A., ii, 203, 467.
- content of gases from springs (WALFEL), A., ii, 280.
- introduction to, in natural gaseous mixtures (MOHRER and LAFAYE), A., ii, 392.
- ratio of, to nitrogen, in natural gaseous mixtures (MOHRER and LAFAYE), A., ii, 602.
- Argon group, physical contents of gases of the (CHUBERTSON), A., ii, 108.
- dielectric cohesion of the gases of the (BACUS), A., ii, 458.
- viscosity of gases of the (REINHARDT), A., ii, 558.
- gases of the, relation between atomic weight and viscosity for (RANKINE), A., ii, 87.
- Arabin-hexa*, sucrose in the roots of (LESKEA), A., ii, 525.
- Aromatic compounds, reduction of, by Sabatier's method (SKITA and RITTER), A., i, 272.
- introduction of phthalic acid groups into (SCHOLL and SEER), A., i, 557; (SCHOLL and NIEWIARSKI), A., i, 567.
- relation of the velocity of chlorination of, to constitution (ORTON and KING), T., 1369, 1377; P., 196.
- as chelagogues (PETROWA), A., ii, 1010.
- solid, emission spectra of (GOLDSTEIN), A., ii, 560.
- Arsanilic acid. See Phenylarsinic acid, *p*-amino.

Arsenic in marine algae (TASSELLY and (LEBOINE), A., ii, 142.

allotropic modifications of (JOLIBOIS), A., ii, 720.

adsorption of, by aluminium hydroxide (LOCKEMANN and PACKEB), A., ii, 730.

absorption of, by beetroot (REMMER), A., ii, 919.

adsorption of, by ferric hydroxide (LOCKEMANN), A., ii, 495.

compounds of, with manganese (ARIVACT), A., ii, 399.

compounds of, with tin (JOLIBOIS and DUPUY), A., ii, 612; (FARRAVANO and DE CESARIS), A., ii, 613.

action of, on red blood corpuscles (ONAKA), A., ii, 212.

excretion of, in urine, after use of dihydroxydiaminoarsenobenzene (GREVEN), A., ii, 511.

Arsenic alloys with mercury, preparation of (DUMENIL), A., ii, 493.

Arsenic compounds, germicidal action of, on *Bacillus typhosus* (MORGAN and COOPER), A., ii, 519.

influence of, on the fermentation of sugars by yeast (HARDEN and YOUNG), A., ii, 519.

toxicity of (LACNOY), A., ii, 69.

trichloride, latent heat of fusion of (TOLEDOCKO and MEYER), A., ii, 187.

hydride, solid, composition of (HECKLEBEN and SCHNEIDER), A., ii, 390.

Arsenious oxide, oxidation of (TINGLE), A., ii, 1086.

Arsenic acid, hydrates of (BALAREFF), A., ii, 798.

Arsenides, preparation of (HILPERT and DIECKMANN), A., ii, 985.

Arsenic, detection of, in cases of poisoning (PEDRAZZINI), A., ii, 438.

detection and estimation of, in organic compounds (BRESSANIN), A., ii, 1133.

detection, separation, and estimation of, and antimony (BRESSANIN), A., ii, 1134.

detection and separation of (SAL-KOWSKI), A., ii, 153.

estimation of, in arsenical greens (HEIDUSCHKA and REUSS), A., ii, 438.

estimation of, in mineral waters (AGENO and GUICCIARDINI), A., ii, 769.

estimation of, in organic substances (LOCKEMANN), A., ii, 1026.

estimation of, in pyrites (HATTENSAUR), A., ii, 1028.

estimation of, in toxicological analysis (NEW), A., ii, 932.

Arsenic, estimation of, in urine (RAT-UCHKA and BRUCHT), A., ii, 527.

Arsenides. See under Arsenum.

Arsenobenzene, *pp*-diamino-, and its salts (KHALICH, BREKHEM, and SCHMITZ), A., i, 594.

diaminodihydroxy-, excretion of, in urine after the use of (LEBENZ), A., ii, 511.

detection of (ABELIN), A., ii, 499.

hydrochloride. See Salvarsan.

Arsenomolybdic acid, guanidinium salt of (ROMENHEIM and PINSKER), A., ii, 266.

Arsenophenols, tetrabromo-, tribromo-, and tetraiodo- (FARRAVANO, MEISTER, LUCIUS, & BRUNING), A., ii, 1055.

Arsenophenylglycine, action of, in trypanosome infections in mice (BROWNING and MCKENZIE), A., ii, 59, 219.

Artemisininphenylhydrazones (BARTON), A., i, 898.

Arteries, fat in the coats of (KROEMER and MANNING), A., ii, 1112.

surviving, reactions of (COW), A., ii, 413.

Arylamines, synthesis of (MARTIN and MEHAT), A., i, 535.

Arylarsonic acids, nitrohydroxy-, preparation of (FARRAVANO, MEISTER, LUCIUS, & BRUNING), A., ii, 1055.

Aryloxacetonedicarboxylic acid, esters, and their condensation products with hydrazines (BULOW and GALT), A., i, 1943.

Arylnitrosohydroxylamines, relation between bisnitroso-compounds and (BAMBERGER), A., i, 996.

Arylanilphodiazolimine-derivatives, preparation of (ARTEN-GEFFELS and FUR ANILIN-FABRIKATION), A., ii, 509.

Arylsulphon-amides, and *pn*-naphthylides, amino-derivatives of (MILLER and MICKLETHWAITE), A., ii, 326.

Arylsulphonyl chlorides, action of, on alcohol on (GOSBAUM), A., i, 483.

Arylxantheneols, hydroxy-, action of, on halogen acids on (GOSBAUM and WEST), A., i, 737.

***Asarum europaeum*, presence of arsenic in the roots of** (LESTER), A., ii, 525.

Asbestos, use of, in the filtration of permanganate (TSCHERNING), A., ii, 43.

Ascaridole glycol, and its benzene (NELSON), A., i, 797.

***Ascaris tumbricoides*, a glucose poison in** (MCCRUDEN), A., ii, 415.

- Amides, chylous and pseudo-chylous** (WALLIS and SCHÖLKE), A., ii, 512.
- Asiatic acid** (MASON), A., ii, 761.
- Asiaticum venetorum***, composition of the root of (MASON), A., ii, 761.
- Aspidians' blood**. See Blood.
- Ash, analysis of** (STOLTE), A., ii, 946.
- Accurate estimation of**, from vegetable and animal matter (FLEURENT), A., ii, 445.
- Asparagine**, use of, in the production of milk (MORON, BEYER, and WESTMÄSSER), A., ii, 751.
- Complex chromium**, derivative of (SCHUGARFF and SERBIN), A., i, 116.
- Asparagine-dithiocarboxylic acid**, benzyl hydrogen ester of, and its barium salt (SIEGFRIED and WEIDENHAUPT), A., i, 117.
- Asparagus**, constituents of the roots of (MORSE), A., ii, 524.
- Aspartic acid**, action of putrefactive bacteria on (ACKERMANN), A., ii, 757.
- Aspergillus niger***, influence of manganese on the development of (BERTRAND and JAVILLIER), A., ii, 222.
- Influence of zinc and manganese on the development of** (BERTRAND and JAVILLIER), A., ii, 421, 444.
- Utilisation of aucubin by** (HERINSEY and LERAS), A., ii, 759.
- Assimilation of phosphorus by** (DOX), A., ii, 914.
- Insulinase in** (BOSELLI), A., ii, 1022.
- Aphyxia**, action of, on the spinal animal (MATHISON), A., ii, 123.
- Effect of**, on the vaso-motor centre (MATHISON), A., ii, 617.
- Assimilation of plants**. See Plant assimilation.
- Arter, woody**, chemical examination of (RAIFORD), A., ii, 820.
- Asymmetry in the supposed absence of an asymmetric atom** (MARSH), P., 317.
- Atacamite** (UNGEMACH), A., ii, 1100.
- Atmosphere**, constituents of the upper layers of the (WEGENER), A., i, 271, 387.
- Estimation of the degree of vitiation in an** (HENRIET and BOUSSY), A., ii, 532.
- Atmospheric air**, linespectrum of (HEM-SALECH), A., ii, 449, 558.
- Ultra-violet spark spectrum of** (WAGNER), A., ii, 829.
- Ionisation of** (EYE), A., ii, 89.
- Radioactivity of**, over the sea (RUNGE), A., ii, 1060.
- Mineral constituents of the dust in** (HARTLEY), A., ii, 558.
- C. ii.
- Atmospheric air**, amount of carbon dioxide in, at Monte Video (SCHWEDDER), A., ii, 1086.
- Apparatus for showing the formation of nitrogen compounds from** (VAN ERP), A., ii, 35.
- Formation of oxidising agents in**, by means of ultra-violet light (CHLORIN), A., ii, 717.
- Expired, amount of carbon dioxide in**, in town and country (THOMSON), A., ii, 408.
- Protein, cleavage products in** (WEICHAERT), A., ii, 993.
- Liquid and solid, apparatus for the preparation of small quantities of** (HAMBERGER), A., ii, 106.

B.

- Babodanite**, a variety of helectite, from Mysore (SMITH), A., ii, 737.
- Babodanite**, analysis of (WALKER and WHITMAN), A., ii, 442.
- Babodanite**, formation of dextrans from starch by (SCHARDINGER), A., i, 181.
- Babodanite**, production of acid and alkali by (JANUSZKIS), A., ii, 139.
- Babodanite**, action of, on nitrates and nitrites (LOUIE), A., ii, 1121.
- Babodanite**, the *Prokus* group, carbohydrate metabolism of (GLENN), A., ii, 639.
- Babodanite**, proteolytic power of (BIELECKI), A., ii, 758.
- Babodanite**, lactic acid produced by (FERRER), A., ii, 1018.
- Babodanite**, fermentation of formic acid by FRANZEN and GREYER, A., ii, 59.
- Babodanite**, action of, on sugars (WALDRIE), A., ii, 319.
- Babodanite**, differentiation of (BEATY and YATES), A., ii, 1019, 1122.
- Babodanite**, germicidal action of arsenic and antimony compounds on (MORGAN and COOPER), A., ii, 519.
- Babodanite**, action of alcohols on (BOESKY), A., ii, 522.
- Babodanite**, agglutination by (WALL), A., ii, 619.
- Babodanite**, action of, on aspartic acid (ACKERMANN), A., ii, 757.
- Babodanite**, splitting by (SOHNGEN), A., ii, 319.
- Babodanite**, reduction of lipase by (SOHNGEN), A., ii, 639.

- Bacteria**, changes produced in milk by (SCHOLBERG and WALLIS), A., ii, 512.
- Bacteria**, reduction of nitrates to nitrites by (FELT), A., ii, 139.
- Bacteria**, nitrogen metabolism by (BOHNER), A., ii, 648.
- Bacteria**, pigments from oxidation by (REYER-THOMAS), A., ii, 518.
- Bacteria**, oxidation of phenol by (FOWLER, ARFELS, and LACKER), A., ii, 139.
- Bacteria**, action of, on proteins (RAINSBROOK), A., ii, 1121.
- Bacteria**, splitting of the pyrimidine ring by (ACKERMANN), A., i, 508.
- Bacteria**, proteases and anti-proteases from (MITSURU), A., i, 511, 512.
- Bacteria**, influence of strychnine on (SADIKOFF), A., ii, 1019.
- Bacteria**, nitrogen in soils (EMMERICH, LEISINGER, and LOEW), A., ii, 480.
- Bacteria**, decomposition of sugars by (MENDLER), A., ii, 318.
- Bacteria**, thermophilic, assimilation of atmospheric nitrogen by (FRINGSMEIER), A., ii, 510.
- Bacteria**, water decomposition by (SPAT), A., ii, 1121.
- Bacteria**, formation of trimethylamine by (ACKERMANN and SCHULTZ), A., ii, 61.
- Bacteria**, formation of *d*-gluconic acid by (MISLER), A., ii, 317.
- Bacteria**, See also: Fermentation, and Yeast.
- Balance Sheets** of the Chemical Society and of the Research Fund. See Annual General Meeting, T., 577; P., 77.
- Balanophorin** (SEYM), A., i, 391.
- Bamboo** sheds, components of (TOJANI), A., ii, 222.
- Bamboo**, content and distribution of hydrocyanic acid in the (WALLER, KRASNOSELSKY, MAKIMOFF, and MALOSHIWSKY), A., ii, 325.
- Bananas**, composition of (YOSHIMURA), A., ii, 526.
- Barbituric acid**, preparation of alkylthio-derivatives of (MPLER), A., i, 693.
- Barium** in soils (FALLBERG), A., ii, 146.
- Barium**, action of, on the heart (ROTHBERGER and WINTERBERG; WER-SCHINS), A., ii, 1117.
- Barium**, monohydrate of (KIRSCHNER), A., ii, 396.
- Barium**, action of, on dextrose and galactose (Hirson), A., i, 423.
- Barium**, orthothioarsinate (GLATZEL), A., ii, 980.
- Barium**, orthothioarsenate (GLATZEL), A., ii, 282.

- Barium oxide**, as a reducing agent (ZERNWITZOFF and V. OSTROMILSKY), A., i, 849.
- potassium orthothioarsenate** (GLATZEL), A., ii, 801.
- sodium phosphate** (QUARTAROLI), A., ii, 489.
- rhodobromide** (GOLDBERGER), A., ii, 15.
- sulphate**, artificial crystallisation of (COOPER, FULLER, and KLEIN), A., ii, 726.
- plasticity** of (ATTERBERG), A., ii, 605; (EHRENBERG), A., ii, 972.
- occlusion** in precipitates of (JOHNSTON and ADAMS), A., ii, 766.
- Barium**, detection of, strontium, calcium, and lead (BROWNSIE and BLUMENTHAL), A., ii, 1032.
- estimation** of, qualitatively (CORTMAN and FRANKEL), A., ii, 659.
- separation** and **estimation** of (BOUCH and BOYNTON), A., ii, 334.
- separation** of strontium, calcium and (HORN VAN DEN BOS), A., ii, 228; (BIRNBAUER), A., ii, 770.
- Barley**, constituents of the glumes of (GEYS), A., ii, 529.
- formation** of hordeine during the germination of (TORQUATI), A., ii, 623.
- influence** of soil on the root development of (POLLE), A., ii, 224.
- utilisation** of the proteins of (MENDEL and FINE), A., ii, 1109.
- Barytes** from the Freiberg district (HENSELRIE), A., ii, 902.
- specific heat** of (LASHITSCHENKO), A., ii, 253.
- crystallography** of (KOLB), A., ii, 295.
- artificial**, crystal forms of (GERHART), A., ii, 262.
- Base**, $C_7H_{15}N$ from ϵ -hydroxy- γ -methylhexylamine and hydrobromic acid, and its oxalate (WOLL and MAAO), A., i, 25.
- $C_{10}H_{15}N_2$ from methyl β -aminoisopropyl ketone, and its salts (GABRIEL), A., i, 213.
- $C_{11}H_{19}O_2N_2$ from 2-keto-3-methylimino-5-phenylpyrrolidine hydrochloride (MIRX and MÖSCHMEYER), A., i, 80.
- $C_{10}H_{15}N_2$ from *Withania somnifera* and its salts (POWER and SALWAY), T., 496; P., 53.
- $C_{10}H_{15}O_2N_2$ from chlorogryllone (GABRIEL), A., i, 229.
- $C_{10}H_{17}ON$ from 2-ethylquinoline (VONGERICHTEN and ROTTA), A., i, 677.
- $C_{10}H_{14}ONCl$ from 2-ethylquinoline (VONGERICHTEN and ROTTA), A., i, 677.
- Bases**, organic, compounds of, with iodocetylene (DENN), A., ii, 190.
- physiological action** of (EHRICH, KORET and JOANIN), A., ii, 190.
- action** of carbon tetrabromide on (DENN and DEWEY), A., ii, 190.
- tertiary**, action of, on sulphur bromides (WEDERKIND and S...), A., i, 190.
- cyclic**, velocity of addition of bromides to (LONG), T., 237; 283.
- weak**, polarimetric determination of avidity of (RIMBACH and ...), A., ii, 869.
- Bauxite** (GAUTIER), A., ii, 497.
- Bebearina** methiodide methyl ester (SCHOLTZ), A., i, 913.
- Beckmann rearrangement** (K... and ...), A., i, 213; (SCH...), A., i, 505; (HENRICH), A., i, 505.
- Beef**, new leucomaine from (T...), A., i, 396.
- Bear**, solubility of carbon dioxide (FINDLAY and SHEN), T., 131; 139.
- cause** of the separation of (EMSLANDER), A., i, 935.
- Bees**, mineral composition of (SOHN), A., ii, 509.
- inversion** of sucrose by (KOENIGSEDER), A., ii, 1003.
- Beetroot** (sugar), occurrence of (in the roots of) (PERKIN), A., ii, 107.
- influence** of light on the composition of (STROHMER, BREIM, and ...), A., ii, 763.
- absorption** of arsenic by (RIMBACH), A., ii, 919.
- manurial** experiments with (LARD), A., ii, 145; (GREGG), A., ii, 648.
- nitrogenous** manures for (FRACHFELD and VILKOVSKY), A., ii, 65.
- estimation** of sugar in (OHLER), A., ii, 232; (STROHMER and FALLAC), A., ii, 427.
- Behenic acid**, iodo-, guaiacol ester (FAHNFARRIKEN vorm. F. B... & Co.), A., i, 630.
- Behenolyl chloride**, di-iodo- (HOFFMAN, LA ROCHE & Co.), A., i, 691.
- Behenyl chloride**, iodo- (ABERHACH, HIRSCH, and GUGGENHEIM), A., ii, 955.
- Behenylglycine**, iodo- (ABERHACH, HIRSCH, and GUGGENHEIM), A., ii, 955.
- Belladonna**, extract of (DANAW...), A., ii, 644.
- Benzaldehyde**, solutions of, in (ROSENTHALEN), A., i, 987.

- Benzaldehyde**, and hydrocyanic acid, solutions of, in water (WIRTH), A., i, 875.
- condensation of, with α -nitrotoluene (HEIM), A., i, 717.
- sulphites of the alkaloïds (MAYER), A., i, 722.
- Benzaldehyde**, 3-chloro-2-hydroxy- (FARBENFABRIKEN VORM. F. BAYER & CO.), A., i, 459.
- α - and β -hydroxy-, action of cyanoacetic ester on (SCLAVI), A., i, 398.
- α - and β -hydroxy-, dimethyl mercaptals and acetals and α -hydroxy-, dimethyl acetal (PAULY, V. BIRTLAR, and LOCKERMANN), A., i, 786.
- α -nitro-, preparation of (SOCIÉTÉ CHIMIQUE DES USINES DU RHÔNE), A., i, 987.
- p -nitrophenylhydrazone, and α -nitro-, preparation of (HAMBERGER and FODOR), A., i, 60.
- Benzaldehydes**, separation and transformation of the (ERLENMEYER, HILGENDORFF, and MARX), A., i, 781.
- Benzaldehydecyanohydrin**, action of heat on a mixture of, and aniline (EVEREST and MCCORMIE), T., 1752; T., 218.
- Benzaldehydesem-diphenylcarbonyloxime** (DUNN), P., 239.
- Benzaldehyde- p -methoxyphenylhydrazone** (PAINO and SANI), A., i, 1629.
- Benzaldehyde- m -nitrophenylhydrazones**, α -cyano-, and α -nitro- (PONZIO), A., i, 920.
- Benzaldehyde- o - p -dinitrophenylhydrazones**, α -nitro- (PONZIO), A., i, 920.
- Benzaldehydenitroso- p -nitrophenylhydrazones**, α -amino- (PONZIO and GASTALDI), A., i, 926.
- Benzaldehydophenylhydrazones**, labile, preparation of (THOLE), P., 278.
- α -Benzaldehydophenylhydrazones, relation of, to other nitrogen compounds (CUPA and PESTALOZZA), A., i, 678.
- Benzaldehyde-2- and β -sulphonic acids**, 4-hydroxy- (FARBENFABRIKEN VORM. F. BAYER & CO.), A., i, 459.
- Benzamide**, esterification of (REIN), A., i, 199.
- Benzamide**, p -amino-, acetyl derivative (BOWERT and WISE), A., i, 46.
- 13-Benzanthraquinone**, 4-amino-, and 1- and 4-nitro- (SCHOLL and V. WOLKOWITSCH), A., i, 889.
- Benzanthrone** and its picrate and 10-dibromo- (BALLY and SCHOLL), A., i, 676.
- Benzanthrone**, reduction of (BALLY and SCHOLL), A., i, 676.
- Benz- α -butylamide** (SCHROETER), A., i, 106.
- Benzodiantrene**, 4:4'-dihydroxy-, and its dibenzoate (SCHOLL and SERR), A., i, 454.
- Benzodithiophen** and its derivatives (LAFLEY), A., i, 151.
- Benzene**, formula of (MOHR), A., i, 650; constitution of (FRY), A., i, 431; LIEBSCHITZ', A., i, 622; CHACON, A., ii, 1089.
- nucleus, orientation in the (OZAMMILLER), A., i, 960.
- structure of, and reactivity of its substituents (OBERMILLER), A., i, 963.
- interpretation of the ultra violet absorption spectrum of (FRY), A., i, 431.
- absorption of ultra-violet light by (GREEN), A., ii, 83.
- specific heat of, and of its saturated vapour (MILLS and MACRAE), A., ii, 187.
- solubility of water in (GROSCHUPP), A., ii, 505.
- action of aluminum chloride on (HOMER), A., i, 276.
- action of cyclopropanecarboxylic acid chloroanhydride on, in presence of aluminum chloride (KISNER), A., i, 959.
- compounds of, with antimony tri-bromide and trichloride (MEX-SCHULZIN), A., i, 273, 274.
- sulphation of (SCHEIDER, RECKEBEN, and STRAUSS), A., i, 189.
- and chlorine, action of sulphur monochloride on (BOESKEN and KONING), A., i, 532.
- action of sulphuric acid on p -nitrosoderivatives of (HAMBERGER and HAMB), A., i, 684.
- chain, gradual synthesis of the (HITZLER), A., i, 32.
- derivatives, absorption spectra of (CEYMBLE, STEWART, WRIGHT, and GLENDENNING), T., 451; P., 46.
- absorption spectra and constitution of (WATIANIKOFF), A., ii, 2.
- physical properties of mixtures of p -dihalogen (NAGOROFF), A., i, 27; (NAGOROFF, SCHEMERHUSCHNY, and KURNAKOFF), A., ii, 18.
- containing chlorine and bromine, absorption spectra of (PUNVIA), T., 1699; P., 218.
- containing iodine, absorption spectra of (PUNVIA), T., 2318; P., 280.
- containing oxygen, compounds of, with halogen acids (MAARS and McINTOSH), A., i, 289.

- Benzene**, estimation of the halogens in (MAYORR), A., ii, 66.
 nucleus, equivalence of positions in the (WOHL), A., i, 57.
 configuration of (VAUDEL; LIPSCHITZ), A., i, 774.
 substitution in the (HOLLEMAN), A., i, 718.
- Benzene**, bromo-, and chloro-, absorption spectra of, as vapours, liquids and in solution (PURISS), T., 811; P., 71.
p-dibromo-, condensation of, with xanthone (CONE and WEST), A., i, 805.
 chloro-, and *o*-, *m*-, and *p*-dichloro-, absorption spectra of (BALY), T., 856; P., 72.
 1-chloro-2,6-dinitro- (HORSCH and RANTSCHOFF), A., i, 329.
 nitro-, measurement of the magnetic double refraction of (COTTON and MOUTON), A., ii, 4.
 equilibrium of condensation of carbon dioxide with (KOHSTAMM and KREIDERS), A., ii, 1077.
 conductivity of solutions of aluminium bromide in (PLOTNIKOFF), A., ii, 247.
 reduction of (ZEREWITOFF and V. ONTROMISLEN-SKY), A., i, 849.
m-dinitro-, additive compounds of (VAN RUMBERGH), A., i, 622.
 2:4:6-trinitro-, preparation of (MEYER), A., i, 848.
 additive compounds of phenols and phenolic ethers with (SCUDNOROUGH and BEARDS), T., 212; P., 5.
- Benzenes**, *d*-nitro/*d*-hydroxy-, preparation of salts of the (SHAW), P., 14.
- Benzeneazo-4-amino-1:2-methylene-dioxybenzene** (MAMELI), A., i, 510.
- Benzeneazo-5-bromobenzoic acid** (FREUNDLER), A., i, 758.
- Benzeneazocarbonylcoumarone** and its silver derivative and phenylhydrazone (MERRIMAN), T., 914; P., 102.
- 2-Benzeneazo-5-chlorobenzoic acid** and its barium salt and methyl ester (FREUNDLER), A., i, 757.
- Benzeneazo-3:5-dichlorobenzoic acid** and its salts and derivatives (FREUNDLER), A., i, 577, 815.
- 4-Benzeneazo-*m*-oresol** (MCPIERSON and BOORD), A., i, 818.
- O*-Benzeneazodiacetylbenzoylmethane** (AUWERS, DANNEHL, and BOENNECKE), A., i, 172.
- 4-Benzeneazo-5-hydroxy-3-methyl-oxazole**, and its silver salt and *p*-nitro-, and 4-dinitro- (BECK and HECKING), A., i, 244.
- 4-Benzeneazo-5-hydroxy-3-methylpyrazole**, *p*-nitro-, and (BELOW and HECKING), A., i, 404.
- 4-Benzeneazo-5-hydroxy-1-phenyl-3-methylpyrazole**, benzoyl derivative of (AUWERS, DANNEHL, and BOENNECKE), A., i, 170.
p-nitro-, and *op*-dinitro- (BELOW and HECKING), A., i, 404.
- 4-Benzeneazo-5-hydroxy-1-*op*-dinitro-phenyl-3-methylpyrazole** (BELOW and HECKING), A., i, 404.
- 1-Benzeneazo-2-methoxythionaphthalene** (AUWERS and MÜLLER), A., i, 157.
- 5-Benzeneazo-4-methylamino-3:3-dimethyl-4'-azo-*p*-dimethylamino-8-disulphonic acid**, sodium salt (RASSOW and BECKER), A., i, 802.
- 5-Benzeneazo-4-methylamino-3:3-dimethyldiphenyl-4'-azo-8-naphthyl-3:8-disulphonic acid**, sodium salt (RASSOW and BECKER), A., i, 802.
- Benzeneazomorphine** (WIELAND and KAPPELMEIER), A., i, 745.
- Benzeneazo-8-naphthol**, and its salts and derivatives (CHARLIER and FERRARI), A., i, 1046.
- Benzeneazo-*o*- and 8-naphthylsulphuric acids**, salts of (VOROSCHITSOFF), A., 819.
- 3-Benzeneazo-2:5-dinitro-4-acetylazobenzene**, and its sodium salt and *p*-nitro-, and their acetyl derivatives (MELDOLA and KUNTZEN), T., 46.
- 9-Benzeneazo-10-phenanthrol**, acetate and benzoate (AUWERS, DANNEHL, and BOENNECKE), A., i, 170.
- o*-Benzeneazophenol**, synthesis of *o*-*m*-amino-*o*-hydroxy-, acetyl derivatives (VOROSCHITSOFF), A., i, 818.
- Benzeneazophenyliminophenylmethane** (BUSCH and RUFFENHAI), A., i, 170.
- 4-Benzeneazo-3-phenylloxazoline**, and *p*-nitro- (MEYER), A., i, 241.
- p*-Benzeneazoresorcinol benzoate** (KACFFMANN and KUGEL), A., 930.
- Benzeneazosalicylic acid**, *p*-amino-, and its acetyl and diazo-derivatives (BELOW and HAAS), A., i, 339.
- 4-Benzeneazo-*m*-tolyl benzoate** (MCPIERSON and BOORD), A., i, 818.
- Benzeneazo-*o*-benzoic acid** (FREUNDLER), A., i, 757.
- Benzenediazonium *o*-nitrobenzenesulphonate**, *o*-nitro- (CLAASZ), A., i, 695.
- Benzenediazosulphone** (CLAASZ), A., i, 695.

- Benzenesulphonic acid**, 1-chloro-4-nitro-, and *o*-nitro-, and its sodium salt and ethyl ester (CLAASZ), A., i, 437.
- Benzenesulphondibromamide**, action of, with sulphuric acid (KASTLER), A., i, 561.
- Benzenesulphonate**, *di-o*-nitro- (CLAASZ), A., i, 695.
- Benzenesulphonic acid**, isomorphous derivatives of (BRITISH ASSOCIATION REPORTS), A., i, 713.
- Sulphonation of** (LARK), A., i, 30.
- Acidic salts of** (SEYEWITZ and POZAT), A., i, 360.
- o*-dichloro-*o*-tolyl ester** (RASCHE), A., i, 637.
- 2,3-di-iodo**, and its salts and derivatives, and 2,3,4,5-tetra-iodo-, salts and derivatives, and 2-iodo 4-nitro-, potassium salt, and 2,3-di-iodo-5-nitro-, and its salts (BOYLE), T., 330; P., 9.
- Benzenesulphonylaminobenzonitrile** (BOCKERT and WISE), A., i, 46.
- Benzenesulphonylaminophenyl 2,3-dimethyl-5-pyrasolone**, and 4-bromo-, and 4-nitro-, (MICHAELIS, GRAVE, GRUBER, and BOLE), A., i, 233.
- Benzenesulphonylanilide**, *p*-iodo- (ZINCK and JORG), A., i, 41.
- Benzenesulphonylaniline** and its compound with stannic chloride (SEMPER), A., i, 580.
- Benzenesulphonylmorphine** and its benzenesulphonate (WIELAND and KAPPELMAYER), A., i, 746.
- Benzoic 1:2,4-tricarboxylic acid**. See Tricarballic acid.
- Benzhydrol**, *p*-amino-, compound of, with *β*-naphtholaldehyde (TORREY and PORTER), A., i, 340.
- 1,5-dibromo-4-amino**, and its action with bromine (CLARK and ESSELEN), A., i, 725.
- glydroxy**, and its penta-acetyl derivative (GROSS and BEVAN), T., 1455.
- Benzhydrol 4-azodimethylaniline** and its derivatives (TORREY and PORTER), A., i, 340.
- Benzhydrol 4-azo-*β*-naphthol** (TORREY and PORTER), A., i, 340.
- Benzhydrol ether** (WEDERIND and SCHENK), A., i, 190.
- Benzhydrylidenebenzocycloheptadiene** (STAUDINGER and KON), A., i, 879.
- Benzhydrylidenedimethylbenzocycloheptadiene** (STAUDINGER and KON), A., i, 879.
- Benzhydrylidenediphenylbenzocycloheptadiene** (STAUDINGER and KON), A., i, 879.
- o*-Benzhydrylidene-pentamethylene oxide** (STAUDINGER and KON), A., i, 879.
- o*-Benzhydrylalkylbenzenes** (GROSS and VALLETTE), A., i, 652.
- Benzidine**, quinonoid salts of (MADLUNG), A., i, 323, 678; (PICCARD), A., i, 493.
- detection of bloodstains by means of** (GIGLI), A., ii, 348.
- 2,2-dichloro-5,5'-dinitro** (CHIMISCHE FABRIK GRIESHEIM-ELKTRO), A., i, 493.
- Benzidine platinbromide** (GUTRIER, BAUMGART, and OBERMAIER), A., i, 33.
- 2-Benzidine-*n*-naphthaquinone** and *o*-*o*-dichloro-, and their derivatives (PHEMMEK and BRASS), A., i, 655.
- Benzidylcamphorformeneamine** (TINGLER and BATES), A., i, 55.
- Benzilbenzoylphenylhydrazones** (LAUFER, DANNEHL, and BORN-NECKE), A., i, 171.
- Benzilic acid**, decomposition of (STAUDINGER), A., i, 308.
- β*-Benzil *o*-tolylsazones** (PADMA and SANGH), A., i, 693.
- Benziminazole oxide** and its salts (V. NIEMENOWSKI), A., i, 85.
- Benziminazoloncarbalic acid** (BERTHELM), A., i, 1056.
- Benziminosulphide** and its salts and acetyl derivative (MAISTRI), A., i, 291.
- o*-Benzoylaminopyridine** (PALAZZO and TAMBURINI), A., i, 327.
- Benzoyl amylamide** (V. BRAUN and SOBECKI), A., i, 128.
- Benzoylarsine dichloride**, quinine ester of (OCHSINS), A., i, 760.
- Benzoylarsinic acid**, quinine ester of (OCHSINS), A., i, 760.
- β*-Benzoglucose**, isomer- (FISCHER and HELFERICH), A., i, 693.
- Benzoic *o*-acetyloxybenzoic anhydride** (EINHORN and SEFFERT), A., i, 54.
- Benzoic acid**, preparation of (SABATIER and MAILLET), A., i, 258.
- hydroxamide** (MASSARD and MONTMAY), A., i, 289.
- copper salt**, compounds of, with pyridine and quinoline (BRADY), P., 94.
- tert. butyl ester** (FANKE), A., i, 783.
- o*-dichloro-*m*-tolyl ester** (RASCHE), A., i, 637.
- Benzoic acid, *o*-amino**. See Anthranilic acid.
- p*-amino** and its acetyl derivative, benzoylmethyl esters of (KUNCKE), A., i, 990.
- ethyl ester, glycnamide of** (EINHORN and SEFFERT), A., i, 45.

- Benzoin acid**, 2:3:5-tribromo-, methyl ester (ULLMANN and KOPPELHORN), A., i, 292.
 2:5-dibromo-4-amino- (KUSCKELL), A., i, 990.
 2:6-dibromo-4-amino-, acetyl derivative, *m*-tolyl and 4-chloro-6-benzoyl amino-*m*-tolyl esters (RAIFORD), A., i, 993.
 fluoro-, and iodo-, menthyl esters of, and their rotation (COHEN), T., 1058; P., 123.
p-hydroxy-, potassium salt, crystallography of (ROBATH), A., i, 864.
 methyl ester chlorocarbonate (EINHORN and ROTHLAUF), A., i, 705.
di-m-hydroxy- (FISCHER, FREUDENBERG, and LEPSICH), A., i, 875.
tri-hydroxy- (v. HEMMELMAYR), A., i, 983.
 3:5-dinitro-4-hydroxy-, compounds of, with aromatic hydrocarbons (MORGENSTERN), A., i, 976.
 dithio- (phenylcarbothionic acid), salts and esters of (HOHN and BLOCH), A., i, 48.
Benzoin acid, detection of, in butter and other fats (FRIESE), A., ii, 1142.
 detection of, in foods (POLENSKE), A., ii, 1142.
 estimation of (FOLIN and FLANDRUS), A., ii, 1039.
Benzoin acids, hydroxy-, oxidation products of (PERKIN), T., 1442; P., 194.
 nitro-, preparation of (LITIGEN), A., i, 128.
Benzoin *o*-benzoyloxybenzoic anhydride (EINHORN and SEUFFERT), A., i, 54.
***o*-Benzoiesulphinide**, action of chlorine on (BERTOLO), A., i, 858.
 See also "Saccharin."
Benzoin mononitrate (FRANCIS and KEANE), T., 348; P., 44.
1-Benzoin-*β*-naphthindole 3-sulphonic acid, 1-hydroxy- (KALLE & Co.), A., i, 917.
Benzonitrile, condensation of thiobenzamide with (MATSUMI), A., i, 201.
Benzonitrile, *p*-amino-, benzoyl and formyl derivatives, 3:4-diamino-, 3-nitro-4-amino-, and its acetyl derivative (BOGENT and WINK), A., i, 46.
Benzophenone, action of acids and ethers with (PATERNO and CHIEFFI), A., i, 66.
 compounds of aluminium halides with (MENSCHUTKIN), A., i, 65.
 hydrobromide and hydrochloride (MAASS and MCINTOSH), A., i, 239.
 brucine sulphite (MAVER), A., i, 223.
Benzophenone, *p*-amino-, compounds of, with *β*-naphthol and *β*-naphthaldehyde (TORREY and PORTER), A., i, 340.
 3:5-dibromo-4-amino- (CLARKE and ESKLEN), A., i, 725.
 chloroimino- (PITTSERSON), A., i, 88.
 polyhydroxy-, colouring-matters of, relation between chemical constitution and fastness to light of (WATSON and DUTTA), A., i, 305.
***β*-Benzopinacol**, preparation of (ZERNER), A., i, 44.
***o*-Benzoquinone**, two forms of (REICHMANN), A., i, 883.
***o*-Benzoquinone**, 3- and 4-chloro-, and 4:5-dichloro-, and quinhydrone of the latter (WILLSTÄTTER and MÜLLER), A., i, 729.
***p*-Benzoquinone**, electrolytic oxidation of (KEMPF), A., i, 464.
 mechanism of reactions of (ROSE), A., i, 554.
 oxidation of amino-acids by (THAYER), A., i, 960.
 equilibrium of the reaction of with hydrogen chloride (SCHMIDT), A., i, 727.
 compounds of, with pyrogallol, hydroxyquinol, phloroglucinol, and 2:3:4-hydroxynaphthalene (SIEGWINDE), A., i, 654.
***p*-Benzoquinone**, *m*-dibromo-, ethyl-, *m*- and *p*-dichloro-, and triethyl-*β*-lactones from (STAUBINGER and BEREZZA), A., i, 461.
 2-bromo-4-chloroimino-, and 2-chloro-6-bromo-4-chloroimino- (RAIFORD), A., i, 993.
 hydroxy- (WILLSTÄTTER and MÜLLER), A., i, 729.
 3:6-dinitro-2:5-dihydroxy- (same as acid), preparation of (NIEZKI), A., i, 69.
***o*-Benzoquinones**, (WILLSTÄTTER and MÜLLER), A., i, 728.
***p*-Benzoquinone-2-acetic acid**, 4-amino-, and its ammonium salt (MORSE), A., i, 56.
***p*-Benzoquinone di-2-*α*-naphthylquinoxaline-imine** (PUMMERER and BRASS), A., i, 855.
***p*-Benzoquinoneoxime**, 2:6-bis-phenylhydrazone (BORSCHKE and KANTSCHEFF), A., i, 331.
***p*-Benzoquinoneoxonium hydrochloride** (RICHTER), A., i, 135.
Benzotetronic acid. See Coumarin-4-hydroxy-.
Benzotrichloride, *o*-chloro- (FAHRENBACH, VORM. MEISTER, LUCIUS, & FLANDRUS), A., i, 445.

- Benzotrichloride**, 2:3:5:6-tetrachloro-
NITROBENZENE, A., i, 346.
- Benzoylmalic acid**, fate of, in the body
(DAKIN), A., ii, 419.
- Benzoylmalic acid**, action of phenylhydrazine
on (KÖHLING), A., i, 87.
- Benzoylmalic acid**, dexametropy of (MEYER),
A., i, 865.
- Benzoylmalic acid**, metallic salts (KNORR), A., i, 977.
- Benzoyl- γ -acetyl- β -phenylbutyric
acid**, ethyl ester (DIECKMANN and V.
FISCHER), A., i, 451.
- Benzoylanilino-1-o-nitrophenyl 3-
methylpyrazole** (MICHAELIS, GRAFF,
GERING, and BOHE), A., i, 235.
- Benzoyl- α -anisidines**, o-, m-, and p-nitro-
nitration of (REYERDIN), A., i, 776.
- Benzoylanthranyl**, constitution of (HIL-
LER), A., i, 81.
- Benzoylanthranyl**, m- and p-nitro- (BOGERT, GÖRNER,
and AMEND), A., i, 581.
- Benzoylanthranyl acid**, m- and p-nitro-
(JEWERT, GÖRNER, and AMEND), A.,
i, 580.
- Benzoylbenzene**, o-, m-, and p-nitro-
(GASTALDI), A., i, 1047.
- Benzoylbenzene**, p-bromobenzene, o-, m-, and
p-nitro- (GASTALDI), A., i, 1047.
- Benzoylbenzoic acid**, reduction pro-
ducts of the anhydrous of (ROSE),
A., i, 372.
- Benzoylbenzoic acid**, 3,6- and 4,5-dichloro- (ULLMANN and
BILLIG), A., i, 490.
- Benzoylbenzoic acid**, p-bromo- (ULLMANN
and SONE), A., i, 468.
- Benzoyl-4-benzylidenhydantoin**, 2-
thio- (WHEELER, NICOLET, and JOHN-
SON), A., i, 1031.
- Benzoyl-p-bromophenylhydrazine**, m-,
o-, and p-nitro- (GASTALDI), A., i,
1047.
- Benzoyl-p-bromosalicylamide**,
(HUGHES and TITHERLEY), T., 28.
- Benzoylbutyric acid**, ethyl ester, and
its oxime (HALLER and BATTIEL), A., i,
300.
- Benzoyl- γ -iso-, and *tert.* butyryl- β -
phenylbutyric acids**, ethyl esters
(DIECKMANN and V. FISCHER), A., i,
452.
- Benzoyl- ϕ -cumidylguanidine** (PIERONI),
A., i, 166.
- Benzoyldehydracetic acid**, action of
ammonia on, and formation of its
lactam (PETRENKO-KRITSCHENKO and
SCHÖTTE), A., i, 1020.
- Benzoyl-3:4-diacetylgallic acid**,
(FRANCIS and NIERENSTEIN), A., i,
644.
- Benzoyldianilinoethylbenzene** and its salts
and compounds with phenols (EVEREST
and McCORMIE), T., 1758.
- Benzoyldiethylmalamic acid** (FRUXE
and FLEISCHER), A., i, 236.
- Benzoylenecarbamide**, synthesis of
(FINGER and GENZIER), A., i, 237.
- Benzoylenedimethylpyrrolidone** and its
derivatives (GABRIEL), A., i, 228.
- Benzoylenedimethylpyrrolone** (GAB-
RIEL), A., i, 228.
- Benzoylenedimethylpyrrolone**, 4-amino-, 4-bromo-, and 4-nitro-deriv-
atives (GABRIEL), A., i, 228.
- Benzoylenedimethylpyrrolonecarboxylic
acid**, ethyl ester (GABRIEL), A., i,
227.
- Benzoyl- ϕ -ethylhydantoinic acid** and
thio-, and their ethyl esters (WHEELER,
NICOLET, and JOHNSON), A., i, 1031.
- Benzoylformaldehyde**, m-nitro-, oxida-
tion of (EVANS and WITZMANN), A.,
i, 387.
- Benzoylguanidine** and m-nitro-
(TRAUER), A., i, 115.
- Benzoylhexoic acid**, ethyl ester, and its
p-nitrophenylhydrazine (HALLER and
BATTIEL), A., i, 727.
- Benzoylhomopiperonylamine** (FABER-
FABER, GEHME, F. BAYER & CO.),
A., i, 1015.
- Benzoylhydantoinic acid** and thio-, and its
ethyl ester (WHEELER, NICOLET, and
JOHNSON), A., i, 1031.
- Benzoylhydrobromoquinone** and its
soluble (VERGINSKE, CHININ-
FABER, ZIMMER & CO.), A., i,
539.
- Benzoylindole** (WEISSERBERGER), A., i,
155.
- Benzoylindole** and its derivatives
(HUGHES and SASS), A., i, 487.
- Benzoylisation 3 phenylhydrazones**
(MAYERS and BORNKRECK), A., i,
588.
- Benzoyl-m-methylaminoacetophenone**
(KOLLMANN and PLAT JANINI), A.,
i, 916.
- Benzoyl- ϕ -methylhydantoinic acid**, ethyl
ester (WHEELER, NICOLET, and JOHN-
SON), A., i, 1031.
- Benzoyl- β -methylpentane** (HALLER
and BATTIEL), A., i, 652.
- Benzoylmethyl-*tert.*-propane** and its p-
nitrophenylhydrazine (BLAISE and
HEERMAN), A., i, 881.
- Benzoyl- γ -methylvaleric acid** and its
ethyl ester and their oximes (HALLER
and BATTIEL), A., i, 727.
- Benzoylnaphthoylbenzene** (GUYOT and
VALLETTE), A., i, 654.
- Benzoyloxacetamide**, p-nitro- (EIN-
HORN and SEIFFERT), A., i, 45.
- Benzoyloxacetic acid**, p-amino-, and
p-nitro-, ethyl esters of (EINHORN and
SEIFFERT), A., i, 45.

- 4-Benzoyloxy-3-aldhydriphenylacetic acid (BISTRZYCKI and VELLMANN), A., i, 133.

- Benzyl 8 hydroxypropylmalonic acid** and its silver salt (JOHNSTON and HILL), A., i, 503.
- Benzylidene chloride**, 2,3,4-trichloro-, (NIGGEMANN), A., i, 316.
- 4-Benzylideneamino 2 acetyl α -naphthol** (TORREY and CARPARELLI), A., i, 68.
- Benzylideneamino α phenylacetamide** (CHAIKIN and FRANKS), T., 320; P., 22.
- 3-Benzylideneamino 2 styryl 4 quinazolinone**, and its hydrochloride and 6- and 7-amino-, diacetyl derivatives (BOGERT, REIL, and AMEND), A., i, 162.
- Benzylideneaniline**, *o*-isole (MAYER), A., i, 859.
- Benzylideneanthraquinonehomosalicylic acid**, *pro*-homohydroxy-, and *pro*-homohydroxy-, and the potassium salt of the latter (TIFFENEAU and HELLMAN), A., i, 543.
- Benzylidene bases**, electrolytic reduction of (LAW), P., 310.
- Benzylidene 5 bromosalicylamide** (HUGHES and TITCHELEY), T., 26.
- Benzylidene α cinnamylidenacetophenonehydroxylamineoxime** (GUSA and TERNI), A., i, 918.
- Benzylidenedehydracetic acid** (HALE), A., i, 722.
- Benzylidenedehydracetocarboxylic acid** (HALE), A., i, 722.

- Benzylidenediacetyl.** See Styryl methyl diketone.
- o*-Benzylidene- γ -dimethylparaconic acid, *p*-chloro-** (STOBZ and WAHL), A., i, 374.
- Benzylidenesulphatein**, aluminium compound of, and 3:5-dichloro-4-hydroxy-, and its ammonium salt and *p*-nitro- (WHEELER and HOFFMAN), A., i, 499.
- o*-bromo-, *o*-chloro-, and *o*-thio-** (WHEELER, HOFFMAN, and JOHNSON), A., i, 923.
- Benzylidenesulfoxyl, *o*-amino-, and *o*-nitro-** (NOELTING and STEUER), A., i, 165.
- Benzylidenesulphonyl chloride** and its additive compound with pyridine (STAUDINGER and OTT), A., i, 640.
- Benzylidene β -triacetylaminio, *p*-nitro-** (FORSTER and NEWMAN), T., 1280; P., 154.
- Benzylminophthalanil** (REINERT and HOLLE), A., i, 982.
- Benzylidene** (WEISSGERBER), A., i, 713.
- Benzylmethylallylamino** and its platinum chloride (EMDE and SCHELLBACH), A., i, 282.
- Benzylmethylallylpropylammonium chloride** (EMDE and SCHELLBACH), A., i, 282.
- Benzylmethylamine, *p*-hydroxy-, and salts** (TIFFENEAU), A., i, 778.
- 3:4-dihydroxy-, and its hydrochloride** (TIFFENEAU), A., i, 973.
- o*-Benzyl- α -methylbutyric acid** (DUMESNIL), A., i, 719.
- Benzylmethylethanol, ω -amino-, and its hydrochloride** (SCHMIDT and CALLESS), A., i, 742.
- 5-Benzyl-10-methyldihydroacridine, 5-cyano-** (KAUFMANN, ALBERTINI, and WIDMER), A., i, 751.
- Benzylmethylethylacetamide** (DUMESNIL), A., i, 719.
- Benzylmethylethylacetophenone** (DUMESNIL), A., i, 719.
- Benzylmethylethylethanol, preparation of** (DAVIES and KIPPING), T., 298.
- 3-Benzyl-1-methylcyclohexan-3-ol** (MAILHE and MURAT), A., i, 127.
- 3-Benzyl-1-methylcyclohexone** (MAILHE and MURAT), A., i, 127.
- Benzyl methyl ketone, 2:6-dinitro-, and its phenylhydrazine** (BORSCHKE and RANTSCHKEFF), A., i, 332.
- 5-Benzyl-7-methyltetrahydroxanthiazole 4-one-5-carboxylic acid, 2-amino-, ethyl ester** (JOHNSON and HILL), A., i, 503.
- 5-Benzylsuccinimide** (WILLIAMS and ALBERT), A., i, 883.
- Benzylphenylmethylethanol, preparation of** (DAVIES and KIPPING), T., 298.
- 2-Benzyl- α -pyrone, 6-chloro-, and 6-hydroxy-, and salts of the latter** (TROLL and THORPE), T., 2229.
- Benzylpyruvic acid, brucine salt** (HITCH), T., 235.
- Benzylsulphenyl chloride, *o*-thio-** (FARBWÄRKER VOM MEISTER, LECHT, & BRENING), A., i, 443.
- Benzyl- β -thiocarbamide nitrite** (ALBERT), A., i, 919.
- 2-Benzylthiol-1-phenyl-4-benzylidenesulphatein** (WHEELER and HOFFMAN), A., i, 500.
- 5-Benzyl-5-thiolpropylbarbituric acid** (JOHNSON and HILL), A., i, 502.
- Benzyl- β -thiolpropylmalonic acid, potassium hydrogen salt of** (JOHNSON and HILL), A., i, 503.
- Benzyltrimethylammonium, *p*-hydroxy-, chloride and iodide** (TIFFENEAU), A., i, 779.
- 1-Benzyl-2:6:8-trimethyltetrahydroquinoline hydriodide** (JONES and EVANS), T., 338.
- o*-Benzyl- γ -valerolactone- α -carbonyl thiocarbamide** (JOHNSON and HILL), A., i, 503.
- o*-Benzyl- γ -valerolactone- α -carboxylic acid and its silver salt** (JOHNSON and HILL), A., i, 503.
- Berberine, synthesis of** (PETERSEN and GAMES), A., i, 807.
- constitution and spectroscopic examination of** (TINKLER), T., 1319; P., 162.
- sulphite and benzaldehyde sulphite** (MAYER), A., i, 224.
- Beryl** from pegmatites of Madagascar (DUPARC, WUNDER, and SAGOT), A., ii, 1105.
- rose, optical properties of** (LACROIX and RENGADEL), A., ii, 736.
- Botaine, occurrence of, in the mass of cephalopods** (HENZE), A., ii, 216.
- isolation of, from plants** (STANKE), A., ii, 818.
- wandering of, in plants** (STANKE), A., ii, 1124.
- Betaines, formation of** (KIRPAL), A., ii, 156.
- in plant tissues** (SCHILZE and FRIEDRICH), A., ii, 426.
- Biguamide, preparation of** (OSTERWICH), A., i, 429.
- Bile, presence of, in the stomach** (CART), A., ii, 749.

- Bile**, effect of protein food on the secretion of (LOAN), A., ii, 51.
 chemical reaction of (QUAGLIARIELLO), A., ii, 1114.
 of hippopotamus. See under Hippopotamus.
- Bile pigments** (FISCHER), A., i, 803; (FISCHER and MEYER-BETZ), A., i, 1004; (FISCHER and MEYER), A., i, 1005.
 formation of, from blood (BRUGSCH and YOSHIMOTO), A., ii, 629; (BRUGSCH and KAWASHIMA), A., ii, 630.
 reduction of, by means of palladium (VILLE), A., i, 554.
 detection of, in urine (V. MANLOFF), A., ii, 1144.
- Bile salts**, anti-bactericidal action of (CUMMINS), A., ii, 1123.
- Biliary acids**, isolation of individual (PAGEL and BUCHTALA), A., ii, 1009.
- Binary compounds**, analysis of (OSTROMENSKY), A., ii, 195; (RUFF), A., ii, 264.
- Binary mixtures**. See Mixtures, binary.
- Binary systems**, equilibrium in (VAN KLOOSTER), A., ii, 111; (BORNE MANN), A., ii, 195.
 application of the phase rule to mixed crystals in (PHINS), A., ii, 196.
 of partially miscible liquids, vapour pressure of (KOHNGRAMM and TIMMERMANS), A., ii, 370.
- Biotoxins** (MARINO-ZUCO, ONGIATO, and GIGASINO), A., ii, 1104.
- Birch camphor**, micro-chemistry of (TUNMANN), A., ii, 1022.
- Bis-3- and 5-acetyl-2:4 dimethylpyrrolethane** (COLACICCHI), A., i, 1030.
- Bis-3- and 5-acetyl-2:4 dimethylpyrrolmethane** (COLACICCHI), A., i, 1030.
- 4:4' or 2:2'-Diabenzeneazo-3:5:3':5'-tetrahydroxydiphenyl** (MEYER and MEYER), A., i, 873.
- Bis-p-benzoquinoneoxonium hydrotri sulphide** (RICHTER), A., i, 135.
- Bis-5-benzoyl-2:4-dimethylpyrrol-*n*-and-*n*butane** (COLACICCHI), A., i, 1030.
- Bis-5-benzoyl-2:4 dimethylpyrrol-ethane** (COLACICCHI), A., i, 1030.
- Bis-5-benzoyl-2:4-dimethylpyrrol-heptane** (COLACICCHI), A., i, 1030.
- Bis-5-benzoyl-2:4-dimethylpyrrol-methane** (COLACICCHI), A., i, 1030.
- Biscarbostyrylspran**-and its chloride (RADULACU), A., i, 494.
- Biscinnamylidenacetophenone**, compound of, with tin tetrachloride (PREIFFER, FRIEDMANN, GOLDBERG, PROS, and SCHWARZKOPF), A., i, 791.
- Bis-*de-N*-methylbishydrocetanine and its salts** (FREUND and KUPFER), A., i, 912.
- Bis-*de-N*-methylbishydrocetanine and its salts** (FREUND and KUPFER), A., i, 912.
- Bisdiazotetrazolehydrazide and its sodium derivative** (HOFMANN and HOSN), A., i, 1018.
- Bisdicinnamylidenacetone**, compound of, with tin tetrachloride (PREIFFER, FRIEDMANN, GOLDBERG, PROS, and SCHWARZKOPF), A., i, 791.
- Bisdiethylmalonhydrazine acid** (FREUND and FLEISCHER), A., i, 236.
- Bisdiethyrosocorine** (GORTER), A., i, 562.
- Bisdimethylpyrone**, compound of, with tin tetrachloride (PREIFFER, FRIEDMANN, GOLDBERG, PROS, and SCHWARZKOPF), A., i, 791.
- Bi-diphenylacetylhydrazide and its chloride** (STOLLE and LAUX), A., i, 508.
- Bisdiphenylbromacetylhydrazide chloride** (STOLLE and LAUX), A., i, 508.
- Bisdiphenylchloracetylhydrazide chloride** (STOLLE and LAUX), A., i, 508.
- Bisdiphenylchlorovinylid-imide** (STOLLE and LAUX), A., i, 508.
- Bisdistyryl ketone**, compound of, with tin tetrachloride (PREIFFER, FRIEDMANN, GOLDBERG, PROS, and SCHWARZKOPF), A., i, 791.
- Bis-*n*-ethylbutyrylhydrazide** (FREUND and FLEISCHER), A., i, 236.
- α :3-Bis[4 or 5-glyoxaline] propionic acid dipicrate** (PYMAN), T., 2178.
- α :3-Bis[4 or 5-glyoxaline] propionitrile, salts of** (PYMAN), T., 677.
- β :3-Bis[4 or 5 glyoxaline] propylamine and its salts** (PYMAN), T., 2178; T., 275.
- Bishydrath, tolu** (*di-p-tolylbishydrath-cethalene*) (FRIEDRICH and KASTNER), A., i, 325.
- Bis-1 hydriodone (2:2)-spiran** (RADULESCU), A., i, 494.
- Bishydrocetanines**, isomeric, and their salts and derivatives (FREUND and KUPFER), A., i, 911.
- Bisketophenylthionaphthen** (KALLE & CO.), A., i, 667.
- Bisketotolylthionaphthen** (KALLE & CO.), A., i, 667.
- Bis-p-methylbrucine and its derivatives** (LEUCHS and ANDERSON), A., i, 746.
- salts of (LEUCHS and ANDERSON), A., i, 1018.

- Bismomethylidenehydrazine** nitrate, nitro-, (LEUCHS and ANDERSON), A., i, 1018.
- Bismuth salts**, action of hydrogen and sodium peroxides on (HANEŠ and KALLAUER), A., ii, 404.
- Bismuth carbonate** (VASINO), A., ii, 806.
- hydride, attempts to prepare (VASINO and ZUMBURCH), A., ii, 1098.
- oxides (VASINO and ZUMBURCH), A., ii, 118.
- Bismuth**, volumetric estimation of (VASINO), A., ii, 1139.
- Bismuth ochres** from California, (SCHALLER), A., ii, 235.
- Bismuth ores** (PRIZOZNİK), A., ii, 991.
- Bismuthides** (VOENAROS; LEECH), A., ii, 405.
- Bisnitrobenzenes-*o*-xylene** (GREEN and BEARD), T., 1971; P., 229.
- Bisnitroso-compounds**, relation between arylnitrosohydroxylamines and BAMBERGER, A., i, 996.
- Bis-4-oximino-5-pyrazolone** (UTETIS and GUCKEL), A., i, 403.
- Bisoxethionaphthen** ("thionidigo"), synthesis of (PRESCOTT and SMILES), P., 317.
- Bisoxethionaphthen**, chloro-, preparation of (GESELLSCHAFT FÜR CHEMISCHE INDUSTRIE IN BASEL), A., i, 4-1.
- Bisphenyl-*tert*-butylpyrazolone** (WAHLBERG), A., i, 709.
- Bisphenyl styryl ketone**, compound of, with tin tetrachloride (FRIEDBERG, FRIEDMANN, GOLDBERG, PROS, and SCHWARZKOPF), A., i, 791.
- Bis-*p*-tolliketazine** (CURTIS and KASTNER), A., i, 325.
- 4,4'-(or 2,2')-Bis-*p*-toluene-*so* 3,5,3',5'-tetrahydroxydiphenyl** (MEYER and MEYER), A., i, 873.
- Bis-*p*-toluoyl-*p*-tolylazimethylene** (CURTIS and KASTNER), A., i, 325.
- Bistolythioglycollic acid** (KALLE & Co.), A., i, 667.
- Bixin**, constitution and derivatives of, (VAN HASSELT), A., i, 550.
- and its derivatives (HEIDENHUK and RIFFART), A., i, 315.
- isoBixin** and its ethyl ether and potassium derivative (VAN HASSELT), A., i, 551.
- Bleaching** and polymerisation (STOBBE and EBERT), A., ii, 452.
- investigation of the process of (HIGGINS), P., 314.
- Bleaching powder**, action of carbon dioxide on (HIGGINS), T., 853; P., 67; (TAYLOR), T., 1906; P., 243.
- Blende** from Picos de Europa, composition of (LORD Y GAMBOA), A., ii, 733.
- Bismetrandine** from the Urals (HALL and HERRFELD), A., ii, 46.
- Bismetrandite** from Madagascar (LA CROIX), A., ii, 296.
- Blood**, influence of compressed air on formation of (BOENSTEIN), A., ii, 301.
- volume and growth of the, in rats (CHISOLM), A., ii, 1107.
- action of radium emanation on (BERRY and RUSE), A., ii, 599.
- action of blood-lipoids on the coagulation of (KEPINOVA), A., ii, 125.
- effect of altitude on the dissociation curve of (BARCKHOFF), A., ii, 111.
- influence of lactic acid on the dissociation curve of (BARCKHOFF and ORRELL), A., ii, 124.
- fat-splitting power of the (BARDENHAGEN and ROSA), A., ii, 115.
- influence of a transplanted sarcoma (CHISOLM), A., ii, 1108.
- influence of under-feeding on (BARDENHAGEN and CHISOLM), A., ii, 1107.
- influence of hydrazine on the action of sugar in (UNDERHILL), A., ii, 110.
- solubility of gases in (FINDLEY and CREIGHTON), A., ii, 211.
- regulation of respiration by the (WATERSTEIN), A., ii, 211.
- effect of oxygen breathing on (WABER), A., ii, 211, 567.
- oxygen-transport capacity of, at different temperatures (V. LIEBERMAN and WIESNER), A., ii, 993.
- formation of bile pigment from (BRUGSCH and YOSHIMOTO), A., ii, 630.
- (BRUGSCH and KAWAHIMA), A., ii, 630.
- preparation of a catalase from (W. and DE STOECKLIN), A., i, 412.
- coagulation of (WEISS), A., ii, 739.
- denaturation of (MEDEVEFF), A., ii, 739.
- oxidation in (ONAKA), A., ii, 409.
- regeneration of (MANING), A., ii, 739.
- regeneration of, after destruction and hemorrhage (JONES), A., ii, 995.
- scission of esters in (ROSA), A., ii, 739.
- hydrolysis of esters and fats by (ROSA and MICHAELIS), A., ii, 392.
- influence of transfusion of, on metabolism of matter and energy (HALL), A., ii, 739.
- presence of pancreatic secretion in (CARLSON and DRENNAN), A., ii, 995.
- effect of potassium salts on circulation of the (MATHISON), A., ii, 733.
- influence of poisons on the enzymes (DUNKER and JODLBAUER), A., ii, 756.

- dead, toxic substances in, after thyroidectomy (TRENDLENBURG), A., ii, 50.
- champra in, after nephrectomy and ureteral ligation (JACKSON), A., ii, 409.
- trimethylamine in (DORR and GOLL), A., ii, 212.
- sugar of (RONA and TAKAHASHI), A., ii, 135; (FRANK), A., ii, 301; FRANK and BRETSCHNEIDER, A., ii, 409.
- ascidians', constituents of (HENZE), A., ii, 740.
- carotid, effect of increased temperature of the (MOORHOUSE), A., ii, 739.
- dog's, fat in (LATTES), A., ii, 994.
- frog's, action of anti-coagulants on (PRINGLE and TAIT), A., ii, 739.
- human, residual carbon in (MANCINI), A., ii, 504.
- distribution of reducing substances in (LYTTIKENS and SANDGREN), A., ii, 301.
- humanian, distribution of reducing substances in (LYTTIKENS and SANDGREN), A., ii, 994.
- new reagent for (GIASSINI), A., ii, 556.
- reactions of Van Deen and Adler for (BONGIOVANNI), A., ii, 676.
- action of metals on the reagents for, in presence of hydrogen peroxide (MICHEL), A., ii, 558.
- reactions of, and detection in urine (WEITERRECHT), A., ii, 447.
- detection of (V. FÜRTH; SARIOBY), A., ii, 947.
- detection of, by leucomalachite green (MICHEL), A., ii, 675.
- estimation of the quantity of, in the body (MARKOFF, MÜLLER, and ZURKE), A., ii, 1107.
- estimation of alkalis in (BERNHARDT), A., ii, 1031.
- estimation of calcium in (VOORHOEFF), A., ii, 126.
- estimation of chlorides in (OPTLER), A., ii, 150.
- estimation of lactic acid in (FRIEN), A., ii, 994.
- normal and pathological, estimation of oxyprotic acids in (CZESENEK), A., ii, 302.
- estimation of sugar in (MICHAELIS and RONA), A., ii, 73; (RONA and DOBLIS), A., ii, 302; (FRANK), A., ii, 340; (LÉPINE and BOULUD), A., ii, 619.
- blood-corpuseles, isoelectric constants of the constituents of (MICHAELIS and TAKAHASHI), A., ii, 48.
- blood-corpuseles, calcium content of the (RONA and TAKAHASHI), A., ii, 302.
- permeability of (GRYNS), A., ii, 740.
- permeability of, to dextrose (RONA and DOBLIS), A., ii, 302.
- red, permeability of, to alkali and alkali earths (GRYNS), A., ii, 49.
- influence of salts and non-electrolytes on the permeability of (MICHEL), A., ii, 49.
- difference between individual (DILLENES), A., ii, 740.
- action of arsenic on (ONAKA), A., ii, 212.
- haemolysis of (BRAHMACHARI), A., ii, 213; (RUSSEYAK), A., ii, 1108.
- haemolysis and agglutination of (DUNIS BORKOWSKI), A., ii, 212.
- influence of oxidation in (WARRING), A., ii, 49.
- behaviour of, in oleic acid poisoning (SUMIKI and FIDBY), A., ii, 125.
- action of selenium solution (JONZA), A., ii, 1105.
- Blood-gas apparatus, determination of the constants of (HAREGROFT and HIGGINS), A., ii, 765.
- Blood pigment, constitution of the coloured constituent of (PIROTY, QUELMANN, and EFFINGER), A., i, 95.
- decomposition of (BARBARIZI), A., i, 95.
- valency of the metal in (MANFROT), A., i, 96.
- valency of iron in (KUSTER), A., i, 409.
- action of pyridine on (KALMUS; V. ZEYNEK), A., i, 95.
- Blood plasma and serum, dipeptide-splitting action of (HALL and WILLIAMSON), A., ii, 302.
- Blood platelets, human (AYSAUD), A., ii, 213.
- Blood pressure, action of choline on (FOTIKSKI), A., ii, 124; (ANDERHAGEN and MÜLLER), A., ii, 994.
- influence of digitalis substances on (HERNANDEZ), A., ii, 1017.
- action of extracts of invertebrate tissues on (GAUTRELET), A., ii, 1107.
- effect of injection of pineal extracts on (EYSTER and JORDAN), A., ii, 215.
- action of potassium salts on (MATHIASSEN), A., ii, 125.
- lowering of, by urine (POMIELSKI), A., ii, 511.
- Blood-serum, solubility of gases in (FINDLAY and CECILTON), A., ii, 211.

Blood-serum, influence of antipyrine on the proteins of (CERVELLO), A., ii, 409.

changes in, during starvation (POLANYI), A., ii, 741.

maltase in (DOXIADIS), A., ii, 619.

the proteins of (BREINT), A., ii, 741.

estimation of uric acid in (ROETHLISBERGER), A., ii, 548.

Blood-stains, detection of, by benzidine (GIGLI), A., ii, 348.

Blood-vessels, action of weak acids on the (SCHWARTZ and LEMBERGER), A., ii, 809.

effects of animal extracts on the (CAMPELL), A., ii, 315.

action of chloroform on (CAMPELL), A., ii, 738.

cerebral, action of drugs on the (DIXON and HALLIBURTON), A., ii, 52.

chemical regulation of vascular tone in the (HOOKER), A., ii, 904.

Body, temperature and alkalinity of the, in relation to the instability of dextrose (HENDERSON), A., i, 769.

animal, formation of adrenaline in the (FUNK), A., ii, 907.

formation of glycine in the (FRIEDMANN and TACHAN), A., ii, 906.

behaviour of furoylacrylic and furoyl-acetic acids in the (FRIEDMANN), A., ii, 910.

behaviour of glycols in the (MICHA), A., ii, 1014.

degradation of the naphthalene ring in the (KIKKOU), A., ii, 909.

Body fluids, viscosity of (SNYDER and TODD), A., ii, 617.

Bog ores, assay of (KAYSER), A., ii, 229.

Boedeker's reaction, method of applying (HERNANDEZ), A., ii, 226.

Boiling-point, determination of (v. RECHENBERG), A., ii, 95; (HANSEN), A., ii, 468.

determination of, of saturated aqueous solutions (BENKELEY and APPLEBY), A., ii, 1062.

Bolognian stones (phosphorescent calcium, strontium and barium sulphide preparations) (VANINO and ZUMBUSCH), A., ii, 885.

Bone, chemistry of healthy and rachitic (GASSMANN), A., ii, 129.

Borax. See Sodium borate.

Bordeaux mixture, action of carbon dioxide on (GIMINGHAM), A., ii, 764.

Boric acid. See under Boron.

Borides, crystallography of (DE SCHULTEN), A., ii, 486.

Borneol, transformation of, into camphor (ALOY and BRUSTIER), A., i, 730.

Boroylaniline and its derivatives (L. MANN and SCHMID), A., i, 70.

1-Bornyl diphenylidithiocarbamate, tautomeric dichroism of (BRCHAT, A. and BERNY), A., ii, 741.

Bornylene, oxidation of (HENDERSON and HILBRON), T., 1896; P., 219.

compound of, with ethronyl (HENDERSON and HILBRON), T., 1891; P., 248.

nitrosites (HENDERSON and HILBRON), T., 1896; P., 219.

Bornylencarboxyl chloride, hydrazide and azide (BREDT and HILBRON), A., i, 657.

Bornylene. See β -Camphor.

Bornyl-*o*- and *p*-toluidines and their hydrochlorides (ULLMANN and SCHMID), A., i, 71.

Bornyl-*m*-4-xylylene (ULLMANN and SCHMID), A., i, 71.

Borodialcyllic acid, zinc hydride salt of (FOELSING), A., i, 449.

Boron hydrides, preparation of (H. MANN), A., ii, 279.

Boric acid, solubility and hydration (NASINI and AGNO), A., ii, 445.

tolerance of plants to (AGNO), A., ii, 142.

esters of (COHN), A., i, 640.

compound of aluminium and (F. ISCHER, FABRIK COSMOS-ANALYT), A., ii, 984.

detection of, in preservatives (FELLENBERG), A., ii, 657.

Boric acids (HOLT), A., ii, 729.

Borates, distribution of, in potash deposits (BILTZ and MANN), A., ii, 1101.

Metaborates, alkali, and metaphosphates, fusion of (VAN KESSEL), A., ii, 110.

Perboric acid, detection of (LESLIE and RICHTER), A., ii, 823.

Borotungstic acid, constitution of a salt of (ROSENHEIM), A., ii, 612.

Brain, autolysis of the (SIMON), A., ii, 745.

isolation of cholesterol and cerebrosides from (SMITH and MARR), A., i, 44.

cerebrosides of the (LOENING and THIERFELDER), A., i, 898.

soluble ferments of the (WENDELSKI), A., ii, 627.

human, a sulphatide from (KOHLE and MANN), A., ii, 1005.

of the ox, choline in the (KOHLE and MANN), A., ii, 1005.

Brandy, detection of fusel oil in (HIZOG), A., ii, 446.

Brass, estimation of sulphur in (TENDAUER), A., ii, 150.

- Bromides and its oxime** (EASTFIELD and TAYLOR), T., 2306; P., 279.
- Brauns from Brazil** (JERK), A., ii, 131.
- Bromine**, atomic weight of, determined by electrolytic methods (GOLDBACH), A., ii, 271.
- vapour pressure and apparent super-heating of solid (CUTHBERTSON and CUTHBERTSON), A., ii, 582.
- equilibrium of, with ether (McINTOSH), A., i, 256.
- photo-kinetics of substitution by BERNER and CZARNECKI, A., ii, 241; (BRENER and LAHOCINSKI), A., ii, 242.
- hydrolysis of (BRAY and CONNOLLY), A., ii, 864.
- solutions, colour and constitution of (JOSEPH and JINENDRAHARA, T., 274.
- literation of, and iodine from aqueous solutions (LABAT), A., ii, 653.
- velocity of reaction of, on formic acid (JOSEPH), A., ii, 384.
- vapour, destruction of the fluorescence of, by gases (WOOD), A., ii, 169.
- action of, on phenols (ZINCK, FROHNEBERG, and KEMPE), A., i, 439.
- destruction of organic matter by (MAGNIN), A., ii, 1035.
- distribution of, in the organism, after administration in food (MEINER and KOTAKE), A., ii, 509.
- Hydrobromic acid** (*hydrogen bromide*), equilibrium of, with ether (McINTOSH), A., i, 256.
- Bromides**, influence of sodium chloride on the excretion of (PADERI), A., ii, 1011.
- estimation of chlorides in (RABE), A., ii, 765.
- Hypobromite reaction**, influence of electrolytes on the velocity of the (SKERBAL), A., ii, 382.
- Bromine**, reaction for (DENIGES), A., ii, 652.
- detection of, in human organs (LABAT), A., ii, 533.
- estimation of, in presence of chlorides and iodides (CLAUSMANN), A., ii, 329; (BAUBIGNY), A., ii, 532.
- estimation of, in water (GAUTIER and MOREL), A., ii, 301.
- Bromo-compounds**, aromatic, reactivity of (BOURGEOIS and FOUCASSIN), A., i, 963; (BOURGEOIS and HUBER), A., i, 964.
- monoform, cyoscopic behaviour of quaternary aromatic ammonium salts in (WEDEKIND and PASCHKE), A., ii, 1960.
- Bronze**, tempering of (GREENY), A., ii, 42.
- estimation of sulphur in (THURN-ATRE), A., ii, 150.
- Bromococcus papyrifera* (Japanese mulberry), diseases of the latex of (GREENY), A., ii, 647.
- Brucine**, iodine derivatives of (KRAUZE), A., i, 1016.
- salts of, with organic acids (HILLICH, T., 234.
- salts of phthalic and succinic acids (PICKARD and KENYON), T., 60.
- pebromide (CUSA and SCAGLIARINI), A., i, 1016.
- methylsulphate (LEUCHS and ANDERSON), A., i, 1018.
- polyhydro-sulphates (SCHMIDT and BLISS), A., i, 913.
- acetone sulphate (MAYER), A., i, 223.
- acetylphenone sulphate (MAYER), A., i, 223.
- aldehyde sulphates of (MAYER), A., i, 223.
- benzophenone sulphate (MAYER), A., i, 223.
- Brucinesulphonic acid** (LEUCHS and GIBBLE), A., i, 1018.
- Brucine acid** ethoxide and benzaldehyde sulphate (MAYER), A., i, 223.
- Bryonol** and its diacetyl derivative (POWER and MOORE), T., 943; P., 118.
- Bryony root**, constituents of (POWER and MOORE), T., 937; P., 118.
- Buchner funnel**, an addition to the (FELTON), P., 189.
- Bulbocapnine and its derivatives** (GADAMER and KUNTZE), A., i, 1012.
- d*/Bulbocapnine methyl ether and its methoxide (GADAMER and KUNTZE), A., i, 1012.
- Bumping**, prevention of (SPURRIER), A., ii, 965.
- Euphane disticha*, constituents of the bulb of (TUNIN), T., 1210; P., 149.
- Euphantine** (TUNIN), T., 1213; P., 149.
- Euphantine**, and its salts (TUNIN), T., 1213; P., 149.
- Euphorbia frutescens*, oil from (FRANCESCO and SANNI), A., i, 658, 596.
- distribution of the oil of (FRANCESCO and SERNAGIOTTO), A., ii, 1025.
- constituents of the essential oil of, and preparation of a nitrochloride from it (FRANCESCO and SERNAGIOTTO), A., i, 1000.
- Burette for use in gas analysis** (GAWALOWSKI), A., ii, 651.
- a retractor (DER HEIDE), A., ii, 651.

- Butte**, arrangement for reading a (MILBAUER), A., ii, 423; (GOSTER), A., ii, 531; (SACHS), A., ii, 650.
- holder for** (ROBERTS and McDERMOTT), A., ii, 875.
- Butadiene-*cis*-octahene**, "normal" and "sodium," and their derivatives (HARRIS and NURENHEIMES), A., i, 800.
- Butane**, *α*,*α*-diamino- (4*trans*-methylendiamine), preparation of (FABRY-FABRIKEN VOEM. F. BAYER & Co.), A., i, 526.
- α*,*β*-tribromo-, *γ*,*δ*-tribromo-*β*-hydroxy-, and *α*,*β*-tribromohydroxy-, and their derivatives (PARINELLE), T., i, 941.
- α*,*β*,*γ*-tribromo-*α*,*β*-dinitro-, and *α*,*β*-dinitro-, and its sodium salt (V. BRAUN and SOBECKI), A., i, 830.
- 1*-*β*-iodo- (PICKARD and KANTON), T., 85.
- cyclobutane** derivatives of Guthzeit, spectroscopic examination of (HARTMANN), A., i, 208.
- cyclobutanecarboxylic acid**, cyclobutyl ester (DEMJANOFF and DOJARENKO), A., i, 778.
- cyclobutanol**, preparation of (DEMJANOFF and DOJARENKO), A., i, 778.
- β*-Butanolygueric acid (SANEYOSHI), A., i, 836.
- Δ*²-Butenylbenzene (RIEHER), A., i, 848.
- Δ*²-Butinal. See Tetrolaldehyde.
- β*-Butyryl-*β*-phenylpropionic acid (SCHRAUTH, SCHOELLER, and STRUNK), A., i, 642.
- Butter**, estimation of water in (MEYER-INGH), A., ii, 78.
- shea**, constituents of (LEHERT), A., ii, 1126.
- Butyl** and nitro-, nitrites (V. BRAUN and SOBECKI), A., i, 830.
- iso*- and *tert*-Butyl bromides, equilibrium between (BRUNEL), A., i, 413, ii, 974.
- tert*-Butyl alcohol, *tribromo*-, properties of (ALDBICH), A., i, 345.
- n*-Butylamine, salts of (HILDITCH), T., 286.
- n*-*iso*Butylaminobutyric acid and its salts and esters (NIVIERE), A., i, 616.
- n*-Butylammonium ruthenium-bromide and -chloride (GUTHIER and LEUCES), A., i, 183.
- nitrite (RAY and RAKSHIT), P., 291.
- n*- and *iso*Butylammonium telluribromides and -chlorides (GUTHIER, FLURY, and MICHELER), A., i, 182.
- osmiumchloride (GUTHIER and MAISCH), A., i, 19.
- Butylbenzene**, *β*-bromo- (V. BRAUN, DEUTSCH, and KREBER), A., i, 968.
- tert**-Butylbenzene, action of light on bromination and chlorination (PARINELLE), A., i, 277.
- Butylalcohol** hydrosulphide (V. BRAUN and KIL), A., i, 602.
- cyclobutylstylylcarbimol**, transformations of (KINER), A., i, 967.
- Δ*²-Butylene, bromo- (PARINELLE), A., i, 940.
- Δ*²-Butylene, *α*,*α*-*β*-*β*-azomethylene (NEDERMEYER), A., i, 846.
- Δ*²-Butylene, *α*,*β*-dibromo-, *α*,*β*-*β*-azomethylene (PARINELLE), A., i, 942.
- Butylene** *β*-glycol, derivatives of (CIAMICIAN and SILBER), A., i, 734.
- 4(or 5)-Butylglyoxaline, *γ*-amino-, *γ*-oximinol-, and their phosphates (WIDMAN), T., 2176; P., 2176.
- 5-*tert*-Butylglyoxaline, *β*-glyoxime (WIDMAN and WAHLBERG), A., 703.
- Butylcyclohexane**, derivatives of (DARZEN and ROST), A., i, 290.
- tert*-Butylcyclohexan-4-ol (DARZEN and ROST), A., i, 290.
- tert*-Butylcyclohexan-4-one and its oxime carbazone (DARZEN and ROST), A., i, 290.
- n*-Butylhexylcarbimol, and its *α*-amino derivative (BYRTCHESKO), A., i, 967.
- n*-Butyl hexyl ketone, and its oxime carbazone (BYRTCHESKO), A., i, 967.
- ψ*-Butylhippuric acid, ethyl ester (RICHARD), A., i, 7.
- n*-Butylhydroacetarnine, and its oxime (FREUND and LEDERER), A., i, 907.
- n*-Butylhydrodrastinine, and its oxime (FREUND and LEDERER), A., i, 907.
- iso*-Butylhydrodrastinine, and its oxime salts (FREUND and LEDERER), A., 907.
- n*-Butylidenedimethane (DOBRIN), A., i, 949.
- n*- and *n*-*sec*-.Butylidenetetramethylaminodiphenylmethane (LENGER), A., i, 399.
- Butylmethyl ketone**, isonitroso- (KNOW and HESS), A., i, 1019.
- 2-*iso*Butyloxy-1-methylhydroquinone, 6,8-dinitro- (DECKER, KATMANN, PREIFER, PROHATZKA, and ALBERTINI), A., i, 1025.
- 1-*iso*Butyl-2-pyridone (DECKER, KATMANN, SASSU, and WISLOCKI), A., i, 1024.
- 1-*iso*Butylpyridinium salts (DECKER, KATMANN, SASSU, and WISLOCKI), A., i, 1024.
- n*- and *iso*Butylsilicane, trioxide (BYGDEK), A., i, 846.
- ψ*-Butyltartronic acid, ethyl ester amide of (RICHARD), A., i, 8.

- and *p*-Butyrolactone, action of light on the bromination and chlorination of (SALINILL), A., i, 276.
tert-Butyl-m-xylene-2-ol (DARIENS and KOST), A., i, 290.
 Butyramide, bromo-, (MAUGUIN), A., i, 357.
 Butyric acid, *d*-methylhexylcarbonyl ester (HILDITCH), T., 222.
 ammonium salt (FALCIOLA), A., i, 175.
 Butyric acid, α -amino- (ABDERHALDEN), A., i, 955.
 γ -amino- α -hydroxy-, and its hydrochloride and platinumchloride (FISCHER and GÖDDERTZ), A., i, 20.
 α -bromo-, and α -iodo-, guaiacol esters of (FARBENFABRIKEN VORM. F. BAYER & Co.), A., i, 630.
 β -hydroxy-, estimation of in urine (CHAIKIN and GORALIN), A., i, 1140.
 Butyric acid, α -amino- (KOELKER), A., i, 773.
 Butyric acid, α -amino-, formyl derivative (ABDERHALDEN, CHANG, and WERM), A., i, 526.
 β -amino-, and its methyl ester, and *d*- and *l*- β -amino- (FISCHER and SCHIEBLER), A., i, 527.
 Butyric acid, $\alpha\beta\beta$ -tricyano-, ethyl ester (THOLE and THORPE), T., 1659.
 α -iodo-, guaiacol ester of (FARBENFABRIKEN VORM. F. BAYER & Co.), A., i, 630.
 α -nitro-, and its salts (STEINKOFF and STEFAN), A., i, 946.
 Butyrophenone, *p*-amino-, and its derivatives (KUNCKELL), A., i, 990.
 Butyrophenone, α -amino-, and its salts (GABRIEL), A., i, 212.
 derivatives of (GABRIEL), A., i, 991.
 Butyrophenyylimino-chloride (STAUDINER, CLAR, and CZAKO), A., i, 625.
 Butyrylacetie acid, ethyl ester, copper salt of (WAHL), A., i, 108.
 Butyrylpyrrolizone and its semicarbazone (DARZENS and HOST), A., i, 988.
 Butyrylglycine, α -amino- (KOELKER), A., i, 773.
 Butyrylglucosyllic acid, ethyl ester (WAHL), A., i, 108.
 Butyrylindole (ODDO and SERRA), A., i, 487.
 Butyrylphenylcarbamide (KUNCKELL), A., i, 990.
- C.
- ethaline methonitrate (LEUCHS and ANDERSON), A., i, 1018.
 Cadmium, atomic weight of (PRENDER and HILLET), A., ii, 397.
 spectrum of (PASCHEN), A., ii, 633.
 differences of potential between, and alcoholic solutions of some of its salts (GETMAN), A., ii, 888.
 electrolytic deposition of (DOVER), A., ii, 1033.
 Cadmium alloys with magnesium, electrical conductivity and hardness of (URAUOFF), A., ii, 887.
 with mercury, conductivity of (CALVO), A., ii, 575.
 with silver (PEIRENKO and FADOROFF), A., ii, 281, 800.
 with tellurium (KOBAYASHI), A., ii, 40.
 Cadmium peroxide, preparation of (TELEOFF), A., ii, 490.
 Cadmium, precipitation of, as carbonate (SCHIEBLER), A., ii, 1188.
 estimation of, electrolytically (BENNER and ROSE), A., ii, 770.
 Carboellagic acid and its acetyl and benzoyl derivatives (PERKIN), T., 1443; P., 194.
 Cesium, absorption spectrum of (BRYAN), A., ii, 350.
 mercuric chloride (FAWCE and HAIGH), A., ii, 397.
 magnesium chromate (BARKER), T., 1329; P., 198.
 fluoride, hydrates of (DE FORCRAND), A., ii, 603.
 nitrate, behaviour of, in solution (WAGBURN and MACLENNAN), A., ii, 791.
 Caffeine, action of, on muscle (HANSON), A., ii, 414.
 reactions of, in vegetable structures (BOKORNY), A., ii, 142.
 hydrochloride, double salt of, with antimony pentachloride (THOMSEN), A., i, 484.
 and theobromine, estimation of (MONRIE), A., ii, 673.
 Caffeine. See 1336-Trimethylallantoin.
 Calabar beans, chemical examination of (SALWAY), T., 2148; P., 273.
 Calabarol and its dibenzoyl derivative (SALWAY), T., 2156; P., 278.
 Calcite, transformation of aragonite into (LACHETCHENRO), A., ii, 886.
 colour reactions of (THURUTT), A., ii, 334.
 Calcium, atomic weight of (RICHARDS and HONIGSCHMID), A., ii, 112, 204.
 and strontium, separation of the spectral lines of, in the magnetic field (MOORE), A., ii, 559.
 and alcohol, hydrogenation by means of (BREITAU), A., i, 625.

Calcium metabolism. See Metabolism.
 in blood and serum (ROWA and TAKAHASHI), A., ii, 302.
 resorption and calcification of, in the body (TAKAKA), A., ii, 907.
 requirements of plants (KONOWALOFF), A., ii, 222.
Calcium alloys with copper, lead magnesium, silver and thallium (BAAR), A., ii, 611.
Calcium salts, inhibition of exudation of fluids by (CHIARI and JANUSCHKE), A., ii, 514.
 physiological rôle of (LOWE), A., ii, 323.
 action of, on the heart (ROTHBERGER and WINTERBERG), A., ii, 1117.
Calcium bromide, efficiency of, as a drying agent (BAXTER and WARREN), A., ii, 268.
 carbide, decomposition of, by heat (EHLWEIN, WARTH, and BECKNER), A., ii, 396.
 catalytic action of potassium carbonate on the absorption of nitrogen by (POLLACCI), A., i, 358.
 carbonate, mineralogy of (MOROZOWICZ), A., ii, 121.
 action of, on sodium carbonate (OECHSNER DE CONINCK), A., ii, 396.
 action of potassium and sodium hydroxide on (OECHSNER DE CONINCK), A., ii, 490.
 sulphate, sodium carbonate and sulphate, equilibrium between (HEERZ), A., ii, 794.
 carbonates, isomorphous mixtures of, with magnesium and iron carbonates (DISEL), A., ii, 725.
 chloride, depression of the freezing-point of, and sodium chloride (LAMPLOUGH), A., ii, 581.
 calcium hydroxide and water, equilibrium in the system (SCHREINEMAKERS and FIGER), A., ii, 983.
 fluoride, plastic (COHN), A., ii, 724.
 action of, on vanadium pentoxide (PRANDTL and MANZ), A., ii, 990.
 hydroxide, calcium chloride and water, equilibrium in the system (SCHREINEMAKERS and FIGER), A., ii, 983.
 dry, absorption of the halogens by (WILKS), P., 308.
 nitrate as a manure (HENDRICK; BAESSLER), A., ii, 650.
 nitrate and nitrite, estimation of (STUTZER and Goy), A., ii, 933.
 oxide (*lime*), specific heat of fused (LASCHECHENKO), A., ii, 253.

Calcium oxide (*lime*), equilibrium of alumina and silica (HERRMANN, RANKIN, and WRIGHT), A., ii, 725.
 solubility of, in solutions of acids (CLAASSEN), A., i, 606.
 solubility of, in solutions of sodium and of glycerol (CAMERON and PATTEN), A., i, 179.
 and carbon, action of steam on a mixture of (VIGNON), A., ii, 391.
 sensitiveness of lupins to acids (PFLEFFER and BLANCHARD), A., ii, 761.
 estimation of, in sugar alcohols, products (WEISBERG), A., ii, 667.
 (LINDE), A., ii, 664.
 phosphate metabolism. See Metabolism.
Tricalcium phosphate, action of sodium hydroxide on (OECHSNER DE CONINCK), A., ii, 396.
Calcium silicates in cement (SZATHMARI), A., ii, 49.
Calcium organic compounds
Calcium bromocarbamide (GEBHART), A., i, 118.
 cyanamide (CARO, JACOBY, and SCHÜCK), A., i, 119.
 formation and decomposition of (LE BLANC and ESCHMANN), A., i, 185.
 as a manure (HENDRICK; BAESSLER), A., ii, 650.
 assay of (MONNIER), A., ii, 777.
 (STUTZER), A., ii, 777.
Calcium, detection of barium, strontium and lead (BROWNING and MEXENTHAL), A., ii, 1032.
 estimation of small quantities of (BOWSER), A., ii, 1031.
 estimation of, in the presence of magnesium (LIESSE), A., ii, 154.
 estimation of, in blood (VON DER LINDT), A., ii, 126.
 estimation of, in urine (METHUEN), A., ii, 1136.
 estimation of, in hard water (NEE NAGEL), A., ii, 1031.
 estimation of, physico-chemically, in wine (DUBOCH), A., ii, 225.
 separation of barium, strontium and (HORN VAN DEN BOS), A., ii, 770.
 (BIENBRAUER), A., ii, 770.
 separation of, from magnesium (MANN), A., ii, 440.
 separation of strontium from barium and (MACHIEDO), A., ii, 459.
 (HINDS), A., ii, 440.
Calcitric, constituents of (BAKER and SMITH), A., i, 478.

- Callitrol (BAKER and SMITH), A., i, 475.
- Callose, detection of (TAVERT, A., ii, 945).
- o*-Calyxanthine, salts of a quaternary base from (GORDIN), A., i, 903.
- Camphane, dinitro- (HENDERSON and HILLERON), T., 1899; P., 249.
- o*-Camphane (LIPP), A., i, 731.
- Camphane series, studies in the (FORSTER and ZIMMERLI), T., 478; P., 50; FORSTER, TROTTER, and WEINTROUBE, T., 1982; P., 259; (FORSTER and WIHNER), P., 327.
- Camphasethiotriazine (FORSTER and ZIMMERLI), T., 489; P., 50.
- Camphemic acid, and bromo-, and hydroxy-, and their salts and derivatives (HENDERSON and SUTHERLAND), T., 1543; P., 211, 278.
- Camphene, constitution of (HENDERSON and HILLERON), T., 1901; P., 249; (ASCHAN), A., i, 794, 796, 797.
- oxidation of (HENDERSON and SUTHERLAND), T., 1541; P., 211; (KOMPPA), A., i, 388.
- Camphenephosphinic acid, sodium salts, physiological action of (GARISON and SYDGE), A., ii, 314.
- trans*-*o*-Camphemic acid and its diamide (ASCHAN), A., i, 797.
- Camphenilaldehyde semicarbazone (LIPP), A., i, 732.
- o*-Camphenilaldehyde and its semicarbazone (HENDERSON and SUTHERLAND), T., 1546; P., 211.
- o*-Camphenilanic acid, bromo-, and its derivatives (HENDERSON and HILLERON), T., 1894; P., 249.
- Camphenylnitroamine. See Camphor, pernitroso.
- Campholactone, constitution of (BREIT), A., i, 417.
- o*-Campholactone, amino-, hydroxyl-, amino-, and nitro-, and their salts and derivatives (NOYES and HOMBERGER), A., i, 110.
- o*-Camphollic acid, bromo-, and cyano- (KOMPPA), A., i, 642.
- o*-Campholide (KOMPPA), A., i, 642.
- o*-Campholytic acid, constitution of (BREIT and MARREN), A., i, 416.
- Camphor, specific rotation of, in acetone solution (MALOISE), A., i, 730.
- influence of water on the rotatory power of, in solution (Y. KAZAY), A., i, 892.
- transformation of borneol into, and its hydrogenation (ALOV and BRUSTIER), A., i, 730.
- derivatives of (MARREN), P., 283.
- analysis of (LENZ), A., ii, 665.
- Camphor, estimation of, in smokeless powders (MARQUETROL), A., ii, 774.
- Camphor, chloro-, and its semicarbazone (HENDERSON and HILLERON), T., 1895; P., 248.
- pernitroso-, (*camphenylnitroamine*), constitution and derivatives of (FORSTER, TROTTER, and WEINTROUBE), T., 1982; P., 259.
- β*-Camphor (*bornylone*), synthesis of, and β-imino (BREIT and HILMING), A., i, 657.
- o*-Camphor, pernitroso- (CASTELLANA and FIGUEROA), A., i, 217.
- Camphor series, molecular rearrangements in the (NOYES and HOMBERGER; NOYES and KNIGHT), A., i, 110, 111.
- Camphor wood, false, oil from (SEMMLER and ZACK), A., i, 388.
- β*-Camphoramic acid (NOYES and KNIGHT), A., i, 111.
- Camphorbenzoylhydrazones (FORSTER, TROTTER, and WEINTROUBE), T., 1992.
- Camphorcarboxylic acid, dithio-, and its methyl ester and copper salt (TSCHUGOFF and PODOLEWSKY), A., i, 797.
- Camphoric acid, synthesis of (KOMPPA), T., 29; (BLANC and THURPE), T., 2910; P., 265.
- salts of (HILDECHT), T., 236.
- iso*-Camphoric acid, methyl ester of (NOYES and KNIGHT), A., i, 111.
- Camphoroxalic acid, dibenzylamine salt and other derivatives of (TINGER and BATES), A., i, 55.
- Camphorquinone and pernitroso-, phenylhydrazones and *p*-bromo- and *p*-nitrophenylhydrazones of, and their derivatives (FORSTER, TROTTER, and WEINTROUBE), T., 1985.
- absorption spectra of the hydrazones and semicarbazones of (LANKSHEAR and LARWORTH), T., 1785; P., 224.
- α*- and *β*-phenylhydrazones of *α*- and *β*-thiosemicarbazones of (FORSTER and ZIMMERLI), T., 483; P., 50.
- benzoyl derivative of the phenylhydrazones of (AFWEERS, DANNEN, and BOENNEKE), A., i, 171.
- Camphorquinoneoxime, pernitroso-, and its benzoyl derivative (FORSTER, TROTTER, and WEINTROUBE), T., 1989.
- Camphorquinonephenylthiocarbonylhydrazones (FORSTER and ZIMMERLI), T., 490; P., 50.
- Camphorsulphonic acid, yttrium salt (PRATT and JAMES), A., ii, 893.

- 2-Camphorsulphonic acid, α -*p*-hydroxy**, optically active phenylethylamine salts of, and their benzoyl derivatives (MOORE), T., 419; P., 42.
- d*- and *l*-Camphorsulphonic acids, bromo-**, *d*- and *l*-narcotine salts of (PERKIN and ROBINSON), T., 788.
- d*- and *l*- β -Camphorsulphonic acids**, *l*-menthyl esters of (Tschugakoff), A., ii, 787.
- Campher- γ -sulphonic acid**, salts of (HILDITCH), T., 236.
- Campher- β -thiosulphonic acid** and its sodium salt and anhydride (HILDITCH), A., i, 892.
- Camphorylideneacyanoacetic acid** and its esters (FORSTER and WITHERS), P., 327.
- Camphylidenehydrazine** and its hydrochloride (KIJNER), A., i, 679.
- Canal rays**. See under Photochemistry.
- Cancer**, peptide-splitting ferments of gastric contents in (HALL and WILLIAMSON), A., ii, 310.
- Cancrinite**, chemistry of (THERUTT), A., ii, 298.
- Cantharidin**, estimation of, in cantharides (EMDE), A., ii, 669.
- Caoutchouc**, chemistry of (SPENCE and SCOTT), A., i, 801.
- Pára**, carbohydrate constituents of (PICKLES and WHITFIELD), P., 54.
- synthetic**, preparation of (HARRIES), A., i, 798.
- preparation of substances resembling** (FARBENFABRIKEN VORM. F. BAYER & Co.), A., i, 1003.
- absorption of gases by** (REYCHLER), A., ii, 19.
- action of chromyl chloride on** (SPENCE and GALLETTLY), A., i, 314.
- action of, on antiseptic mercury solutions** (GLENNY and WALFORD), A., ii, 141.
- vulcanisation of** (BYSOFF), A., i, 314, 390; (HINRICHSSEN), A., i, 550; (SPENCE and SCOTT), A., i, 657.
- action of sulphur on the vulcanisation of** (BARY and WEYDERT), A., i, 1003.
- nitrosites of** (ALEXANDER), A., i, 389.
- estimation of** (HINRICHSSEN and KINDSCHER), A., ii, 445; (KORNECK: BUDDE: FENDLER: HARRIES: BECKER), A., ii, 545; (SPENCE, GALLETTLY, and SCOTT), A., ii, 1035; (HÜBENER: BECKER), A., ii, 1036.
- estimation of, in vulcanised rubber materials** (HÜBENER), A., ii, 281.
- vulcanised**, assay of (ESCH), A., ii, 946.
- Caoutchouc-seed oil**, Pára, composition of (PICKLES and HAYWORTH), A., i, 1024.
- Capillary analysis**. See under Analysis.
- Capillary-chemical problems**, discussion of (v. WEIMARN), A., i, 279.
- Capocalcin**, extraction of (NELSON), A., i, 551.

Carbon, anode. See **Anode** under **Electrochemistry**.

melting of (WATTS and MENDELHALL), A., ii, 881.

cementation of iron by (CHARPY and BONNEROT), A., ii, 1091.

solubility of, in iron (RUFF and GÖECKE; RUFF), A., ii, 897.

action of, on chromyl chloride (RONRIGUEZ MORENO and GARCIA BANUS), A., ii, 731.

and lime, action of steam on a mixture of (VIGNON), A., ii, 391.

and nitrogen, gaseous compounds of (LIDOFF), A., i, 429.

assimilation of, by plants (MACQUEEN), A., ii, 761.

Carbon alloys with iron (RIEGER and ILIEN), A., ii, 494; (GONZMANN), A., ii, 1091.

precipitation of carbon from (HATFIELD), A., ii, 401.

and chromium (ARNOLD and READ), A., ii, 1092.

Carbon tetrabromide, action of, on organic bases (DEHN and DEWEY), A., i, 914.

tetrachloride, specific heat of, and of its saturated vapour (MILLS and MACRAE), A., ii, 180.

monoxide, spectrum of (WOLTER), A., ii, 878.

effect of temperature on the dissociation equilibrium of (RHEAD and WHEELER), T., 1140; P., 126.

formation of hydrocarbons from (VIGNON), A., i, 101.

photochemical and thermal reaction of chlorine with (CHAPMAN and GEE), T., 1728; P., 56, 223.

detection of, by means of blood (FRANZEN and v. MAYER), A., ii, 1029.

detection of, in tissues after death (DE DOMINICIS), A., ii, 439.

dioxide, amount of, in the atmosphere at Monte Video (SCHRÖDER), A., ii, 1086.

ultra-red absorption spectrum of (HERTZ), A., ii, 830.

apparatus for the generation of (PUERMANN and VERBEEK), A., ii, 878.

solubility of, in beer (FINDLAY and SHEN), T., 1313; P., 189.

alkaline-earth carbonates and water, equilibrium between (McCOR and SMITH), A., ii, 380.

equilibrium of condensation of nitrobenzene with (KOHSTAMM and REEDERS), A., ii, 1077.

Carbon dioxide, and methyl alcohol, fusibility of mixtures of (BAUMANN and KOT), A., ii, 696.

behaviour of, in the electric field (MUTHMANN and SCHMIDT), A., ii, 790.

role of, in bleaching process (HIGGINS), T., 858; P., 22.

action of, on bleaching process (TAYLOR), T., 1908; P., 24.

absorption of, by caoutchouc and blood charcoal (REYMER), A., ii, 19.

pyrogenic reactions of, with disulphide and hydrogen (MEYER and SCHUSTER), A., 721.

output of, during decomposition (ROAF), A., ii, 503.

assimilation of, by green plants (GRAFE), A., ii, 521.

estimation of expired (BROOK and HOMANS), A., ii, 100.

estimation of, in expired air of town and country (TAYLOR), A., ii, 408.

estimation of, in water (TAYLOR and HEUBLEIN), A., ii, 100.

Carbonic acid, alumin salts of (MILLER, CHININFABRIKES, ZIEGLER and Co.), A., i, 480.

effect of heat on mixed carbonates (EINBORN and ROTHMANN), A., 703.

alkyl aryl esters of (EINBORN and SEIFFERT), A., i, 54.

2,6-dibromo-4-nitro-*o*-tolyl ester (RAIFORD), A., i, 293.

chlorotolyl esters of (RASHBURN), i, 636.

p-nitrophenyl ethyl ester (RASHBURN and NIERENSTEIN), A., i, 637.

Carbonic acid, dithio-, dimethoxy phosphorescence of (HELMGOLD and CAMPO Y CORDAN), A., i, 100.

isomeric hydrazones of carbon esters of (BUSCH and KLEIN), i, 811.

trithio-, phenyl ester (CANDLER), A., i, 197.

Carbonates, alkalinity of aqueous solutions of (AUERBACH and FRIEDL), A., ii, 1078.

fusion of, with sodium paracetamol (GOOCH and KUZIRIAN), A., 657.

Carbon disulphide, action of, on amino-acids (SIEGFRIED and DENHAUPT), A., i, 116.

nitrogen and sulphur derivatives (DELEPINE), A., i, 23, 944.

- Carbon disulphide, pyrogenic reactions of carbon dioxide with, and hydrogen sulphide (MEYER and SCHUSTER), A., ii, 721.
telluride (STROCK and BLEMENTHAL), A., ii, 722.
- Carbon, apparatus for estimating, in iron (BUTZBACH and FENNER), A., ii, 957.
estimation of, in iron alloys (STAUFELER), A., ii, 538.
estimation of, in iron and steel (WENNEMANN), A., ii, 1026; (AUGUSTIN), A., ii, 1029.
estimation of, in organic compounds (FRANKLAND), P., 309.
estimation of, in steel (MAHLER and GOUTAL; DE NOLLY), A., ii, 937.
estimation of, in organic compounds (FRANKLAND), T., 1783; P., 207; (FANGEL and V. KERESZTV), A., ii, 538.

- Cerous thallous nitrate (JANTSCH and WEIDENROW), A., ii, 115.
- Cerium sulphate, crystallography of the tetrahydrate of (ROSATI), A., ii, 984.

Cerium alkali sulphates (BARRR), A., ii, 42.

decomposition of (BROWNING and BLUMENTHAL), A., ii, 890.

Cerium, separation of (ROBERTS), A., ii, 541; (JAMES and PRATT), A., ii, 935.

Cerotene and its oxime (EASTERFIELD and TAYLOR), T., 2302; P., 279.

Cetyl cyanide. See Heptadecanitrile.

β -Cetyl- β -glucoside and its tetra-acetyl derivative (FISCHER and HELFERICH), A., i, 802.

Chabasite (SMITH), A., ii, 501.

Chalcodony, specific heat of (LASCHTSCHENKO), A., ii, 253.

Chalk waters. See under Water.

Champaca oil, constituents of (BROOKS), A., i, 1000.

Charcoal, absorption of iodine by (CORRIG), A., ii, 1083.

absorption of substances by (FREUNDLICH and MASSE), A., ii, 374.

blood, absorption of gases by (REYNOLDS), A., ii, 19.

absorption of methylene-blue and crystal ponceau by (PELLET-LIVET and SIEGHE), A., ii, 374.

decolorising action of (KNECHT), A., ii, 471.

Cheese, transformation of proteins into fats during the ripening of (NIEBENSTEIN), A., ii, 326.

tyrosine crystals in (DOVE), A., ii, 429.

***Cheiranthus cheiri* (wallflower), oil from** (KUMMERT), A., i, 658.

***Chelone imbricata*, constituents of the shield of** (BROTHAL), A., ii, 1009.

Chemical action. See under Affinity, chemical.

compounds, spectroscopic evidence for the formation of (RUFF), A., ii, 237.

properties of (KRIEHOFF), A., ii, 873.

relation between the physical properties of, and the chemical attraction in their molecules (MARTIN), A., ii, 793.

relation between the physical properties of, with special reference to their densities (TER-GAZARIAN), A., ii, 1066.

reactions between, and living muscle-proteins (VELEV), T., 180; P., 3.

constitution, use of the magnetic field in determining (PASCAL), A., ii, 91, 183, 251, 252, 464, 850, 1058.

determination of by optical methods (AUWERS and EISENLOHR), A., ii, 781, 782.

Chemical constitution and absorption spectra, relation between (CHAMBERLAIN, STEWART, WILSON, and GLEDENNING), T., 451; P., 444 and colour (PAWLEWSKI), A., ii, 480.

and hypnotic action (REYNOLDS), T., 610; P., 72.

and optical activity (REYNOLDS), T., 538; P., 46.

and physiological activity, relation between (EMMER), A., ii, 515 (HUTTENRER), A., ii, 515.

relation between, and reactivity of nitrogen compounds (CHAMBERLAIN), T., 1927; P., 243.

and rotatory power (PICKERING and KENYON), T., 45; P., 324.

and specific gravity (EMMER), A., ii, 17.

relation of the velocity of the reaction of aromatic compounds (ORTON and KING), T., 1069, 1377; P., 196.

reactions, electrical induction of (WINSTON), A., ii, 692.

production of ions during (REYNOLDS), A., ii, 692.

Chemistry, forensic, recent advances in (DENNSTEDT), A., ii, 221.

theoretical, arbitrary distinction in (MALETTANO), A., ii, 377.

***Chenopodium*, constituents of the** (NELSON), A., i, 797.

Cherry-laurel water, composition of (WIRTH), A., i, 875.

loss of hydrocyanic acid from (REYNOLDS), A., ii, 921.

Chestnut flour, constituents of (MARTINI), A., ii, 1023.

Chicory. See *Cichorium intybus*.

Children, sleeping, energy changes in (HOWLAND), A., ii, 1005.

Chitin, formation of levulinic acid from (HAMBURGER), A., i, 834.

Chitose, formation of levulinic acid from (HAMBURGER), A., i, 834.

Chloral, compounds of, with acids (CHEMISCHE FABRIK GEBENBROTTER), A., i, 836.

chloroacetate (GABUTTI), A., i, 943.

assay of (BOURDET), A., ii, 943.

Chloralhydrate (KNOPFER), A., ii, 943.

Chloralose, dichloro- and other derivatives of (HANRIOT and KLING), A., i, 524.

Chloraloses, action of alkalis on (HANRIOT and KLING), A., i, 524, 525.

Chloralexime, decomposition of with alkali hydroxide (PALAZZO and FANTUZZI), A., i, 421.

Chlorhydrates, and its derivatives (JELLS and GUKANSKY), A., i, 24.

Chloropaths (CAMERON and McCARTHERY), A., ii, 734.

Chlorates. See under Chlorine.

Chlorides. See under Chlorine.

Chlorination, new method of (ORTON and KING), T., 1185; P., 139.

(Aromatic compounds, relation of the velocity of, to constitution (ORTON and KING), T., 1369, 1377; P., 196.

Chlorine, amount of, in the animal body and in the human fetus (ROSE-MANN), A., ii, 1110.

atomic weight of, determined by electrolytic methods (GOLDBAUM), A., ii, 271.

action of light on (KUMMELL), A., ii, 796.

magneto optical effects of (HEERKING), A., ii, 963.

electrode potentials in the manufacture of (SACERDOTI), A., ii, 789.

flame, electrical and optical behaviour of the (FRANCK and PRINGSHEIM), A., ii, 674.

equilibrium of, with ether (McNOSH), A., i, 256.

calorimetric experiments with (ENGERICH and STANIEWSKI), A., ii, 16.

electrode. See Electrode under Electrochemistry.

photochemical and thermal reaction of, with carbon monoxide (CHAPMAN and GKE), T., 1726; P., 53, 223.

action of, on alkalis (TAYLOR), T., 1906; P., 243.

action of, on phenols (ZINCKE, FROHNBERG, and KEMPF), A., i, 439.

Hydrochloric acid, conductivity of, and of its mixtures with sodium chloride (BRAY and HUNT), A., ii, 688.

temperature-coefficient of the electrical conductivity of, in alcoholic solution (PARTINGTON), T., 1937; P., 247.

equilibrium of, with methyl alcohol (BAUME and FAMIL), A., i, 414.

equilibrium of the reaction of *p*-benzoquinone with (SCHMIDLIN), A., i, 727.

Chlorides, anhydrous, preparation of (CHAUVENET), A., ii, 109.

precipitation of, by hydrochloric acid (GIBSON and DENISON), A., ii, 203.

estimation of, in blood (OPPLER), A., ii, 150.

Chlorine:—

Chlorides, estimation of, in commercial bromides (RABE), A., ii, 765.

estimation of, in presence of bromides (HEETING), A., ii, 435.

estimation of, in presence of chlorates and perchlorates (MARQUEV-ROU), A., ii, 652.

Chlorates, theory of the formation of (MULLER and KOPPE), A., ii, 797.

estimation of, in presence of chlorides and perchlorates (MARQUEV-ROU), A., ii, 652.

Perchlorates, estimation of, in presence of chlorides and chlorates (MARQUEV-ROU), A., ii, 652.

Hypochlorous acid, action of, on ethylene hydrocarbons (USOVA), A., i, 249.

Chlorine, estimation of, in presence of hydrochloric acid (BOLGER and GRANTHER), A., ii, 435.

estimation of, in potable water (SILARI), A., ii, 929.

estimation of, in serum (RUNA), A., ii, 126.

estimation of, in rain water (WITVYNJ), A., ii, 432.

Chlorocarbonic acid, ethyl ester, action of magnesium and aliphatic halogen derivatives on (MATSCHEK-VITICH), A., i, 257.

action of, on sodium derivatives of ketones (HALLER and BAUER), A., i, 239.

Chloroacetic acid, occurrence of *p*-methoxy-subaldehyde in a species of (GORTING and PELLY), P., 235.

Chloro ethers (OIRO and USMANO), A., i, 912, 913.

Chloroform, action of, on blood-vessels (CAMERON), A., ii, 738.

influence of, on phagocytosis (HAMBOCK, DE HAAN, and BYRANOVIC), A., ii, 504.

effect of, on protein metabolism of the dog (LINSAY), A., ii, 303.

reflex action under (SHERRINGTON and SAWYER), A., ii, 753.

Chloroimino ketones, stereoisomeric (PETERSON), A., i, 879.

Chloromorphides, physiological action of (HAENACK and HILDEBRANDT), A., ii, 516.

Chlorophyll (WILLSTATTER and OPPÉ), A., i, 140; (WILLSTATTER and STOLL), A., i, 141, 391; (WILLSTATTER, MAYER, and HUNT), A., i, 141; (WILLSTATTER and ISLER), A., i, 392; (WILLSTATTER and HUO), A., i, 393; (WILLSTATTER and UZINGER), A., i, 659.

- Chlorophyll, formation of, in plants** (MONTVERDE and LURIMENKO), A., ii, 424.
- action of light on** (DANGEARD), A., ii, 86.
- action of ultra-violet light on solutions of** (BIRREY and LAROUQUE DES BANCHE), A., i, 735.
- crystalline** (TAVETT), A., i, 74.
- alloChlorophyll, chemical nature of** (MARCHEWSKI and MARZALEK), A., i, 735.
- Chlorophyll group** (MARCHEWSKI and ROBEL), A., i, 552, 735; (MARCHEWSKI, MARZALEK, and LEYKO), A., i, 896.
- Chlorophyllan** (TAVETT), A., i, 395.
- Chlorophyllans** (MARCHEWSKI), A., i, 553.
- Chlorophyllase** (WILLSTÄTTER and STOLL), A., i, 142.
- Chlorophyllide** (WILLSTÄTTER and STOLL), A., i, 143.
- isoChlorophyllia** (WILLSTÄTTER and UTZINGER), A., i, 661.
- Chlorophyllins, solubility and isolation of** (TAVETT), A., i, 553.
- Chloropodiosite** (CAMERON and McCAGHER), A., ii, 734.
- Chelagogues, aromatic compounds as** (PETROWA), A., ii, 1010.
- Cholesterol, from the skull of an Egyptian mummy** (ABDERHALDEN), A., ii, 1006.
- in petroleum** (KOSK), A., i, 701.
- isolation of, from brain** (SMITH and MAIR), A., i, 44.
- and its esters, resorption of** (KLEIN and MAGNUS-LEVY), A., ii, 57.
- compound of, with diosceine** (YAGI), A., i, 140.
- compounds of, with fatty acids** (PARKINGTON), T., 313; P., 14.
- antagonism of, to the glucosidic heart poisons** (KARA'LOW), A., ii, 517.
- effect of glycerol on the clearing point of** (SMITH and MAIR), A., i, 44.
- inhibition of the irritating action of oleic acid by** (LAMP), A., ii, 52.
- relations of, and the phytosterols** (SALKOWSKI), A., i, 45.
- production of uric acid from, in the liver** (TRAETTA-MOSCA and APOLLONI: TRAETTA-MOSCA and MIZZENMACHER), A., ii, 52.
- fate of, in the animal organism** (BROWINSKI), A., ii, 305.
- pharmacology of acids produced by oxidation of** (FLURY), A., ii, 1119.
- and its derivatives, action of, in the syphilis reaction** (BROWNING and CRICKSHANK), A., ii, 1014, 1118.
- Cholesterol, iodo-fat derivatives, behaviour of, in the body** (BALDEN and GRESSEL), A., ii, 305.
- estimation of, in tissues** (LAWSON), A., ii, 305.
- Cholesterol, α -, and β -iodo-, derivatives, and di-iodo-, derivative** (ABDERHALDEN and GUTHE), A., ii, 1015.
- Cholesterols in soils** (SCHREINER and SHOREY), A., ii, 327.
- Cholesteryl ethers, preparation of** (BLUMBERG and STREINKE), A., i, 971.
- Cholesterylamine and its salts, derivatives** (WINDAUS and ADAMLA), A., i, 961.
- Cholesterylurethane** (WINDAUS and ADAMLA), A., i, 961.
- Cholla acid** (SCHENCK), A., i, 10.
- cotarnine salt of** (FRAUND), A., ii, 1005.
- Cholina in ox-brain** (KAEFFMANN), A., ii, 1005.
- action of, on blood-pressure** (ABDERHALDEN and MÜLLER), A., ii, 997.
- Chondrodine and its salts and derivatives** (SCHOLTZ), A., i, 913.
- Chorda tympani, effect of drugs on the action of the** (DALE and LAMDAV), A., ii, 997.
- Choroid glands, function of** (KRAMER), A., ii, 1006.
- Chrome iron ore, estimation of chromium in** (NYDEGGER), A., ii, 773.
- Chromic acid. See under Chromium.**
- Chromite, from the Marjalsittum** (BOGSTRÖM), A., ii, 120.
- Chromium, refraction and absorption of** (FREDERICKSZ), A., ii, 349.
- complex salts of, with ammonia** (TSCHUGAEFF and SERBIN), A., 115.
- basic acetate of** (GUSSMANN), A., 103.
- Chromium alloys with iron, resistance to acids** (MONNARTZ), A., ii, 54.
- with iron and carbon** (ARNOLD and READ), A., ii, 1092.
- Chromium compounds, effect of, on plas** (KOENIG), A., ii, 524.
- Chromium salts as disinfectants in plas** (KOENIG), A., ii, 311.
- Chromium trioxide, solubility of in water** (KREMMANN, DAIMER, and BENNESCH), A., ii, 898.
- Chromic acid, salts of, with pygan acid** (WEINLAND and HORN), A., i, 104.
- Chromous chlorides, isomeric** (KNOX and RICH), T., 87.
- Chromyl acetate, bromide and chloride, preparation of** (FRY), A., ii, 612.

Chromes chlorides:—

Chromyl chloride, action of, on india-rubber (SPENCE and GALLETT), A., i, 314.

action of carbon on (RODRIGUEZ MOURIEL and GARCIA BARRA), A., ii, 731.

compound of, with bornylene (HENDRICKSON and HEILBRON), T., 1891; P., 248.

Chromic sulphates, ionisation of (COLSON), A., ii, 1096.

Chromium, detection of (KÖNIG), A., ii, 337.

detection of, in steel (STANKE), A., ii, 443.

estimation of, in chrome iron ore (SVENSSON), A., ii, 773.

estimation of, in steel (HINRICHSSEN and DIECKMANN), A., ii, 156; (WŁODZIMIRSKI and BOGOLUBOFF), A., ii, 157.

separation of iron, and aluminium (TCHARVIANI and WUNDER), A., ii, 156; (SCHIRM), A., ii, 936.

chromium ammine salts (WERNER), A., i, 951.

chromium steel (PORTEVIN), A., ii, 805.

concentration of (GIOLITI and CARNEVALI), A., ii, 728.

chromotelluric acid, salts of (HERZ), A., ii, 611.

chromyl salts. See under Chromium.

chromine dimethyl ether (FARBENFABRIKEN VORM. F. BAYER & CO.), A., i, 469.

chromene, synthesis of (BESCHKE, WINOGRAD-FINKEL and KÖRNER), A., i, 873.

chromene, 2:8-dihydroxy-, and its derivatives (BESCHKE, WINOGRAD-FINKEL, and KÖRNER), A., i, 874.

2:2,8-trihydroxy- (BESCHKE and DIEMM), A., i, 890.

chromocrotylic acid and its sodium salt (LIEBERMANN and ZUFFA), A., 202.

chromocolla from Chili (KELLER), A., ii, 104.

chromofluorene, identity of, with hydrobenzanthrene (SCHOLL and KER), A., i, 626.

chromonic acid (FISCHER, FAUCH, and GROSS), A., i, 309.

reparation of, and its derivatives (FISCHER and GROSS), A., i, 886.

bein, and aloecodin, relation between (OSTERLE), A., i, 887.

and its dibenzoyl derivative (TUTIN and CLEWER), T., 955; P., 89.

methyl ether, salts of (FISCHER, GROSS, and NEBER), A., i, 887.

1:2-Chrysophenazine, 8-hydroxy-, and its derivatives (BESCHKE and DIEMM), A., i, 890.

1:3-Chrysoquinone, 8-hydroxy-, and its derivatives (BESCHKE and DIEMM), A., i, 889.

2:8- or *amph*: Chrysoquinone and its bisulphite compound (BESCHKE and DIEMM), A., i, 889.

1:2-Chrysoquinone-1-anil-, 8-hydroxy-, and its derivatives (BESCHKE and DIEMM), A., i, 889.

Chymosin. See Rennin.

Cichorium intybus, colour changes in the blue flowers of (KASTLE and HADEN), A., ii, 1023.

Ciders, the greenness of (KAYSER), A., ii, 648, 759.

Cincholapona derivatives, synthesis of (WOHL and MAAG), A., i, 24.

Cinchomaronic acid, betaine of (KIRPAL), A., i, 157.

Cinchona alkaloids (RABF and MARSCHALL: RABF and MILARCH), A., i, 741; (RABF), A., i, 742.

action of magnesium organic compounds on (DINRO), A., i, 453.

Cinchona bark, estimation of quinine and alkaloids in (VIGNERON), A., ii, 234.

Cinchonamine hydrochloride, action of on frog's nerves (ELLISON), A., ii, 906.

Cinchonic acid, synthesis of (KAUFMANN, WIDNER, and ALBERTINI), A., i, 749.

Cinchonidine, acetyl, benzoyl and benzenesulphonyl derivatives of (HILDEITCH), T., 238.

hydrochloride, double salt of, with antimony pentachloride (THOMSEN), A., i, 484.

iso-Cinchonidine and its salts (PANETH), A., i, 561.

Cinchonine, partial synthesis of (RABF), A., i, 742.

and its isomerides absorption spectra of (DORR and LAUDER), T., 1254; P., 148.

action of sulphuric acid on (PANETH), A., i, 560.

acetyl, benzoyl and benzenesulphonyl derivatives of (HILDEITCH), T., 238.

hydrochloride, double salt of, with antimony pentachloride (THOMSEN), A., i, 484.

benzaldehyde sulphite (MAYKE), A., i, 221.

Cinchotaxine, N-bromo- (RABF), A., i, 742.

Cineole, fate of, in the organism (HAMALAINEN), A., ii, 137.

Cinnamaldehyde-p-methoxyphenylhydrazones (PAIRO and SANTI), A., i, 1029.

- Cinnamic acid**, optically active, from stovur-cinnamic acid (ERLENMEYER and HILKENDORFF), A., i, 781, 785, 788; (ERLENMEYER), A., i, 782.
- isomerides of (ERLENMEYER), A., i, 721.
- and its esters, complex compounds of mercury with (SCHRAUTH, SCHOELLER, and STRUENKE), A., i, 595.
- ethylone and glycerol esters of (FARBENFABRIKEN VORM. F. BAYER & Co.), A., i, 858.
- d*-methylhexylcarbonyl ester of (HILKENDORFF), T., 222; P., 6.
- dl*-, *a*-, and *l*-*β*-octyl esters of (PICKARD and KENYON), T., 67.
- Cinnamic acid**, *o*-amino-, acetyl derivative, *m*-amino-, acetate, and *o*- and *p*-hydroxy-, esters of (POSNER), A., i, 53.
- a*-amino-3:4-dihydroxy-, benzoyl derivative and its lactonide (FUNK), T., 555.
- β*-chloro-, and its derivatives (JAMES), T., 1620; P., 216.
- 3:4-dihydroxy-, methyl ester (POWER and ROGERSON), P., 304.
- o*-iodo-, methyl ester (MAVER), A., i, 870.
- a*-thio- (HINBERG), A., ii, 874.
- alloyCinnamic acid**, action of sunlight on (DE JONG), A., i, 639.
- alloyCinnamic acid**, *o*-chloro-, and its derivatives (STOERMER, FRIDERICH, BRACHTAGAM, and NECKEL), A., i, 297.
- β*-chloro-, and its derivatives (JAMES), T., 1620; P., 216.
- cis-Cinnamic acid**, transformations of (KRUYT), A., i, 975.
- Cinnamic acids**, substituted, preparation of (POSNER), A., i, 52.
- alloyCinnamic acids**, isomerism of (MEYER), A., i, 975.
- alloy- and iso-Cinnamic acids**, refraction of light by (STORBE and REUSS), A., i, 859.
- transformations of (STORBE), A., i, 859.
- Cinnamic *o*-cinnamoyloxybenzoic anhydride** (EINHORN and SEIFFERT), A., i, 54.
- Cinnamoyl**, *a*-bromo-, bromide (STALDINGER and OTT), A., i, 639.
- Cinnamoyl *p*-aminoacetophenone** (REMFRY), T., 625; P., 72.
- Cinnamoylcarbamio acid**, ethyl ester, preparation of (REMFRY), T., 624.
- 2-Cinnamoylaminobenziminazole** (PIERSON), A., i, 166.
- Cinnamoylhydrazide** and its derivatives (MUCKERMANN), A., i, 682.
- 2-Cinnamoyl-*a*-naphthol**, 4-nitro-, and 2-*m*-nitro- (TORREY and CARDARELLI), A., i, 682.
- o*-Cinnamoyloxybenzoic anhydride** (EINHORN and SEIFFERT), A., i, 54.
- Cinnamoylphenylguanidine** (PIERSON), A., i, 166.
- Cinnamoylphenylthiosemicarbazide** (MUCKERMANN), A., i, 682.
- Cinnamoylsemicarbazide** (MUCKERMANN), A., i, 682.
- Cinnamylidethyllallylammonium** and platinumchloride (EMDE and SCHELLBACH), A., i, 282.
- Cinnamylidethyllamine** and platinumchloride (EMDE and SCHELLBACH), A., i, 282.
- Cinnamylidene esters**, reaction of magnesium organic compounds (EINHORN), A., i, 860.
- Cinnamylideneacetic acid**, addition of hydrogen bromide to (RIEGER), A., i, 979.
- isopropyl ester (AUWERS and EISENHART), A., ii, 784.
- a*-cyano-, esters, action of light (REIMERS), A., i, 447.
- all-Cinnamylideneacetic acid**, oxidation of (RIEGER), A., i, 860.
- methyl ester (REYNOLDS), A., i, 861.
- Cinnamylideneacetophenone**, action of light on (STORBE and RUCKER), A., i, 385.
- iso-Cinnamylideneacetophenone** (STORBE and RUCKER), A., i, 385.
- 4-Cinnamylideneamino-2-acetyl-*n*-aphthol** (TORREY and CARDARELLI), A., i, 682.
- 3-Cinnamylideneamino-2-methyl-4-azulone** (BOBERT, BELL, and AVER), A., i, 163.
- Cinnamylidenemalonio acid**, addition of hydrogen bromide to (RIEGER), A., i, 979.
- ethyl ester (AUWERS and EISENHART), A., ii, 784.
- Citraconic acid**, ethyl ester, oxidation of, with ethyl sodium (HOPE), P., 231.
- enol-Citral acetate** (SEMMLER and SCHLOSSBERGER), A., i, 475.
- Citric acid**, fermentation of, in milk (BOSWORTH and PRITCHARD), A., i, 318.
- oxidation of, by animal (BATTIELLI and SIERN), A., i, 475.
- ammonium salt, preparation of neutral solution of (BATTIELLI), A., ii, 657.
- compounds of, with alkalies (QUARTAROLI), A., ii, 475.
- basic barium salts of (QUARTAROLI), A., i, 176.
- estimation of, in milk (DESMOULIER), A., ii, 548.

- Citronella grass oil** (SCHIMMEL & Co.), A. i, 476.
- Citronellal oxide and its derivatives** (FEILSCHAEFF), A. i, 604.
- Citronellalnitride, derivatives of** (WALLACH and HENRI), A. i, 313.
- Citrophosphate solutions** (PRATOLONGO), A. ii, 465.
- Cladonic acid** (HOSER), A. i, 209.
- Claviceps** (MARINO-ZUCCO and PASQUALE), A. i, 1003. •
- Climateology, physiological** (OSBORNE), A. ii, 124.
- Caprine, nitro-** (KOSSEL and KANNAN), A. i, 667.
- Coal constituents of** (PICTET and RAMSEY), A. i, 351.
- Fatlike constituents of** (BURGESS and WHEELER), T. 649; P. 70; PORTER and OVIAT, A. ii, 201.
- Estimation of total sulphur in** (WARREN), A. ii, 436.
- Coal gas, radiation in explosions of air and** (DAVID), A. ii, 1046.
- Estimation of sulphur in** (BLAHL), A. ii, 534.
- Coal tar, pitch from, and its use in briquetting coal dust** (BERNUS), A. i, 271.
- Crotonolides from, action on green plants** (MIRANDE), A. ii, 223.
- Split, resolution of the spectral lines of, in the magnetic field** (RYBAK), A. ii, 1042.
- Electrochemistry of** (SCHULDBACH), A. ii, 13.
- From, the asymmetric** (WERNER), A. i, 838.
- Complex compounds of, with glyoximes** (TSCHUGAEFF), A. i, 261.
- Salt salts, absorption of light by** (HOUSTON; HOUSTON and BROWN, A. ii, 785; HOUSTON and ANDERSON), A. ii, 786.
- Magnetisation of** (WELSH and FOX), A. ii, 183.
- Malt hydroxo-nitrites, silver, strontium and zinc salts** (ROSENHEIM and GOFUNKEL), A. i, 619.
- Cobaltinitrites, complex** (ROSENHEIM and GOFUNKEL), A. i, 619.
- Cobaltamine salts** (WEENER), A. i, 838.
- Nitroso-, sensitiveness of, to light** (BURGER), P. 160.
- Reactions of stereoisomeric** (WERNER, KING, and SCHOLZE), A. i, 613.
- atecobaltic chloride, reaction of, with phosphates** (SEER), A. ii, 537.
- quo- and chloro-pentaminocobalt chlorides, equilibrium between** (PEIS), A. ii, 1094.

- Cyanates.** See under Cyanogen.
- α -Cyaniline** (KAUFMANN, SIECHIN, ANASTACHEWICH, POFFER, and SENAUER), A., i, 328.
- Cyanogen bromide**, condensation of hydrazole acid with (O'IVERI-MANDELA), A., i, 337.
halides, action of, on phenylhydrazine (PELLIZZARI), A., i, 338.
- Cyanogen compounds** in tobacco smoke (TÖTH), A., ii, 143.
estimation of (TÖTH), A., ii, 1127.
- Hydrocyanic acid**, content and distribution of, in the bamboo (WALTER, KRANONZSKAYA, MAKSIMOFF, and MALSCHEWSKY), A., ii, 525.
formation of, in the electric arc (LIPINSKI), A., ii, 849.
formation of, in the electric flame (MOSICKI), A., ii, 1057.
solutions of, in water (ROSENTHALER), A., i, 987.
and benzaldehyde, solutions of, in water (WIRTH), A., i, 875.
loss of, from cherry-laurel water (ASTRUC), A., ii, 921.
detection of, and its stability in the presence of decomposing matter (AUFENRIETH), A., ii, 78.
detection of traces of (LANDER and WALDEN), A., ii, 668.
- Cyanogen compounds:**—
- Cyanides**, estimation of (ROSENTHALER), A., ii, 668.
estimation of, volumetrically, in presence of ferrocyanides (TAKADWELL), A., ii, 827.
- Cyanates**, formation of, from nitrites (LIDOFF), A., i, 618.
oxidation of (LIDOFF), A., i, 618.
- Cyanogen**, estimation of compounds of, in coke oven gases (LEVOUQ), A., ii, 161.
- Cyanuric bromide**, and its derivatives (V. MEYER and NABE), A., i, 122.
- Cyanuric diamide**, bromide (V. MEYER and NABE), A., i, 122.
di-*p*-hydroxyamylide bromide (V. MEYER and NABE), A., i, 122.
tri-*n*-chloroamylide (*trichlorophenylmelamine*) (V. MEYER and NABE), A., i, 122.
tri-2,4-dichloroamylide (V. MEYER and NABE), A., i, 122.
tri-nitroamylide (*trinitrophenylmelamine*) (V. MEYER and NABE), A., i, 122.
- Cyanuric acid**, strontium salt of (BÖRNER and LANGENAUER), A., i, 22.
- Cyclic compounds**, absorption spectra of (CHYMEL, STEWART, WRIGHT, and REA), T., 1262; P., 153.
- Cypral** (ODOL), A., i, 549.
- Cypressene** (ODOL), A., i, 549.
- Cyst**, contents of a dermoid (SALKOWSKI), A., ii, 624.
- Cysteine** in animal organs (ARNOLD), A., ii, 396.
- Cytine**, oxidation of (DENIS), A., i, 616.
- Cytidine** and its salts (LEVERNE and JACOB), A., i, 96.
- Cytosine-5-acetic acid** and its picrate and hydrochloride (JOHNSON, PECK, and AMLER), A., i, 576.
- Cytosine-5-carboxylic acid**, 2-thio-. See 2-Thiopyrimidine-5-carboxylic acid, gamma.

D

- Dacrydene** and its derivatives (BAKER and SMITH), A., i, 479.
- Damascenic acid**, synthesis of (EWING), P., 277.
- Damar resins**, properties of (COFFIGNIE), A., i, 550.
- Datura**, active constituents of species of, from India (ANDREWS), T., 1871; P., 248.
- Datura metel**, alkaloids in the seeds of (SCHMIDT), A., ii, 143.
- Daturic acid**, methyl ester and magnesium salt of (MEYER and ECKERT), A., i, 106.

- Decamidation** (BOSTOCK), A., ii, 1112.
- Decacyclene** (PADOA), A., i, 362.
- α - and β -Decahydre- β -naphthel** (MASCARELLI), A., i, 965.
- Decamethyleneglycol, diethyl ether** (EGOROFF), A., i, 253.
- Decamethylene α - β -oxide** (EGOROFF), A., i, 253.
- Decane, α -dibromo-** (EGOROFF), A., i, 253.
- tet*rabromo-, α -dinitro-, and α -dioximino-** (v. BRAUN and SOBECKI), A., i, 631.
- Decane-10- γ -tetra-carboxylic acid and its ethyl ester** (HEMPRY), T., 623.
- Decylene oxide, glycol from, and its diacetyl derivative** (PRIEL-CHAEFF), A., i, 255.
- Didimethoxynarcotine and its salts** (HOPK and ROBINSON), T., 1168.
- Dehydroacetic acid, constitution of** (HALP), A., i, 721.
- Dehydration by means of ether** (STANÉK), A., ii, 269.
- Dehydrobulbocapsina methyl ether, salts of** (GADAMER and KUNTZE), A., i, 1012.
- Dehydrocamphanylic acid (*tricyclene*-acid), constitution of** (KOMPTA), A., i, 612.
- Dehydrogenation by catalysis** (ZELINSKY), A., i, 958.
- Dehydroindigotin, action of, with acids and alkalis** (KALB), A., i, 690.
- Dehydro- β -naphthol sulphide and its phenylhydrazones** (HILBITCH and SMILES), T., 981.
- De-N-methylbis-hydrocotarnine and its salts and derivatives** (FERNÉ and KUPFER), A., i, 911.
- De-N-methylisobis-hydrocotarnine and its salts** (FERNÉ and KUPFER), A., i, 911.
- Denitrification in the vegetable kingdom** (MAZE), A., ii, 518, 642.
- formation of oxides of nitrogen during** (SUZUKI), A., ii, 916; (LEBEDEFF), A., ii, 917.
- Density, relation between, refractivity, and magnetic rotation of solutions** (SCHWERS), A., ii, 92.
- and chemical constitution** (EARL), A., ii, 17.
- of gases, determination of** (JAQUERON and TOURPAÏAN), A., ii, 189.
- of homogeneous solids, determination of, by the "floating" method** (ANDREAE), A., ii, 469.
- of liquids, determination of the** (HARTLEY and BARRETT), T., 1072; P., 100.
- Deoxycholic acid, occurrence of, in gall stones** (KÜSTER), A., ii, 57.
- Deoxy-p-toluene, dibromo-** (KASTNER), A., i, 325.
- Depressimeter, automatic** (REICHER), A., ii, 93.
- Derria** (LENZ), A., ii, 646.
- Derria, constituents of species of** (LENZ), A., ii, 645.
- Destriacetic acid** (HESSZ), A., ii, 423.
- Dextrin, action of acids and alkalis on** (OECHSNER DE CHATEL and RAYNAUD), A., i, 423.
- action of hydrazide on** (OECHSNER DE CHATEL and RAYNAUD), A., i, 423.
- action of oxalic, lactic, and tartaric acids on** (OECHSNER DE CHATEL and RAYNAUD), A., i, 423.
- reactions of** (OECHSNER DE CHATEL and RAYNAUD), A., i, 181.
- Dextrins, formation of, from starch paste by bacilli** (SCHÄRINGER), A., i, 151.
- Dextrose, production of, from starch** (SCHÄRINGER), A., i, 151.
- digestion of cellulose** (SCHÄRINGER), A., i, 151.
- in eggs** (DIAMARE), A., ii, 121.
- in hens' eggs** (SALKOWSKI), A., ii, 121.
- mutarotation and electrical conductivity of** (KABZ and ROY), A., ii, 121.
- influence of sodium and potassium hydroxides on the optical behaviour of, in solution** (KABZ and ROY), A., ii, 121.
- densities of solutions of** (EYMON and LANE), A., ii, 121.
- proportion of, to levulose in preserved fruits** (FAYAT and GARNIER), A., ii, 1036.
- decomposition of, by dilute sulphuric acid** (OST and BRODKE), A., ii, 951.
- instability of, at the temperature of alkalinity of the body** (EYMON and LANE), A., ii, 121.
- destruction of, by light** (MATHIAS), A., ii, 423; (JOLLES), A., ii, 423.
- diffusion of, in presence of glucose** (RYWOSCH), A., ii, 815.
- action of barium hydroxide on** (RYWOSCH), A., ii, 423.
- permeability of blood capillaries** (RONA and DÖBLIN), A., ii, 423.
- selective power of vegetable cells** (LINDET), A., ii, 422.
- detection of, by Nylander's test** (GOLDSOBER and SONNENBERG), A., ii, 339.
- estimation of, colorimetrically** (AUTENRIETH and TROST), A., ii, 159.
- β -Dextrose, separation of** (RONA), A., i, 14.

- Dextrorosephenylhydrazones** and their derivatives (REHREND and REINSENG), A., i, 83.
- Diabetes** (*glycosuria*), experimental (MACLEOD and PEARCE), A., ii, 219, 1910; (FRANK and ISAAC), A., ii, 310.
- studies in (EDIE, MOORE, and ROAF), A., ii, 311.
- production of, by adrenaline in thyroidectomy (UNDERHILL), A., ii, 137.
- produced by adrenaline, and its hindrance by urethane narcosis (UNDERHILL), A., ii, 312.
- and acapnia (HENDERSON and UNDERHILL), A., ii, 813.
- after injection of sucrose (LE GOFF), A., ii, 752.
- metabolism in (MEDDGEFANT and KRISTELLER), A., ii, 417.
- and carbohydrate metabolism (PAY and GORDEN; UNDERHILL and FINE), A., ii, 1001.
- degradation of fatty acids in (BAER and BLUM), A., ii, 512.
- creatinine and creatinine excretion in (TAYLOR), A., ii, 310.
- Pancreatic diabetes** in cold-blooded animals (DIAMANT), A., ii, 1117.
- Phloridzin diabetes** (GRUBE), A., ii, 420.
- protein metabolism in (WOLF and OSTERBERG), A., ii, 512.
- Renal diabetes** (POLLAK), A., ii, 417.
- Diactocacetin** (ALZEN and WEIZMANN), T., 85.
- acetone alcohol**, preparation of (HOFFMAN), A., i, 415.
- acetophenone**, *di m* and *p*-hydroxy-compounds of, with tin tetrachloride (PRETZER, FRIEDMANN, GOLDBERG, FROX, and SCHWARZKOPF), A., i, 791.
- 6- and 2,6-Diacetoxyanisole** (MOORE), T., 1015; P., 119.
- Diactoxybutane**, α -bromo- (PARSKIEF), A., i, 941.
- 6-Diacetoxy-3,3'-dimethylthiolhydrobenzoin**, 2,5:2',5'-tetrabromo-, diacetate (ZINCKE, FROHNEBERG, and KEMPF), A., i, 441.
- 4-Diacetoxy-3,3'-ditolyl**, 5,5'-*di*-bromo- (MOHR), P., 227.
- Diactoxymercurianilinobutyric acid**, ethyl ester (SCHÖLLER, SCHRAUTH, and GOLDBACKER), A., i, 760.
- Diactoxymercurianilinoisopropionic acid**, ethyl ester (SCHÖLLER, SCHRAUTH, and GOLDBACKER), A., i, 760.
- Diactoxymercurianilinoisovaleric acid**, ethyl ester (SCHÖLLER, SCHRAUTH, and GOLDBACKER), A., i, 760.
- 4,4'-Diacetoxyl-8-phenylcoumarin** (RANGELINI and LEONARDI), A., i, 902.
- Diactoxysuccinic acid**. See **Diactylsuccinic acid**.
- 8-10-Diacetylthraquinol-1,2-dihydrophenazine** (ULMANN and FODOR), A., i, 467.
- Diactylbenzoylacetone** (AUWERS, DÄNNEHL, and BOENNECKE), A., i, 171.
- 7:13-Diacetyl-5:13-dihydroquinadelline** (FUCHER and ROHNER), A., i, 86.
- Diactylmorphine dichloro** (WIKLAND and KARLMEIER), A., i, 746.
- Diactylloxalic acid**, ethyl ester, phenylhydrazine and methylhydrazones of (HUFES and KOLLISCH), A., i, 230.
- 9-10-Diacetylphenanthrene** and its derivatives (WILLKRODT and ALBERT), A., i, 883.
- Diactylphenylmethylhydrazones** (DIRIX and KOLLISCH), A., i, 230.
- O,N-Diacetylmalicylamide** (THERIERY and HUCK), T., 869; P., 102.
- Diactyltartaric acid**, *diactoxysuccinic acid*, conductivity and dissociation of (DEAKIN and RIVETT), P., 316.
- Dialdan**, diactyl derivative of (WENSCHEIDER and SPAIN), A., i, 113.
- 2,2-Dialdehydodiphenyl** and its phenylhydrazine (KENNER and TURNER), T., 2112; P., 93, 262.
- and its isomer (MAYER), A., i, 870.
- 2,3-Dialdehydopyrrole**, 3,4-dichloro- (COLACCHI), A., i, 225.
- Dialkylanilines**, *ditolyl*, action of hydrosulphuric acid on (VAN ROMBURGH), A., i, 281.
- 5,5-Dialkylbarbituric acids**, imino-, preparation of (MERCK), A., i, 572.
- 5,5-Dialkylpropionic acids**, preparation of derivatives of (FABRICIUS-FABRICIUS VON F. BAYER & CO.), A., i, 250.
- 5,5-Dialkyliminobarbituric acids**, preparation of (MERCK), A., i, 1035.
- 5,5-Dialkylthiobarbituric acids**, preparation of (MERCK), A., i, 1032.
- Dialuric acid**, *p*-phenyleneimine ester of (RICHTER), A., i, 757.
- Dialurodimine** (RICHTER), A., i, 757.
- "Dialysed Gelatin"**, preparation of, from gelatin root (BIRMANN), A., ii, 528.
- Dialysis and Dialysor**. See under **IMF.**
- Diammonium compounds**. See under **Ammonium**.
- Diamond**, electrical conductivity and behaviour of, at high temperatures (DOELTER), A., ii, 601.
- Diamamylcyanamide** (TRAUBE and ENGELHARDT), A., i, 955.
- Diamamylpiperazine** (CLARKE), T., 1984.

- Dianhydrodiacarnine-trinitromesitylene** (HOFER and ROBINSON), T., 2135.
- Dianhydrodiacarnine-2:4:6-trinitro-m-xylene** (HOFER and ROBINSON), T., 2134.
- 1:4-Dianilinoanthraquinone** (ULLMANN and BILLIG), A., i, 490.
- 3:6-Dianilino-p-benzoquinone-3 acetic acid** (MÖRNER), A., i, 57.
- Dianilino-p-benzoquinoneanil** (KÜSTER), A., i, 69.
- 3:6-Dianilino-9-phenylxanthenyl chloride** (POPE and HOWARD), T., 552.
- α-Dianisylfulgenic acid** (STORBE and BENARY), A., i, 377.
- α-Dianisylfulgide** (STORBE and BENARY), A., i, 377.
- Dianisylidene di- and tri-sulphides, dihydroxides** (HUGGE and BLOCH), A., i, 61.
- 3-Dianisyl-2-methyl-4-quinazoline, 4'-amino-, and 4'-amino-7-acetylamino-** (BOBERT, GÖRTNER, and AMEND), A., i, 581.
- 1:1'-Dianthraquinonyl, 2:2'-dihydroxy-** (HENESCH), A., i, 794.
- 4:4'-dihydroxy-, and 2:4:2':4'-tetrahydroxy- and sodium salt of the latter** (SCHOLL and SEER), A., i, 454.
- 2:2'-Dianthraquinonyl, and diamino-, and dinitro-** (SCHOLL and NEOVICS), A., i, 453.
- 2:2'-Dianthraquinonylcarbamide** (FARWENKE, VORM, MEISTER, LUCIUS, & BRÜNING), A., i, 655.
- 1:1-Dianthraquinonyl-p-phenylene-diamine** (ULLMANN and FODER), A., i, 467.
- s-Dianthraquinonylthiocarbamide** (BADISCHE ANILIN- & SODA-FABRIK), A., i, 886.
- Diaryl ketones, metallic compounds of** (SCHLENK and WEICKEL), A., i, 545.
- Diastase** (BURACZEWSKI, KRAUZE, and KRZEMECKI), A., i, 1052.
- action of, on lecithin** (LAFIDUS), A., i, 248.
- of the liver, action of lipoids on** (CENTANNI), A., ii, 54; (STARKENSTEIN), A., ii, 747.
- estimation of** (SCHIROKAUER and WILENKO), A., ii, 675.
- Diastases** (BANG), A., i, 591.
- action of ultra-violet light on** (AGULHON), A., ii, 243.
- influence of serum and lymph on** (WOHLGEMUTH), A., ii, 743.
- Diastatic action, influence of lecithin on** (TERROINE), A., ii, 997.
- Diazoacetic acid, ethyl ester, intersection of, with p-xylene** (BUCHNER and SCHULZE), A., i, 50.
- Diazoamine-compounds, preparation of** (VAUBEL), A., i, 1049.
- Diazoaminotetraselic acid** (HOFMANN and HOCK), A., i, 1048.
- Diazo-φ-anilopyrine chloride, and compound with** (MICHAELIS and ABRAHAM), A., i, 1048.
- Diazo-compounds, thermal studies of** (SVETOSLAVSKI), A., i, 967.
- aliphatic, constitution of** (HOFMANN), A., i, 845.
- Diazohydrazides** (FISCHER), A., i, 1048.
- Diazomethane, action of, on oxazolones** (OLIVERI-MANFROTTO and COPPOLA), A., i, 492.
- Diazonium sulphates, preparation of** (CLAASZ), A., i, 695.
- Diazotetrazolebenzylidenesminoguanine and its sodium salt** (HOFMANN and HOCK), A., i, 1048.
- Diazotetrazolephenylhydrazide and its sodium derivative** (HOFMANN and HOCK), A., i, 1048.
- Diazotetrazole-semicarbazide** (HOFMANN and HOCK), A., i, 1048.
- Dibenzaldehyde, di-m-hydroxy-, and o-, m- and p-nitro-, compounds with tin tetrahalides** (FRIEDMANN, GOLDBERG, PROS, and SCHWARZKOPF), A., i, 791.
- Dibenzhydramine and its hydrochloride** (MATHIE and MÉRAT), A., i, 505.
- 3:6-Dibenzhydriidihydro-1:2:4:5-tetrazine** (STOLLÉ and LAUX), A., i, 599.
- 2:5-Dibenzhydri-1:3:4-oxadiazole, di-α-bromo-, and di-α-chloro-** (STOLLÉ and LAUX), A., i, 598.
- 3:6-Dibenzhydri-1:2:4:5-tetrazine** (STOLLÉ and LAUX), A., i, 599.
- Dibenzoarsinic acid, diquinnone ester of** (OECHSLIN), A., i, 769.
- 3:6-Dibenzo-Δ^{3,5}-cycloheptadiene, 1:2:4-tricyano-** (KENNER and TURNER), T., 2110; P., 263.
- 3:6-Dibenzo-Δ^{3,5}-cycloheptadiene 2-carboxylic acid, 1-imino-** (KENNER and TURNER), T., 2111; P., 263.
- 3:6-Dibenzo-Δ^{3,5}-cycloheptadien 1-one and its oxime** (KENNER and TURNER), T., 2111; P., 263.
- Dibenzophenone, compound of, with tetrachloride** (PEZIFFER, FRIEDMANN, GOLDBERG, PROS, and SCHWALBE), A., i, 791.
- s-Dibenzoylacetonedicarboxylic acid, its di-ethyl ester** (HALE), A., i, 791.
- Di-o-benzoylamino-dibenzamide** (BOBERT, GÖRTNER, and AMEND), A., i, 581.
- Dibenzoyldianilinosilbene and its iodide** (EVEREST and MCCORMIE), T., 1758; P., 218.

- Dibenzoyl-N'-dihydroanthraquinone-**
amine (SCHOLL and EDLACHER), A., i,
136.
- 4,4'-Dibenzoyl-8,8'-dimethylheptane** (HAL-
PER and BAUER), A., i, 652.
- 3,4,5,6-Dibenzoylbenzoic acid** and its
salts and ethyl ester (MAROTTA), A., i,
990.
- Dibenzoyl-β-naphthal** sulphide and
sulphoxide (HILDITCH and SMILES),
T., 983.
- 4,4'-Dibenzoyloxy 3,3'-ditolyl, 5,5'-di-**
benzoyloxy (MOIR), P., 227.
- 8,10-Dibenzoylphenanthrene** (WILL-
GERODT and ALBERT), A., i, 883.
- 27-Dibenzoyl-β-phenylbutyric acid, ethyl**
ester (DICKMANN and V. FISCHER),
A., i, 452.
- 4,6-Dibenzoylphthalic acid** (PHILIPP),
A., i, 793.
- Dibenzoylpiperidine**, compound of, with
tin tetrachloride (PFEIFFER, FRIED-
MANN, GOLDBERG, PROS, and SCH-
WARZKOPF), A., i, 792.
- 28-Dibenzoylpropane** and its oxime
HALLER and BAUER), A., i, 726.
- Dibenzoylrhain** (FISCHER and GROSS,
A., i, 886).
- 2,5-Dibenzoylterephthalic acid** (PHI-
LIPP), A., i, 793.
- 2-Dibenzylaminoacetophenone**, phenyl-
hydrazones of (BUSCH and HEERLE),
A., i, 684.
- Dibenzylaminocuccinic acid** and its salts
FRANKLAND), T., 1781; P., 206.
- Dibenzylammonium nitrite** (RAY and
DATTIA), T., 1477; P., 127.
- Dibenzylbutanetetra-carboxylic acid,**
ethyl ester (WOLFF), A., i, 690.
- Dibenzyleyanamide** (TRAUBER and ENGEL-
HARDT), A., i, 955.
- Dibenzylidimethylethylenediamine**
(CLARKE), T., 1935.
- 3,4,3,6-Dibenzylenebenzoic acid** and its
silver salt and ethyl ester (MAROTTA),
A., i, 981.
- Dibenzylethylcarbinol** (DAVIES and
KIPPING), T., 299.
- Dibenzylhomophthalide** (BAUER and
WOLZ), A., i, 572.
- Dibenzylidene di- and tri-sulphides,**
hydroxides (BLOCH, HOHN, and
BRÜGE), A., i, 47; (BROCH and
BROCH), A., i, 60.
- 2,5-Dibenzylidene** (BROCH, HOHN, and
BRÜGE), A., i, 47.
- 17-Dibenzylideneamino-2-ethyl-1,4-**
quinazoline (BOBERT, BELL, and
AMENIO), A., i, 163.
- Dibenzylidenehydrazinoacethydrazide**
(CRIVIS and HUSSONO), A., i,
400.
- Dibenzylmethylallylammonium iodide**
(EMME and SCHELLBACH), A., i, 282.
- Dibenzylmethylamine, di-*p* hydroxy-**
(TIFFENAU), A., i, 779.
- 22-Dibenzyl-β-methylpropane α,δ-diol**
(PARRY), T., 1173; P., 142.
- Dibenzylmethylallicol** (KIPPING and
HACKFORD), T., 142; P., 9.
- Dibenzylmethylallicyl oxide** (KIPPING
and HACKFORD), T., 142.
- 8,10-Dibenzylphenanthrene** (WILLGER-
ODT and ALBERT), A., i, 883.
- 3,5-Dibenzyl 2,3-phenylathyl 1,4,6-pyr-**
onone (WEIKING, HAUSKERMANN,
WEISSWANGER, and MILLER), A., i,
220.
- 22-Dibenzyl-α-phenylhydrazine hydro-**
chloride (FRANZEN and KRAFT), A.,
i, 817.
- 22-Dibenzylpropane, a bromo-** (DAVIES
and KIPPING), T., 300.
- Dibenzylpropenylcarbinol** (PARRY),
T., 1173; P., 142.
- Dibiphenylene ethylene dichloride** (NOR-
GIE, THOMAS, and BROWN), A., i, 32.
- Di-*p* butyrylphenylcarbamide** (KUNCK-
LIE), A., i, 990.
- Dicamphenone**, and its derivatives (CAS-
TELLANA and FERRELO), A., i, 217.
- Dicamphenoneimine** (CASTELLANA and
FERRELO), A., i, 217.
- Dicamphor**, derivatives of (ODINO), A., i,
475.
- p*-nitroso-**, derivatives of (CASTEL-
LANA and FERRELO), A., i, 217.
- Di-*c* camphor, *p*-nitroso-** (CASTELLANA
and FERRELO), A., i, 217.
- Dicamphor-β-enlphonic acid**, catechol,
resorcinol and quinal esters (HIL-
DITCH), A., i, 893.
- Dicamphor-β-enlphenyl disulphide** (HIL-
DITCH), A., i, 892.
- Di-α-carbethoxybutyrylbensidine** (RUM-
LEY), T., 622.
- 3,5-Dicarboxy 4,4'-diethyltrimethylene-**
dicarbonimide, amide of, and its
metallic salts (GIUGLIENO), A., i, 821.
- β-Dicarboxylic compounds**, reaction be-
tween alkylideneurethanes and (BIAN-
CHI and SCHIFF), A., i, 977.
- Dicentrine**, pharmacology of (IWAKA-
WA), A., ii, 421.
- Di-2-chloro-1-naphthylideneacetone**
(SACHS and BRIGLI), A., i, 720.
- Dicinnamoylceramide** (REMPF), T.,
623.
- Dicinnamoylhydrazide** (MUCKERMANN),
A., i, 682.
- Dicinnamoylpiperidine**, compound of,
with tin tetrachloride (PFEIFFER,
FRIEDMANN, GOLDBERG, PROS, and
SCHWARZKOPF), A., i, 792.

Diennamylidethyllumonium chloride (EMDE and SCHLIMMACH, A., i, 282.

Diennamylidene di- and tri-sulphides, hydroxides (BOGGS and BLOCH), A., i, 61.

Di-*o*-cummaric acid (FISCHER, FREDENBERG, and HOESCH), A., i, 875.

1,3'-Dicoumarone, 2,1'-dihydroxy-, derivatives of (FRIEZE and PFAFFENDORF), A., i, 150.

***α*3-Dicoumylbntano-*β*-dicarboxylic acid** (STORBE and HÄRTTEL), A., i, 377.

***α*3-Dicoumylfulgenic acid** (STORBE and HÄRTTEL), A., i, 377.

- α : β -Diphenyl-3-diphenylene-fulgide** (STORBE, BADENHAUSEN, HENCKES, and WAHL), A., i, 381.
- Diphenylene ketone**. See Fluorenone.
- Diphenylenemrethane**. See 9-Carboxylic acid, ethyl ester.
- Di- β -phenyldimethylammonium iodide** (v. BRAUN), A., i, 85.
- Diphenylethylene**, leuco-bases and colouring-matters from (LEUCHNER), A., i, 399.
- Diphenylethylphosphine sulphide** (BENOFF), A., i, 100.
- 2:6-Diphenyl-1-ethylpiperidine** (SCHOLTZ), A., i, 327.
- 3:5-Diphenyl-3-heptolactone**, δ -hydroxy- (KÖHLER), A., i, 988.
- 2:4-Diphenylcyclohexan-4-ol-6-one-1-carboxylic acid**, ethyl ester, and its corresponding pyrazolone (BENCKMANN and v. FISCHER), A., i, 451.
- 2:6-Diphenylcyclohexan-2-ol-4-one-1-carboxylic acid**, ethyl ester, and its pyrazolone (BENCKMANN and v. FISCHER), A., i, 451.
- 2:6-Diphenyl- Δ^1 -cyclohexen-3:4-dione-1-carboxylic acid**, ethyl ester, and its hydrazone of (DIECKMANN), A., i, 451.
- 2:6-Diphenylcyclohexan-4-one-1-carboxylic acid**, ethyl ester, and its forms of (DIECKMANN), A., i, 451.

- Diphenylhomophthalide** (BAUER and WOLF), A., i, 872.
- 1,3-Diphenylhydantoin, 2-thio-** (WHEELER and BRACHTLECHT), A., i, 501.
- Diphenylhydrazine**, oxidation of (WIRLAND and WIECKE), A., i, 82.
- Diphenylhydroxylamine**, 4'-bromo-, 4'-chloro-, and 4'-iodo-, 4-nitroso-, and dibromo-, and di-iodo-, nitroso- (BAMBERGER and HAM), A., i, 685.
- γ -Diphenylitaconic acid**, α -ethyl β -hydrogen ester (STORBE), A., i, 540.
- Diphenylketone**, preparation of, and its compound with azibenzil (STAUDINGER), A., i, 650.
- action of, on nitroso-compounds (STAUDINGER and JELAGIN), A., i, 215.
- action of, on quinones (STAUDINGER and BERZZA), A., i, 459.
- Diphenylmethane**, preparation of, and its homologues (V. MEYER), A., i, 120.
- α -sulphoxide, intramolecular rearrangements of (HILDITCH and SMILEY), T., 145; P., 3.
- ω -dinitro-*pp*-diamino- (CASSELLA & Co.), A., i, 504.
- Diphenylmethane 4,4'-dicarboxylic acid**, di- α -chloro-, methyl ester (STAUDINGER, CLAR, and CZAKO), A., i, 625.
- chloride (STAUDINGER and CLAR), A., i, 639.
- Diphenylmethanesulphonic acid** (WEDKIND and SCHENK), A., i, 190.
- 1,1-Diphenyl- α , α -methoxyphenylfulgenic acid**, methyl ester (STORBE and REDBELLIN), A., i, 350.
- Diphenylmethylamine**, preparation of, and its picrate (BILTZ and SEYDEL), A., i, 281.
- Diphenylmethylamine 2'-carboxyllo acid**, 2,4-dinitro- (HOFMANN, ABENET, and ETTINGER), A., i, 129.
- 3,4-Diphenyl-6-methylaximino-pyrazole** (MICHAELIS and RIECK), A., i, 1037.
- 3,4-Diphenyl-6-methylidihydropyrazo-furan** (MICHAELIS and RIECK), A., i, 1037.
- α , β -Diphenyl-8-methylfulgenic acid** and its ethyl hydrogen ester (STORBE and ROSE), A., i, 376.
- α , β -Diphenyl-8-methylfulgide** (STORBE and ROSE), A., i, 376.
- α , β -Diphenyl-8-methylpropane- α , β -diol** (PARSON, T., 1172; P., 141).
- 1,3-Diphenyl-8-methylpyrazoleimine-3'-phenylloxazolone** (MEYER), A., i, 687.
- 3-Diphenyl-3-methyl-4-quinazolone**, 4'-amino-, 4'-amino-7-acetylamino-, and 6-bromo-4'-amino- (BOGERT, GORTNER, and AMEND), A., i, 581.
- α , β -Diphenyl-8-methylloxocarbazide** (BUSCH and LIMPACH), A., i, 335.
- α , β -Diphenyl- α -methylloxocarbazide**, and its thiocarbonyl chloride (BUSCH and LIMPACH), A., i, 335.
- α , β -Diphenyl- α -methylthioxocarbazide** (BUSCH and LIMPACH), A., i, 334.
- β -Diphenylitaconic acid**, ethyl ester of (BESCHKE, WINOGRAD-FINKEL, and KOHNE), A., i, 874.
- Diphenyl- ω -nitrobenzylidenobenzoylhydrazidine** (BUSCH and RUPPENTHAL), A., i, 87.
- Diphenyloxaliminochloride-pyridinium chloride** (RIEKENSTEIN and BREUNING), A., i, 226.
- Diphenyloxethylphosphinic acid**, ethyl salt (ARBUOFF), A., i, 100.
- γ -Diphenylparaconic acid**, β -bromo- (STORBE), A., i, 540.
- α , β -Diphenylpentan- γ one** and its semicarbazone (SENDERGNO), A., i, 303.
- 1,3-Diphenyl 5-phenoxyethylpyrazole** (V. WALTHER and LITTER), A., i, 237.
- 1,4-Diphenyl 3-phenoxyethylpyrazolone**, 5-amino-, and its salts and derivatives (V. WALTHER and HIRSCHKE), A., i, 237.
- 2,4-Diphenyl 3-phenoxyethylpyrazolone** (V. WALTHER and HIRSCHKE), A., i, 238.
- Diphenyl-*p*-phenylene disulphide** (BOURGEOIS and FOUASSIN), A., i, 964.
- Diphenyl 3-phthaloylic acid**, 4,4'-dihydroxy-, and its calcium salt (SCHOLL and SEER), A., i, 453.
- α , β -Diphenyl α -piperonylbutane- β - γ -dicarboxylic acid** and its anhydride (STORBE, KOHLMANN, BADENHAUSEN, and KALNING), A., i, 380.
- α , β -Diphenyl α -piperonylfulgenic acid** (STORBE, KOHLMANN, BADENHAUSEN, and KALNING), A., i, 380.
- α , β -Diphenyl α -piperonylfulgide** (STORBE, KOHLMANN, BADENHAUSEN, and KALNING), A., i, 340.
- Diphenylpropionamide** (V. MEYER and NICOLAUS), A., i, 121.
- Diphenylpropylphosphine sulphide** (ARBUOFF), A., i, 100.
- 3,4-Diphenylpyrazole** (WISLICENUR and RUTHING), A., i, 304.
- 2,6-Diphenyl-4-pyridone-3-carboxylic acid** (PETRENKO-KRITSCHENKO and SCHOTTLE), A., i, 1021.
- 2,3-Diphenylquinoxaline**, 5-nitro- (BOESCHKE and RANTSCHOFF), A., i, 330.
- Diphenylstibine oxide** and sulphide and chloro- (MICHAELIS and GÜNTHER), A., i, 1066.

- Diphenylstilbinic acid, *o*-*m*-nitro-** (MORGAN and MICKLETHWAIT), T., 2294; P., 274.
- Diphenylsulphamide, 4:4'-dibromo-, 2:4:4'-tribromo-, and 2:4:2':4'-tetra-nitro-** (WOHL and KOCH), A., i, 37.
- 55-Diphenyl- α -styrylfulgenic acid** (STORBE, BENARY, and SEYDEL), A., i, 380.
- 55-Diphenyl- α -styrylfulgide and its di-bromide** (STORBE, BENARY, and SEYDEL), A., i, 380.
- Diphenylsulphone, action of bromine on** (BÜCKEN), A., i, 41.
- Diphenyl-2:6:2':6'-tetracarboxylic acid and its derivatives** (MAYER), A., i, 869.
- Diphenyl-3:4:3':4'-tetracarboxylic acid, 6-nitro-, and its silver salt an-ethyl ester** (CHOSLEY and HAMPSHIRE), T., 724.
- Diphenylthiocarbamide, *p*-dihydroxy-** (CHEMISCHE FABRIK LADENBURG), A., i, 438.
- Diphenylthiophosphinic acid, ethyl ester** (ARNDT), A., i, 100.
- Diphenylthiophosphinone acid, esters of** (ARNDT), A., i, 100.
- 53-Diphenylthiosemicarbaside- α -carb-oxylic acid, ethyl ester** (BÜSCH and LIMPACH), A., i, 690.
- 2:3-Diphenyl-1-teleldihydroisobenzofuran, and hydroxy-** (GUYOT and VALLETTE), A., i, 653.
- 2:4-Diphenyl-1-*p*-tolyl-3:5-dihydro-1:2:3-triazole and the corresponding tetrahydrotriazole** (BÜSCH and HEFLE), A., i, 583.
- Diphenyl-*p*-tolyl- ψ -thiocarbamide** (ARNDT), A., i, 920.
- 2:5-Diphenyl-1:3:4-triazole hydrchloride** (FRANZEN and KRAFT), A., i, 817.
- 2:5-Diphenyl-1:3:4-triazole, 1-amino-, salts of** (FRANZEN and KRAFT), A., i, 816.
- 55-Diphenyl- α -veratrylfulgenic acid and its sodium salt and dimethyl ester** (STORBE, KOHLMANN, and REDDELIEN), A., i, 380.
- 55-Diphenyl- α -veratrylfulgide** (STORBE, KOHLMANN, and REDDELIEN), A., i, 380.
- 2-(4')-Diphenylamine- α -naphthaquinone** (PUMMEBER and BRASS), A., i, 655.
- 4-Diphenylidiguamide, 4'-amine-** (COHN), A., i, 929.
- Diphorene, compound of, with tin tetra-chloride** (PFEIFFER, FRIEDMANN, GOLDBERG, PERG, and SCHWARZKOPF), A., i, 791.
- Diphthaloylbenezene** (PHILIPPI), A., i, 794.
- 2:3:6:7-Diphthaloylcarbamate** (SCHOLL and NISVUS), A., i, 567.
- 2:3:6:7-Diphthaloyl-*N*-methylthiophenylamine** (SCHOLL, SEEL, and TRITSCHE), A., i, 559.
- 2:3:6:7-Diphthaloylthianthren** (SCHOLL and SEEL), A., i, 558.
- 2:3:6:7-Diphthaloylthiodiphenylamine thiodianthraquinonylamine and its sulphonic acid** (SCHOLL and SEEL), A., i, 558.
- 50-Dipierylidiaminodiphenyl** (KEHRMANN and STEINBERG), A., i, 1034.
- Dipiperine, compounds of, with the tetra-bromide and -chloride** (FRIEDMANN, GOLDBERG, PERG, and SCHWARZKOPF), A., i, 792.
- Dipiperonal, compounds of, with the tetra-bromide and -chloride** (FRIEDMANN, GOLDBERG, PERG, and SCHWARZKOPF), A., i, 791.
- 53-Dipiperonylbutane-8-*y*-dicarboxylic acid** (STORBE, VIEWEG, ECKERT, and REDDELIEN), A., i, 378.
- 53-Dipiperonylfulgenic acid and its potassium salt and ethyl ester** (STORBE, VIEWEG, ECKERT, and REDDELIEN), A., i, 378.
- 53-Dipiperonylfulgide** (STORBE, VIEWEG, ECKERT, and REDDELIEN), A., i, 378.
- 1:2-Diisopropenylcyclobutane** (LEBERGOTT), A., i, 774.
- 52-Dipropenilin** (ALPERN and WEISSMANN), T., 25.
- 1:3-Dipropenylindole** (ONDO and SESSA), A., i, 487.
- Di-*p*-propenylphenylcarbamide** (KUSCHELL), A., i, 990.
- 5-Dipropylamine- α -phenyl- Δ^2 -buten-*y*-one** (ANDRÉ), A., i, 269.
- Dipropylammonium osmichloride** (BIEBER and MAISCH), A., i, 19.
- telluri-bromide and -chloride** (GEBIER, FLURY, and MICHFELT), A., i, 182.
- Dipropylbarbituric acid** (MERCK), A., i, 653.
- 1:2-Diisopropylcyclobutane** (LEBERGOTT), A., i, 774.
- Dipropylbutanetetracarboxylic acid and ethyl ester** (WOLFF), A., i, 690.
- 2:2'-Di-*n*-propyl-1:1'-dianthraquinonyl** (SCHOLL, POTTSCHWATZHEG, and LENKO), A., i, 1008.
- 2:2'-Di-*n*-propyl-1:1'-dianthraquinonyl** (SCHOLL, POTTSCHWATZHEG, BÄCKE, and LENKO), A., i, 1009.
- Dipropylethylenedibarbitoric acid** (WOLFF), A., i, 690.
- Dipropylmalenylmalenamide** (REMFERT), T., 618.

- Dipropylmalonylbenzidine** (REMFY), T., 622.
- Dipropylmalonyldimalenamide** (REMFY), T., 619.
- Dipropylthioarbituric acid** (MRACK), A., i, 653.
- Diprotocatechuic acid** (FISCHER and FREUDENBERG), A., i, 875.
- Dipyrryl and its derivatives** (ODDO and ANDO), A., i, 496.
- Dipyrrylquinaxaline** (ODDO and ANDO), A., i, 496.
- 1:2 Diquinoyl salts** (KAUFMANN, STRUBIN, ANASTACHEWITCH, POPPER, and SNAJDER), A., i, 328.
- Di- β -resorcylic acid** (FISCHER and FREUDENBERG), A., i, 875.
- Dissaccharides**, detection of small quantities of (NEUBERG and SANAYOSHI), A., ii, 1036.
- Diethylaldehyde**, compounds of, with tin tetra-bromide and -chloride (PFEIFFER, FAIDMANN, GOLDBERG, PROSS, and SCHWARZKOPF), A., i, 791.
- Diseases**, excretion of amino-acids in (MASUDA), A., ii, 631.
- Disinfectants**, chemical (DELEPINE), A., ii, 62.
- influence of temperature on** (FASSON, PONDER, and WOODHEAD), A., ii, 63.
- resistance of micro-organisms to** (HALLER), A., ii, 1021.
- Disinfection**, theory of (HRENZOG and BETTEL), A., ii, 1020.
- of plants** (DANKS and TORT), A., ii, 620.
- dispersoids**, viscosity of (HATCHEK), A., ii, 19, 98.
- dissociation**. See under Affinity, chemical.
- distillation**, new flask for (DAHLER), A., ii, 975.
- of liquid binary mixtures** (MARILLER), A., ii, 254.
- fractional apparatus for** (TETWINSKY), A., ii, 876.
- continuous fractional**, in a vacuum, apparatus for (FRANCISONI and SERNAGIOTTO), A., ii, 966.
- pressure regulator for use in** (WADE and MERRIMAN), T., 934; P., 64.
- vacuum**, receivers for (JOHN), A., ii, 876.
- styryl ketone semicarbazone** (KNORRER), A., i, 1034.
- sulphides**, aromatic, synthesis of thioxanthone derivatives from (MARSDEN and SMILES), T., 1353; P., 207.
- formation of** (BOURGEOIS and FOTASSIN), A., i, 963.
- interaction of**, and sulphuric acid (PKEACOTT and SMILES), T., 640; P., 65.
- Disulphurides**, aromatic, interaction of, with sulphuric acid (HILDRICH), T., 1091; P., 139.
- Disyriagic acid** (FISCHER, FREUDENBERG, and LERSIUS), A., i, 875.
- Dithiolphthalic acid**, methyl ester (REINERT and HOLLE), A., i, 981.
- o*-Ditolhydribenzene** (GUYOT and VALLETTE), A., i, 653.
- 3:6 Di-*p*-toluidine-*p*-benzoquinone-8-acetic acid** (MÖRNER), A., i, 57.
- 3:6 Di-*o*- and *p*-toluidine-8-phenylranthonyl chlorides** (POPE and HOWARD), T., 552.
- Ditolquinhydrone and its derivatives** (MOIR), P., 226.
- Ditolquinone and its derivatives and dibromo** (MOIR), P., 226.
- 2:2' Ditolyl**, formation of six and seven-membered rings from derivatives of (KENNER and TURNER), T., 2101; P., 262.
- 2:2' Ditolyl**, *o,o'*-dibromo, and *o,o',o''*-*ultra*-bromo- (KENNER and TURNER), T., 2104; P., 93.
- 3:3' Ditolyl**, 3-bromo-3'-nitro-4:4'-*di*-hydroxy-, and 5:5'-*di*-nitro-4:4'-*di*-hydroxy- (MOIR), P., 227.
- Ditolylamine**, diamino-, and its diacetyl derivative (TILMANN and SCHMID), A., i, 71.
- mp* Ditolylamine and its hydrochloride** (SCHOLL, SEER, and TRITSCH), A., i, 559.
- 1:2 Ditolylis-benzofuran and its phenylhydrazine** (GUYOT and VALLETTE), A., i, 653.

- 2:2' Ditolyl-*o,o'*-dicarboxylnitrile** (KENNER and TURNER), T., 2109; P., 263.
- 1:2 Ditolyl 1:2-dihydroisobenzofuran and 2-hydroxy** (GUYOT and VALLETTE), A., i, 653.
- 3:3' Ditolylidisulphonic acid**, 4:4'-*di*-hydroxy-, barium salt (MOIR), P., 227.
- Di-*p*-tolylisnephthalide** (SCHOLL and SEER), A., i, 454.
- Di-*p*-tolylmethane**, action of, with dichloromethane (LAVALEX), A., i, 633.
- 9:10 Di-*p*-tolyl-2-methylanthracene** (GUYOT and VALLETTE), A., i, 653.
- 9:10 Ditolyl-2-methylidihydroanthracene**, 8:10-*di*hydroxy- (GUYOT and VALLETTE), A., i, 653.

Di-*p*-tolyl methyl ether disulphide and disulphoxide (HILDITCH), T., 1190.
2-Ditoly-3-methyl-4-quinazalone, 4'-amino-, and 4'-amino-7-acetylaminomethyl- (BOOKER, GORTNER, and AMEND), A., i, 581.
Di-*o*-tolylxalliminochloride-pyridinium chloride and platinumchloride (REITZENSTEIN and BREUNING), A., i, 226.
Di-*p*-tolylphenylcarbinol-*o*-sulphen-methylamide (COBB and FULLER), A., i, 638.
Di-*p*-tolyl *p*-phenylene disulphide (BOURGEOIS and FOUARMIN), A., i, 964.
1:4-Di-*p*-tolylsulphonamidoanthraquinone (ULLMANN and BILLIG), A., i, 490.
Ditoly-*o*-tolylhydriphenylcarbinol (GUYOT and VALLETTE), A., i, 653.
4-Ditriphenylmethylcarbamide (V. MEYER and FISCHER), A., i, 120.
Divalolactone, constitution of (LOWAN-ITCH), A., i, 804.
Divaric acid (HEPPE), A., i, 209.
Divaricatic acid and its salts and esters (HEPPE), A., i, 209.
Divaricatinic acid, salts and ethyl ester of (HEPPE), A., i, 209.
Divarinol and its diacetate (HEPPE), A., i, 209.
3:6-Di-*m*-xylylidino-*p*-benzoquinone 3-acetic acid (MÖRNER), A., i, 57.
Di-*p*-xyloquinol monomethyl ether and its derivatives (RAMBERGER and BLANCY), A., i, 833, 884.
Di-*p*-xylylenedipiperidinium salts (SCHOLTZ), A., i, 327.
Di-*o*-3-, *m*-4-, and *p*-xylylphthalimides (KUHARA and KOMATSU), A., i, 207.
Dodecyl alcebel and its phenylurethane (WILLSTÄTTER, MEYER, and HÜNI), A., i, 146.
Dodecane, *α*-dichloro- (V. BRAUN and SOBECKI), A., i, 598.
Dodecylbenzamide, *μ*-chloro- (V. BRAUN and SOBECKI), A., i, 598.
Dog, ingestion of mineral acids by the (LABBE and VIOLLE), A., ii, 220.
analyses of the urine of the fox, coyote and (HAWK), A., ii, 308.
Dog-fish, acidity of the gastric juice of the (VAN HERWERDEN and RINGER), A., ii, 1109.

Dog-fish, digestion of proteins of the (VAN SLYKE and WHITE), A., ii, 1101.
Dolomite, origin of (LINCK), A., ii, 1101.
Double linking, influence of on catalytic activity (FRANKLAND and GIBBS), VAN, T., 2325; P., 319.
Drying agents, relative efficiency of calcium and zinc bromides and zinc chloride (BAXTER and WARREN), A., ii, 268.
Drying-apparatus (MCINTIRE), A., ii, 329.
Drugs, diuretic power of (ZANZI), A., ii, 1017.
action of, on the cerebral blood vessels (DIXON and HALLIBRIDGE), A., ii, 52.
effect of, on the chorda tympani (DALE and LAIDLAW), A., ii, 134.
effect of, on muscle and nerve (WALLER), A., ii, 134.
action of, on the bronchial mucus (JANTSCHKE and POLLAK), A., ii, 1120.
action of, on respiration (V. ISHIDA), A., ii, 1017.
pyro-analysis of (ROSENTHAL), A., ii, 948.
Dundathic acid (BAKER and SMITH), A., i, 479.
Dundatholic acid (BAKER and SMITH), A., i, 479.
Dust explosions, lecture experiments illustrate (LANG and LLOYD), P., ii, 244.
Dyeing, theory of (DREAPER), T., ii, 244.
experiments in (SAPORSHNIKOFF), A., ii, 1070.
cohesion as a factor in (ROSENTHAL), A., ii, 99, 372.
Dyes. See Colouring matters.
Dynamic isomerism (BRITISH ASSOCIATION REPORTS), A., ii, 786.
Dyspnea and respiration (HUGHES), A., ii, 993.
Dysprosium bromate, carbonates, chlorate, platinocyanide, phosphate, and selenate (JANTSCH and OHLE), A., ii, 492.

E.

Earth, distribution of elements in the crust of the (VERNADEK, L. DENER, and REVUTSKY), A., ii, 1042.
radiation of the, at different times (MCLENNAN and MACALLUM), A., ii, 960.

- Bartha, *turn, refraction of solutions of* the (ELLAS), A., ii, 81.
compounds of (PRAET and JAMES), A., ii, 592.
compounds of metallic salts of the, with hexamethylenetetramine (BARKER and CALZOLARI), A., i, 368.
complex molybdates of (BARKER), A., ii, 291.
double nitrates of the (JANTCH and WIGDOROW), A., ii, 114.
analysis of minerals of the, by means of sulphur monochloride (HICKS), A., ii, 934.
stearate separation of the (STODART and HILL), A., ii, 727.
dextrose in (DIAMARE), A., ii, 129.
heat production in the oxidative processes of (MEYERHOF), A., ii, 1004.
biology of (DIAMARE), A., ii, 1110.
lipids of the yolk of (SKRONO and FALCINI), A., ii, 1005.
ben's, chemistry of (KOJO), A., ii, 1110.
presence of dextrose and creatinine in (SALKOWSKI), A., ii, 624.
ac-nurbin's, oxidation and cytotoxicity of (LOES and WASTENEY), A., ii, 304.
catalase of (AMBERG and WINTERNITZ), A., ii, 1110.
oxidative processes in (LOES and WASTENEY), A., ii, 1110.
poisonous action of sodium chloride on (WARRBURG), A., ii, 60.
respiration of, in sodium chloride solution (MEYERHOF), A., ii, 738.
unfertilized, action of calcium and sodium salts on (LILLIE), A., ii, 128.
gg-white, relation between digestibility of, and its coagulation temperature (FRANK), A., i, 698.
piostonite from California (ROGERS), A., ii, 807.
alberite (GROSSFLETCHER), A., ii, 807.
aldin reaction, the (FOKIN), A., i, 5.
aldons and its oxime (EATONFIELD and TAYLOR), T., 2308; P., 279.
alicy chloride, di-iodo- (ABDERHALDEN, HIRSCH, and GUGGENHEIM), A., i, 954.
alylalaline, di-iodo- (ABDERHALDEN, HIRSCH, and GUGGENHEIM), A., i, 955.
alylglycine, di-iodo-, and its ethyl ester (ABDERHALDEN, HIRSCH, and GUGGENHEIM), A., i, 955.
alyl-di-iodotyrosine, di-iodo- (ABDERHALDEN, HIRSCH, and GUGGENHEIM), A., i, 955.
Elasticity, relation between, and specific heat of solids with monatomic molecules (EINSTEIN), A., ii, 186.
Elastic, action of pepsin on (ABDERHALDEN and WACHMUTH: ABDERHALDEN and STRACH), A., i, 511.
use of, in detection of proteolytic enzymes (ABDERHALDEN and MEYER: ABDERHALDEN and KISSWITTER), A., ii, 999.
Electrical double refraction. See under Photochemistry.

Electrochemistry of solutions in acetone (ROSDENWERNY and LEWIS), T., 2188; P., 266.
Electricity, carriers of, in gases (BARKER), A., ii, 957.
Accumulator, lead, rapid formation of plates in (SCHERIKER), A., ii, 848.
Cell, mercury, mercurous chloride, lead chloride, lead, thermodynamics of the (LATHEK), A., ii, 577.
Clark, in relation to zinc amalgams (JOHN and VAN GINNEKEN), A., ii, 14.
Cells, concentration, containing the same salt in two different solvents, temperature coefficient of (LAPPIER), A., ii, 576.
with electrodes reversible to chlorine ions (LAPWORTH and PARFITT), T., 3417; P., 194.
galvanic, rate of discharge of (REICHSTEIN), A., ii, 249.
with carbon anodes (BECHTEREV), A., ii, 1054.
gas, yielding an appreciable current (BEUTNER), A., ii, 249.
standard (VAN GINNEKEN and KRUYS), A., ii, 902.
thermodynamics of (COHEN), A., ii, 180.
mercurous sulphate as a depolarizer in (VAN GINNEKEN), A., ii, 179; (HULBERT), A., ii, 848.
valve, influence of electrolytes on the voltage of (SCHULZER), A., ii, 365, 780.
Coulometer, silver, use of silver fluoride in the (EISENREICH and FORSTER), A., ii, 461.
Dielectric cohesion of gases of the argon group (BOUZY), A., ii, 458.
Dielectric constants of liquid hydrides (PALMER and SCHLUDT), A., ii, 458.
of organic compounds (DOBROSSOFF), A., ii, 458.
Electrical conduction, application of the electron theory to (V. MARTIN), A., ii, 177.

ELECTROCHEMISTRY:—

- Electrical conductivity**, influence of pressure on, of electrolytes (SCHMIDT), A., ii, 12.
 and ionisation of electrolytes in aqueous solution (WEST and JONES), A., ii, 10.
 of metals, changes in the, on liquefaction (WAGNER), A., ii, 177.
 of salts and mixtures of salts (BEX-KATH and WALNOFF), A., ii, 847.
 of solutions, influence of temperature and pressure on (LUSSANA), A., ii, 462; (KORBER), A., ii, 863.
 in acetic and propionic acids (SACHANOFF), A., ii, 689, 691.
 in esters with small dielectric constants (SACHANOFF), A., ii, 247.
 and viscosity in mixed solvents containing glycerol (GUY and JONES), A., ii, 863.
Electrical induction in chemical reactions (WINSTON), A., ii, 692.
Electrical double refraction of liquids (LIPPMANN), A., ii, 184.
Electric arc, reactions of substances in the (SALMON), A., ii, 15; (SABATIER), A., ii, 91.
 flame from the, in pure nitrogen (STREET), A., ii, 1056.
Electric discharge, chemical action of, in electrolytic gas (KIRKBY), A., ii, 462.
 in the vapours of alkali metals (GEHLHOFF), A., ii, 349.
 in rubidium and cesium vapours, electrical and optical measurements in the. (GEHLHOFF), A., ii, 82.
Electric furnace, vacuum (GOECKE), A., ii, 1053.
Spark-gap, influence of the metal of the, on the frequency of electrical vibrations (ROSHANSKY), A., ii, 15.
Electrification, by contact (HESSEUS), A., ii, 13.
 positive, due to heating aluminium phosphate (HORTON), A., ii, 90.
Electrode, ammonium (SLADE), T., 1974; P., 242.
 potential of the chlorine (LEWIS and EUPKERT), A., ii, 364.
 potentials in the manufacture of chlorine and alkali (SACKERDOTI), A., ii, 789.
 $\text{Cu} | \text{Cu}_2\text{O alkali} | \text{H}_2$, potential of the (ALLMAND), T., 840; P., 69.
 $\text{Hg} | \text{HgO alkali}$, potential of the (DONNAN and ALLMAND), T., 346; P., 70.

ELECTROCHEMISTRY:—

- Electrode**, hydrogen, in alcohol (HARRIS and LAPWORTH), T., 244.
 potential measurements with the, in liquids containing carbon dioxide (HARSELBAUGH), A., ii, 182.
 of the third type for measurement of the potential of the chlorine gas (SPENCER), A., ii, 364.
Electrodes, changes in concentration at the, in electrolysis (BENNETT and MILLER), A., ii, 181.
Anodes, copper, behaviour of, in electrolysis of hydrochloric acid (DUEHMAN), A., ii, 181.
 iron, passivity of the (HARRIS and RANDOLPH), A., ii, 14.
 nickel, passivity of the (HARRIS and RANDOLPH), A., ii, 14.
 velocity of solution of the, in sulphuric acid (RUSSELL), A., ii, 181.
Anodes, carbon, in galvanic cells (BECHTEREFF), A., ii, 1064.
Cathode potential fall in gases (EUGARDT), A., ii, 178.
Electrolytes, conductivity and ionisation of, in aqueous solution (HARRIS and JONES), A., ii, 19; (HARRIS and JONES), A., ii, 969; (HARRIS and JONES), A., ii, 969.
 potential differences between, in, and (GUYOT), A., ii, 1052.
 influence of pressure on the conductivity of (SCHMIDT), A., ii, 12.
 electrolytic valve (SCHULZE), A., ii, 365.
 electrodes with alkaline solution (T., 840; P., 69; (DONNAN and ALLMAND), T., 845; P., 70).
 diffusion in solutions of (VAN DER GIRARD), A., ii, 860.
 diffusion of, in colloids (ROSE), A., ii, 969.
 solubility of, in aqueous solution (MASSON), T., 1132; P., 323.
 boiling of, on passage of an electric current (CEGIELSKI), A., ii, 16.
 dissociation of, in non-aqueous solvents (KREIDER and JONES), A., ii, 362.
 amphoteric, dissociation of (CHAEKIS), A., ii, 577.
 solid, polarisation of (HARRIS and ZAWADZKI), A., ii, 1053.
 ternary, dissociation of (JONES), A., ii, 362.
 weak, the dilution law applied (SUTHERLAND), A., ii, 105.

ELECTROCHEMISTRY:—

- Electrolytes**, adsorption of, by soils (OSTWALD), A., ii, 374.
- ionisation and hydration of, in aqueous solution at 0° (WASHBURN and MACINNES), A., ii, 1074.
- estimation of the degree of ionisation of (WASHBURN), A., ii, 862.
- Electrolytic dissociation**, theory of (KJELLIN), A., ii, 243; (BJERRUM), A., ii, 377.
- relation of molecular association to (TURNER), T., 880; P., 40.
- and enzyme action (ROHOVSI), A., i, 738.
- and solution pressure (KEUGER), A., ii, 789.
- Electrolytic reduction** of aromatic aldehydes (LAW), T., 1113; P., 133.
- of benzylidene bases (LAW), P., 310.
- Electrolytic saturation current**, production of an (JAYKE), A., ii, 962.
- Electrosynthesis** (LOWENTRICH), A., i, 177.
- Electromotive forces**, measurement of, in alcohol (LAPWORTH and PARTINGTON), T., 1417; P., 194; (HARDMAN and LAPWORTH), T., 2242; P., 244.
- calculation of, from thermal effects (POLLITZER; COHEN), A., ii, 180.
- thermo-dynamic calculation of (HALLA), A., ii, 864.
- produced by centrifugal action (TOLMAN), A., ii, 248.
- of the voltaic couple (GUGLIELMO), A., ii, 179.
- Electron conception of valency** (FAIK and NELSON), A., ii, 104.
- Electrons**, number of, in the atom (WILSON), A., ii, 593.
- number of, concerned in metallic conduction (NICHOLSON), A., ii, 826.
- heat liberated during the absorption of, by metals (RICHARDSON and COOKE), A., ii, 358.
- velocity of emission of, by metals (HARZ and JUST), A., ii, 954.
- velocity of emission of, by metals in ultra-violet light (HUGHES, KOVARIK and ZAKRZEWSKI), A., ii, 572.
- negative, emission of, by alkali metals (FREDENHAGEN), A., ii, 571.
- Ionisation** of atmospheric air (EVE), A., ii, 89.
- produced by β -particles (GEIGER and KOVARIK), A., ii, 564.

ELECTROCHEMISTRY:—

- Isolation** produced by splashing and in chemical reactions (BLOCH), A., ii, 176, 357.
- and chemical action (BLOCH), A., ii, 456.
- relation between adsorption and (OSTWALD), A., ii, 1068.
- correlation of, with chemical structure by means of polarity (HIERCK), A., ii, 713.
- of electrolytes (WASHBURN and MACINNES), A., ii, 1076.
- and conductivity of electrolytes in aqueous solution (WEAT and JONES), A., ii, 10; (HOSFORD and JONES), A., ii, 960; (WINSTON and JONES), A., ii, 961.
- of gases (TOWNSEND), A., ii, 355; (FRANCK and WESTPHAL), A., ii, 957.
- effect of temperature on the (CLO), A., ii, 355.
- by α -rays (MURIN), A., ii, 171.
- by cathal rays (KELLIGEN), A., ii, 958.
- by chemical change (BAKER), A., ii, 244.
- by Rontgen rays (BEATTY), A., ii, 245.
- by light (CANNKUIKER), A., ii, 455.
- by ultra-violet light (NACHS), A., ii, 246.
- by the α particles from polonium (TAYLOR), A., ii, 354.
- in presence of non-radioactive substances (DE BROGLIE and BRIZARD), A., ii, 837.
- relation of valency to (MILLIKAN and FLETCHER), A., ii, 573.
- of liquid hydrocarbons (BIALONJESKI), A., ii, 837.
- in non-aqueous solvents (DAWSON and LESLIE), T., 1601; P., 208.
- of the vapour of salts in a flame (MOREAU), A., ii, 455, 686.
- estimation of the degree of, of electrolytes (WASHBURN), A., ii, 862.
- Ion**, isolation of an, and measurement of its charge (MILLIKAN), A., ii, 175.
- measurement of the charge on an, and its relation to valency (MILLIKAN and FLETCHER), A., ii, 573.
- Ions**, production of, in chemical reactions (REBOUL), A., ii, 692.
- charges on, in gases (TOWNSEND), A., ii, 686.

ELECTROCHEMISTRY:—

- Ions**, mobility of, in gases (REINOLANUM), A., ii, 788, 837.
 action of, on the heart and on colloids (MINES), A., ii, 130.
 effect of, transported by the current, on the primary affinity for colours and the conductivity of polarised nerves (SCHWARTZ), A., ii, 306.
 gaseous, the mass of (DUANE), A., ii, 839.
 dissymmetry of positive and negative, relatively to the condensation of water vapour (BESSON), A., ii, 839.
 positive, emitted by salts of the alkali metals (RICHARDSON), A., ii, 9, 10.
 formation of, by heated metals (KLEMSIEWICZ), A., ii, 1050.
 emission of, from heated salts (RICHARDSON), A., ii, 1051.
 mobility of, from heated aluminium phosphate (TODD), A., ii, 1050.
 discharge of, from heated sodium phosphate (HORTON), A., ii, 246.
 mobility of, in gases (TODD), A., ii, 245.
 flame, mobility of (LASEBY), A., ii, 245.
 radioactive, mobility of (FRANCK and MEITNER), A., ii, 958.
 tervalent, action of, on the frog's heart (MINES), A., ii, 633.
Ionic theory, objections to the (URBAIN), A., ii, 861.
Polarity of elements and radicles (DERICK), A., ii, 712, 713.
Potential of hyposulphite reactions (JELLINEK), A., ii, 365.
Potentials, liquid, elimination of, in potential measurements (BJERRUM and BJERRUM), A., ii, 692.
Potential difference at the contact of two electrolytes (BJERRUM), A., ii, 182.
Thermoelectric forces in the transition from solid to liquid (CERMAK and SCHMIDT), A., ii, 1055.
 properties of various inorganic substances (KOENIGSBERGER and WEISS), A., ii, 578.
Transport numbers, relation between, and molecular complexity (MAZZUCHELLI), A., ii, 962.
Voltaic couple, electromotive force of the (GUGLIEMO), A., ii, 179.
Voltameter, copper, effect of sucrose on the accuracy of the (DEDE), A., ii, 461.

ELECTROCHEMISTRY:—

- Voltameter** with mercurous perchlorate (MATHERS and GILBERT), A., ii, 577.
 water, migration of ions in the (STREINTZ), A., ii, 15.
Electrolytes. See under *Electrochemistry*.
Electromotive force. See under *Electrochemistry*.
Electron. See under *Electrochemistry*.
Elements, distribution of, in the earth's crust (VERNADESKY, LINDNER and REVUTSKY), A., ii, 1042.
 classification of the (CARRER), A., ii, 593.
 dominant, atomic weights of (HILSCH), A., ii, 1080.
 arrangement of, in a spiral (EMERSON), A., ii, 198.
 tabular grouping of the (v. STAUDENBERG), A., ii, 708.
 fundamental properties of the (RICHARDS), T., 1201; P., 17.
 atomic heats of the (KOENIGSBERGER), A., ii, 580.
 specific gravities of, in relation to the periodic system (HOPKINS), A., ii, 698.
 of the fourth group, cryoscopic measurements of (FALCICOLA), A., ii, 370.
Emetine, and its salts and derivatives (KELLER), A., i, 104.
Emodic acid and its triacetyl derivative (FISCHER and GROSS), A., i, 266.
Emodin and its tribenzoyl derivative (TUTIN and CLEWER), T., 955; P., 99.
 monomethyl ether and its dibenzoyl derivative (TUTIN and CLEWER), T., 952; P., 89.
Emodin, tetranitro-, and its compound with aniline (OESTERLE and STOKES-TOXOPÉUS), A., i, 888.
isoEmodin and its acetyl derivative (TSCHIRCH and BROMBERGER), A., ii, 528.
Emodinycollic acid, salts and derivatives of (OESTERLE and STOKES-TOXOPÉUS), A., i, 888.
Emplectite (PRIWOZNIK), A., ii, 951.
Emulsion, action of heat on (BELLIAN and COMPTON), A., i, 592.
 hydrolysis of amygdalin by (ROSENTHALER), A., i, 99.
 action of, on alcoholic gentiophyllate (BOURQUELOT and BRIDEL), A., ii, 1053.
Emulsions, olive oil-water (WERNER), A., ii, 194.
 oil-water, stability of (HATCHEL), A., ii, 1068.

Emulsions, applicability of the gas laws to (LIVIN), A., ii, 861.
 viscosity of (BANCHLIN), A., ii, 586.
Enactin, chemistry of (LOCKEMANN), A., ii, 916.
Energy, theory of photosynthetic transformation of (TAVERT), A., ii, 451.
 influence of intake of food on the production of (GIGON), A., ii, 741.
 changes in sleeping children (HOWLAND), A., ii, 1005.
Enzyme, Bulgarian, action of, on proteins (BERTRAND), A., ii, 140.
 action of the, on proteins and amino-compounds (EFFRONT), A., ii, 61, 319.
 action of the, on monobasic acids (BERTRAND and VEILLON), A., ii, 221.
 hydrolytic, in sweet almonds (TONZOTTI), A., ii, 525.
 producing acetaldehyde in bitter wines (VOLKERT), A., ii, 915.
 ameclastic (GALEOTTI), A., ii, 131.
Enzymes, chemical composition and formation of (V. EULER and KILBERG), A., ii, 320.
 nomenclature of (V. EULER), A., i, 1051.
 action of ultra-violet light on (CHAUDRON and MAZOUZ), A., i, 758.
 determination of the number of, in a liquid (ACHALME and BRESSON), A., i, 172.
 influence of temperature on (GRAMENITZKI), A., i, 98.
 influence of viscosity on the activity of diastatic (ACHALME and BRESSON), A., i, 591; (ACHALME), A., i, 592.
 inactivation of (PORTER), A., i, 98.
 synthesis of fats by (DUNLAP and GIERERT), A., i, 1054.
 composition of hydrogen peroxide by (WAENTIG and SICHEL), A., i, 759.
 cleavage of nucleins by (AMBERG and JONES), A., i, 823.
 cleavage of nucleic acids by (AMBERG and JONES), A., i, 824.
 hydrolysis of trioses and stachyose by (BIERRY), A., i, 354.
 influence of, on the respiration of plants (LWOFF), A., ii, 641.
 reactions between, and anti-enzymes (JACORY), A., i, 935.
 of the alimentary canal, action of, on gelatin (MINAMI), A., ii, 810.
 of blood, influence of poisons on (DUNCAN and JODLBAUER), A., ii, 756.
 of the brain (WROBLEWSKI), A., ii, 627.

C. ii.

Enzymes, digestive, from *Colaspidea* (BOUKOURX), A., ii, 214.
 hepatic, influence of fats on the activity of (CHOAY), A., ii, 747.
 of intestinal juice (LONDON and KEYM), A., ii, 1060.
 of leucocytes (TSCHEERNORIEKI), A., ii, 1108.
 peptolytic, in the gastric juice (KUTSKER and PULVERMACHER), A., ii, 513.
 of gastric contents in cancer (HALL and WILLIAMSON), A., ii, 310.
 in parasitic worms (ANDERHALDEN), A., ii, 1009.
 proteoclastic, study of (KOBEL; FERNBACH and SCHOEN), A., i, 824.
 of invertebrates (SELLIER), A., ii, 1113.
 detection of, by means of elastin (ANDERHALDEN and KIESWEITER), A., ii, 999.
 reduction (BACH), A., i, 412, 759.
 respiration, of plants (ZALESKI), A., ii, 323.
 of yeast, activity of (EULER and KULLBERG), A., ii, 817.

 by catalysis (SABATIER and MAILLET), A., i, 258, 416.
 by Fischer's method (PIERRE), A., ii, 623.

- Ethane, 1,1-dichloro-**, pyrogenic decomposition of (NICODÉMUS), A., i, 345.
- Ethane, 1-fluoro-2,2,3,3-tetrabromo-**, *as* 1,1-difluoro-2,2,3,3-tetrabromo-, *as* 1,1-difluoro-2,2,3,3-tetrabromo-, and *as* 1,1-difluoro-2,2,3,3-tetrabromo- (SWARTZ), A., i, 763.
- Ethano-**, sodium derivative, action of phenylcarbamide on (STRINKOFF and DARGA), A., i, 230.
- Ethanesulphonic acid**, yttrium salt (PRATT and JAMES), A., ii, 893.
- Ethylcyclohexene** (LENADEFF), A., i, 26.
- Ether**, C_2H_5OCl , from *as* 2,2-hexachloro- Δ^2 -butylene and sodium ethoxide (NICODÉMUS), A., i, 346.
- Ether**. See Ethyl ether.
- Ethers**, constitution of compounds of bromine with (TSCHELINZEFF), A., i, 415.
- Ethers**, basic properties of the oxygen of (TSAKALOTOS), A., i, 514.
- Ethers**, formation of oxonium dibromides of (TSCHELINZEFF and KONGWALOFF), A., i, 256.
- Ethers**, action of, with benzophenone (LAFRANCO and CHIRIFFI), A., i, 65.
- Etheral oils**. See Oils, vegetable.
- Ethoxyacetic acid**, menthyl derivative of (KILBORN), A., i, 137.
- Ethoxyacetic acid**, ethyl ester, formation of (BLAISE and PICARD), A., i, 349.
- Ethoxyanthranilic acid** (LESSER), A., i, 456.
- Ethoxybenzenes 2-chloronaphthalene** (CHARRIER and FERRARI), A., i, 1046.
- Ethoxybenzenes 2-naphthol** (CHARRIER and FERRARI), A., i, 1046.
- Ethoxybenzimidazole**, diacetyl derivative (ELKS, METTE, and SCHUSTER), A., i, 193.
- Ethoxybenzoyl cyanide** (VORLANDER, FRIEDBERG, VAN DER MERVE, ROSENTHAL, HUTCH, and V. BODECKER), A., i, 866.
- Ethoxy 3-benzyl- α -pyrone 5-carboxylic acid**, ethyl ester (TIDLE and THORPE), T., 2201.
- Ethoxyisobutyric acid** (BLAISE and PICARD), A., i, 260.
- Ethoxyisobutyric acid**, and *as* 2-ethoxyisobutyric acid (STROEMER, FRIEDBERG, BRATTON, and NEUKEL), A., i, 236.
- Ethoxycinnamic acid**, ethylchlorohydrin ester (FARBENFABRIKEN VORM. F. BAYER & CO.), A., i, 858.
- Ethoxy- α -dimethylacetacetic acid**, ethyl ester, and its derivatives (SOMMELET), A., i, 109.
- Ethoxydimethylaminophenyl sulphide**, ammonium sulphate of (PARSONS and SMILES), T., 616.
- Ethoxydiphenyl-3-methyl-4-quinazolinone**, 4-amino-, and 4-amino-7-acetylaminos- (ROBERT, GORTNER, and AMEND), A., i, 551.
- Ethoxydiphenylphthalide** (MEYER and FISCHER), A., i, 723.
- Ethoxydiphenylsulphone disulphide** (FRIES and VOIGT), A., i, 556.
- Ethoxydiphenylsulphone-2-sulphinic acid** and its sodium salt (FRIES and VOIGT), A., i, 556.
- Ethoxydiphenylsulphone-2-sulphonic acid** and its anilide (FRIES and VOIGT), A., i, 557.
- Ethoxydiphenylsulphone-3-sulphonyl bromides and chloride** (FRIES and VOIGT), A., i, 556.
- Ethoxy- α -ethylacetacetic acid**, ethyl ester, and its pyrazolone derivative (SOMMELET), A., i, 109.
- Ethoxy- α -ethylbutyric acid** (BLAISE and PICARD), A., i, 260.
- Ethoxyheptane** (BLAISE and PICARD), A., i, 260.
- Ethoxyheptyl chloride** (BLAISE and PICARD), A., i, 260.
- Ethoxylactamides** (*lactophenins*), 2-nitro-, and 2,6-dinitro-, and nitrate of the latter (ELKS and METTE), A., i, 192.
- Ethoxy methylacetacetic acid**, ethyl ester, and its pyrazolone derivative (SOMMELET), A., i, 109.
- Ethoxy 8-methyl- Δ^2 -amylene** (KILNER and KRAWKOROFF), A., i, 636.
- Ethoxymethylfurfuraldehyde** and its phenylhydrazine and *p*-bromophenylhydrazine (COOPER and NUTTALL), T., 1197, P., 134.
- 4 or 5-Ethoxymethylglyoxaline** and its hydrogen oxalate (LYMAN), T., 678.
- Ethoxymethyl isopropyl ketone** and its semicarbazone (SOMMELET), A., i, 109.
- Ethoxymethylpyromucic acid** and its silver salt (COOPER and NUTTALL), T., 1198.
- Ethoxy-1-naphthaldehyde**, derivatives of (SACHS and BRILL), A., i, 719.
- Ethoxy-1-naphthylhydroxyacetone nitrile** (SACHS and BRILL), A., i, 719.
- Ethoxyphenylaceanthraphenazonium chloride** (LIEBERMANN and ZUFFA), A., i, 387.
- Ethoxyphenylaceanthraphenazonium chloride** (LIEBERMANN and ZUFFA), A., i, 387.
- Ethoxy- α -phenyl- γ -anisyl- Δ^2 -heptadien- α -one, 3-bromo-** (BAUER and DIETELZ), A., i, 881.

- p*-Ethoxyphenylcarbamie acid, trichloroisopropyl ester (VEREINIGTE CHININ-FABRIKEN ZIMMER & Co.), A., i, 118.
- p*-Ethoxyphenylethyl alcohol (ARTEN-GESSELLSCHAFT FÜR ANILIN-FABRIKATION), A., i, 857.
- o*-Ethoxyphenylethylamine (FARBEN-FABRIKEN VORM. F. BAYER & Co.), A., i, 629.
- m*-Ethoxyphenylethylamine hydrochloride (FARBENFABRIKEN VORM. F. BAYER & Co.), A., i, 629.
- m*-Ethoxyphenylethylidimethylamine (FARBENFABRIKEN VORM. F. BAYER & Co.), A., i, 629.
- m*-Ethoxyphenylethyltrimethylammonium chloride and methiodide (FARBENFABRIKEN VORM. F. BAYER & Co.), A., i, 629.
- p*-Ethoxyphenylglyoxylic acid and its derivatives (VORLÄNDER, FRIEDBERG, VAN DER MERVE, ROSENTHAL, HUTH, and V. BODECKER), A., i, 866.

- α -(or β)-Ethoxy- β -1:2-triphenyl-3-ethylhydrazimethylene (KASSOW and BURMEISTER), A., i, 820.
- Ethyl alcohol, refraction and dispersion by (MERCZYNG), A., ii, 574.
- absolute, specific gravity of (KAILAN), A., i, 939.
- and acetaldehyde, the system (DE LÉWU), A., ii, 870.

- Ethyl alcohol, acetic acid, ethyl acetate and water, equilibrium between and the influence of hydrochloric acid on the system (JONES and LAPWORTH), T., 1427; P., 143.
- ethyl ether and water, equilibrium in the system (HORIBA), A., ii, 592.
- and sulphuric acid, equilibrium and the action between (KREMAN), A., ii, 28.
- and water, boiling points of mixtures of (MARILLER), A., i, 512.
- influence of water on the boiling point of, at various pressures (WATSON and MERRIMAN), T., 997; P., 105.
- influence of temperature on the boiling water value of (JONES and LAPWORTH), T., 917; P., 100.
- influence of, on reactions in heterogeneous systems (JASANYI and JABONSKI), A., ii, 27.
- equilibrium of, with fats (VANDELDE), A., i, 515.
- influence of, on protein metabolism (SALANT and RIEGER), A., ii, 111.
- action of, on toluene-*p*-diazoniobenzene oxide (ROBERTS and ALLEMAN), A., i, 369.
- amount of, excreted by the animal organism (VOLTZ and BAUMANN), A., ii, 218, 1011.
- hydrochloride, heat of hydrolysis of (JONES and LAPWORTH), P., 14.
- distinction between, and methyl alcohol (KLEIN), A., ii, 519.
- colorimetric detection of, in presence of acetone (AGELHON), A., ii, 100.
- detection of small quantities of a fermentation (KLOCKER), A., ii, 941.
- estimation of the vapour of (BUTLER), A., ii, 1036.
- estimation of, in wine (DUBREUIL and PHILIPPE), A., ii, 662.
- Ethyl alcohol, β -amino-, from benzene (FRIER), A., i, 771.
- Ethyl ether, ethyl alcohol and water, equilibrium in the system (HORIBA), A., ii, 592.
- equilibrium of, with hydrosulphuric acid, with chlorine, and with bromine (McINTOSH), A., i, 256.
- physical properties of mixtures of sulphuric acid and (POUNT), T., 698.
- and anthraquinone, the system (SMITH and TREUB), A., ii, 111.
- degradation by means of (STAB), A., ii, 269.
- use of, in analytical separation (MYLIUS), A., ii, 444; (MULLER and HÜTTNER), A., ii, 549.

- Ethyl ether**, estimation of traces of water in (TYRRE), P., 142.
- Ethyl ether**, diisobromide, and diisodibromide (SWARTS), A., i, 763.
- Ethyl ether** narcosis, effect of, on body temperature and carbohydrate metabolism (GRUNE), A., ii, 503.
- Ethyl acetate**-*o*-azobenzene-*p*-acetylic acid (BULOW and HAAR), A., i, 139.
- Ethylamine** salts, and compound of, with carbon tetrabromide (DERN and DEWEY), A., i, 915.
- uranyl phosphate (BARTHE), A., i, 558.
- Ethylamine-*p*-sulphobenzoic acid** and its derivatives (KASTLE), A., i, 201.
- Ethylacetolymethyl-3-methylbenzoic acid**, 2-hydroxy-, and its sodium salt (ANILINFABRIK- & EXTRACT-FABRIKEN VORM. J. R. GEIGY), A., i, 978.
- Ethylammonium nitrite** (RAY and HAKKITT), T., 1470; P., 72, 122.
- omichloride (GUTHRIE and MAISON), A., i, 19.
- Ethylaniline-1-phenyl-3-methylpyrazole**, 4-amino-, and its hydrochloride and benzoyl derivatives (MICHAELIS and ABRAHAM), A., i, 1038.
- Ethylanthranol-9** (SCHOLL, POTTSCHWATSCHEG, and LENKO), A., i, 1008.
- Ethylanthraquinone**, and 1-amino-, 1-oxido-, and 1-nitro- (SCHOLL, POTTSCHWATSCHEG, and LENKO), A., i, 1008.
- Ethylanthrone-9** (SCHOLL, POTTSCHWATSCHEG, and LENKO), A., i, 1008.
- Ethylbeocerin** (SCHOLTZ), A., i, 913.
- Ethylbenzanilide**, *β*-chloro- (V. BRAUN and NIECKE), A., i, 747.
- Ethylbenzene**, *α*-chloro- (PICKARD and KENYON), T., 71.
- Ethylbenzidine** (RASSOW and BECKER), A., i, 933.
- Ethylbenzonitrile** (VORLANDER, FRIEDBERG, VAN DER MERVE, ROSENTHAL, HUTT, and V. BODECKER), A., i, 846.
- Ethylbenzophenone-3'-carboxylic acid** (SCHOLL, POTTSCHWATSCHEG, and LENKO), A., i, 1003.
- p*-Ethylbenzoyl cyanide** (VORLANDER, FRIEDBERG, VAN DER MERVE, ROSENTHAL, HUTT, and V. BODECKER), A., i, 866.
- Ethyl-3,4-dibromocyclohexane**, *αβ*-dibromo- (LEBEREFF and SKAVERSKAJA), A., i, 959.
- Ethylacetoxymethyl ketone** and its derivatives (BLAINE and PICKARD), A., i, 175.
- Ethylacetylsuccinate**, dichloro- (BYLDEX), A., i, 846.
- α*-Ethylbutyric acid**, 3-hydroxy-, synthesis of (MATSCHEWITSCH), A., i, 260.
- α*-Ethylbutyrylcarbamid acid**, *α*-bromo-, phenyl ester (FARBENFABRIKEN VORM. F. BAYER & CO.) A., i, 116.
- α*-Ethylbutyrylcarbamid acid**, *α*-bromo-, See Adaline.
- Ethylpocamphoric acid**, *cis*- and *trans*-forms, synthesis of, and dihydroxy- (KOMPPA and RUTALA), A., i, 381.
- Ethylcarbamid acid**, *α*-hydroxy-*ββ*-dichloro- (OMRI and CESMANO), A., i, 943.
- Ethylcarbamidcarboxylic acid**, esters of (MAUGEN), A., i, 358.
- m*-Ethylcarbonatobenzoic acid** (DANIEL and NIERENSTEIN), A., i, 371.
- 4-Ethylcarbonatobenzoic acid**, 3-nitro-, and its acid chloride (FRANCIS and NIERENSTEIN), A., i, 643.
- 2-*α*-Ethylcarbonatobenzoylexybenzoic acid** (EINHORN, HAAK, V. BACH, LAGSCH, and ROTHLAFF), A., i, 302.
- 2-*p*-Ethylcarbonatobenzoylexybenzoic acid**, 4-nitro- (FRANCIS and NIERENSTEIN), A., i, 644.
- 3-*p*-Ethylcarbonatobenzoylexybenzoic acid** (FRANCIS and NIERENSTEIN), A., i, 644.
- 4-*p*-Ethylcarbonatobenzoylexybenzoic acid**, 3-nitro- (FRANCIS and NIERENSTEIN), A., i, 643.
- Ethylcarbonate-*α*-carboethoxyaminoacetophenone** (MANNICH and HAHN), A., i, 649.
- β*-Ethylcarbonate-*α*-ethylcinnamic acid**, ethyl ester (HALLER and BAUER), A., i, 300.
- Ethylcarbonate-*Δ*¹-cyclohexene** (HALLER and BAUER), A., i, 300.
- β*-Ethylcarbonate-*α*-methylcinnamic acid**, ethyl ester (HALLER and BAUER), A., i, 300.
- 4-Ethylcarbonate-*m*-nitrobenzoic acid** (DANIEL and NIERENSTEIN), A., i, 371.
- α*-Ethylcarbonate-*α*-phenyl-*Δ*¹-butylene** (HALLER and BAUER), A., i, 300.
- α*-Ethylcarbonate-*α*-phenyl-*Δ*¹-isobutylene** (HALLER and BAUER), A., i, 299.
- p*-Ethylcarbonatophenylglyoxylonitrile** (FRANCIS and NIERENSTEIN), A., i, 644.
- α*-Ethylcarbonate-*α*-phenyl-*Δ*¹-propylene** (HALLER and BAUER), A., i, 300.
- p*-Ethylcarbonate-*βββ*-trimethyl-*Δ*¹-pentene** (HALLER and BAUER), A., i, 300.
- α*-Ethyl-*α*-coumaric acid** (FRIEIS and VOLK), A., i, 204.

- Ethylacetanilide salts** (HENZELING), A., i, 21.
- Ethylaldehydropoacemphoric acid** (KOMPFA and RUTALA), A., i, 331.
- 4-Ethylidiphenylmethane 2'-carboxylic acid** (SCHOLL, POTSCHEWAUSCHEG, and LENKO), A., i, 1608.
- Ethylene**, fusibility curve of, and methyl ether (BAUME and GERMANN), A., i, 830.
- action of hypochlorous acid on derivatives of (UMNOVA), A., i, 249.
- derivatives, isomerism in (ERLENMEYER), A., i, 780.
- dibromide, equilibrium of, with aluminium bromide (MENSCHUTKIN), A., i, 1.
- Ethylene**, trichloro-, pyrogenic decomposition of (NICODEMUS), A., i, 345.
- aa*-difluoro- β -bromo-, and *aa*-difluoro- $\beta\beta$ -dibromo- (SWARTS), A., i, 763.
- Ethylenebis-5-propylbarbituric acid** (REMY), T., 623; P., 73.
- Ethylenediamine**, tetra-acetyl derivative of (FRANCHIMONT and DUBSKY), A., i, 529.
- Ethylenediammonium** auri-bromide and chloride (GUTHRIE and OBERMAIER), A., i, 424.
- osmichloride (GUTHRIE and MAISC), A., i, 19.
- aa*'-Ethylenedi-iminoisobutyric acid and its ethyl ester, hydrochlorides of (SCHLESINGER), A., i, 427.
- aa*'-Ethylenedi-iminodisobutyric acid and its copper salt (SCHLESINGER), A., i, 427.
- aa*'-Ethylenedi-iminodisobutyronitrile hydrochloride (SCHLESINGER), A., i, 427.
- a*-Ethyleneglutaconic acid, *cis*- and *trans*-semianilides of (THOLE and THORPE), T., 2231.
- cis*-*a*-Ethyleneglutaconic acid and its silver salt and anhydride (THOLE and THORPE), T., 2225.
- a*-Ethyleneglutaconicanhydride, semianilide of (THOLE and THORPE), T., 2233.
- 4(or 5)-Ethylglyoxaline**, β -amino-, formation of, from histidine, and its derivatives (EWINS and PYMAN), T., 339; P., 45.
- new synthesis of (PYMAN), T., 668; P., 91.
- physiological action of (DALE and LAIDLAW), A., ii, 137, 1017; (BARGER and DALE), A., ii, 217.
- β -hydroxy-, and its salts (WINDAUS and OPITZ), A., i, 753.
- γ -Ethylheptan-5-ol** and its oxime (ZERNER), A., i, 950.
- d*-Ethyl- α -hexylcarbinol** and its diacetyl gen phthalate, and brucine salt of the latter (PICKARD and KENYON), T., 60.
- l*-Ethyl- α -hexylcarbinol** and its diacetyl gen phthalate of, and its cinchonidine salt (PICKARD and KENYON), T., 60.
- a*-Ethylhydrohydrastinine** (FERRELL and LEHNER), A., i, 906.
- Ethylidenephthalidoxime** (LAWSON and STEELE), T., 1883.
- 3-Ethylindole**, β -amino-, and derivatives (EWINS), T., 20.
- physiological action of (LAWSON), A., ii, 1120.
- Ethylmalonylbenzidine** (REMY), T., 622.
- a*-Ethylorallylamino- α -phenylacetamide** (CLARKE and FRANCIS), T., 324.
- 8-*o*-Ethylcinnamic acid**, methyl ester of (STOKER, FRIDERICI, BRANTLEY and NECKEL), A., i, 297.
- γ -Ethylpentane- β -diol** (GAMBERG), A., i, 415.
- 9-Ethylphenanthrene** and *aa*-*aa*'-diethyl- (WILLGERODT and ALBERT), A., i, 882.
- Ethylpropylacetophenone** (DEWIL), A., i, 719.
- Ethylisopropylcarbinol**, rotation of (PICKARD and KENYON), P., 224.
- Ethylpropylsilicane**, dichloride of (DEN), A., i, 846.
- 3-Ethyl- α -pyrone**, 6-chloro-, and 6-hydroxy- (THOLE and THORPE), T., 2227.
- 1-Ethylpyrrolidine** and its salts (BRAUN), A., i, 563.
- 1-Ethyltetrazole** and its phthalide (OLIVERI-MANDALA and ALBERT), A., i, 243.
- 4-Ethylthiolbenzoic acid**, 2-chloro- (LESSER), A., i, 456.
- 2-Ethylthiol-1-phenyl-4-anisylidenehydantoin** (WHEELER and BRANTLEY), A., i, 501.
- 2-Ethylthiol-1-phenyl-4-benzylhydantoin** (JOHNSON and BRANTLEY), A., i, 813.
- 2-Ethylthiol-1-phenyl-4-benzylidenehydantoin** (WHEELER and BRANTLEY), A., i, 500.
- 2-Ethylthiopyrimidine-5-acetic acid** and 6-amino-, γ -lactam of, and 6-ethyl ester (JOHNSON, PERKINS and AMBLER), A., i, 575.
- 2-Ethylthio-3-phenyl-4-benzylidenehydantoin** (WHEELER and BRANTLEY), A., i, 501.
- Ethyltolene**, 3:5-dichloro-4:5:6-trichloro- (AUWERS), A., i, 384.

acetylal. See *Cinrole*.
acetylal and bromo-, dibromide (PATRY, V. BUTTLAR, and LOCKMANN), A., i, 785.

- Fish**, constituents of (VILHJELM), A., ii, 305.
- proteins in the ovary of (MCCORMICK), A., ii, 415.
- toxicity of the ovaries of (MCCORMICK), A., ii, 421.
- poisons, method of action of (PETERS), A., ii, 638.
- Fishes**, teleostean, production of gas in (WOODLAND), A., ii, 1113.
- Flame**, electric, behaviour of carbon dioxide and mixtures of it (MUTHMANN and SCHAEFER), A., ii, 790.
- formation of hydrogen cyanide in the (MOSCICKI), A., ii, 1057.
- Flames**, radioactive properties of hot temperature flames (CARLIER), A., ii, 1046.
- velocity of ions of salts of alkali metals in (WILSON), A., ii, 572.
- ammonia and nitric oxide in (BROWN), A., ii, 483.
- Flavanthron**, new synthesis of (EISENBERG), A., i, 794.

- Flint-stone** (*schemozep*), analysis of (HAGGER), A., ii, 503.
- Florides**, colouring-matters of the (KILIN), A., ii, 1024.
- green and yellow dyes of (MARCH-LEWAKI), A., ii, 1125.
- Floor**, bleaching of (HAMILL; MONIER-WILLIAMS), A., ii, 1001.
- Fluidity of binary mixtures** (DRUCKER and KASSEL), A., ii, 573.
- of mixed liquids, relation between viscosity and (DINGHAM and WHITE), A., ii, 558.
- Fluorac**, synthesis of (FERREARIO and NEUMANN), A., i, 316.
- Fluorane**, freezing-point curves of mixtures of, with nitro-compounds (NEUMANN, DIACHENDORFER, FRANKOVIC, HAUKE, HONEL, SCHOLLE, and VALENTA), A., ii, 871.
- magnesium derivative of (GRIGNARD and OPORTOT), A., i, 538.
- Fluorenone** (*diphenylene ketone*), isomerism of the red and yellow forms of (STOBA), A., i, 651.
- Fluorenonehydrasone** (WIELAND and ROSEAU), A., i, 572.
- Fluorenoneketazine** (WIELAND and ROSEAU), A., i, 572.
- Fluorenyldiphenylcarbinol** (GRIGNARD and OPORTOT), A., i, 538.
- tert.*-**Fluorenylstyreneol** and its derivatives (GRIGNARD and OPORTOT), A., i, 538.
- Fluorescein**, fluorescence and absorption of (KIRBY), A., ii, 833.
- Fluorescence**, theory of (STARCK), A., ii, 786.
- of cinchona alkaloids (RAHE and MARSHALL), A., i, 741.
- of hydrocarbons and their derivatives (STRIBER and EBERT), A., ii, 562.
- Fluorine**, magnetic properties of (PASCAL), A., ii, 461.
- Hydrofluoric acid**, action of, on metallic oxides (VAN HAAGEN and SMITH), A., ii, 894.
- Fluorides**, detection of (BROWNING), A., ii, 1030.
- estimation of (STARCK), A., ii, 436.
- estimation of, in silicates (KLEIN-STUCK), A., ii, 1026.
- estimation of, in water (GARTNER and MOUREU), A., ii, 301.
- Fluorone derivatives** (POPE and HOWARD), T., 545; P., 52.
- Gly agarie** (*Amanita muscaria*), chemistry of (ZELLNER), A., ii, 425.
- Leucine**, protein metabolism of the (LINTHAY), A., ii, 1115.
- Log particles**, electric charge on (PITZBRAM), A., ii, 263.
- Food**, value of rice, as a (ARON and HOCKON), A., ii, 623.
- influence of intake of, on gaseous metabolism and energy production (GIGON), A., ii, 741.
- Food**, presence of allantoin in (ACKROYD), A., ii, 306.
- detection of benzoic acid in (POLENSKY; FRIESE), A., ii, 1142.
- detection of boric acid in (v. FELLENBURG), A., ii, 657.
- dressed, detection of starch in (CARLES), A., ii, 340.
- estimation of fat in (NEUMANN), A., ii, 1040.
- estimation of formic acid in (FINCKE), A., ii, 232.
- Formaldehyde**, preparation of, by the contact process (LE BLANC and PLASCHKE), A., i, 176.
- formation of glycogen from, in the liver (SCHNIEDORFF and GREER), A., ii, 306; (GRUE), A., ii, 410.
- effect of ultra-violet light on (PITZBRAM), A., i, 420.
- influence of the vapour of, on the organism (LWANSOFF), A., ii, 419.
- action of, on potassium cyanide (FRANZEN), A., i, 323.
- action of, on Witte's septon (SCHRYVER), A., i, 246.
- action of, on petroleum distillates (NANTIKOFF and MALJALOFF), A., i, 249.
- action of, on plants (BOKORNY), A., ii, 1021.
- reactions of, with unsaturated fatty acids (FOLIX), A., i, 765.
- gaseous, action of, on green plants (GRAFE), A., ii, 818.
- estimation of (HERMANN), A., ii, 161.
- estimation of, by the ammonia process (BEYTHIES, HEMPEL, SIMMICH, SCHWERDT, and WISEMANN), A., ii, 776.
- Formic acid**, formation of, in katabolism of fatty acids (DAKIN and WAKEMAN), A., ii, 628.
- anhydrous, preparation and properties of (GARNER, SEXTON, and PARKER), A., i, 831.
- velocity of reaction of bromine on (JOSEPH), A., ii, 384.
- catalytic decomposition of (SABATIER and MAILHE), A., i, 515.
- esterification of (SABATIER and MAILHE), A., i, 416.
- compounds of, with unsaturated acids (FARBWERKE VORM. MEISTER, LUCIEN, & BRENING), A., i, 107.
- interaction of, and cellulose (CHOW and BEVAN), T., 1450; P., 149.

- Formic acid**, fermentation of, by *Bacillus kiliense* (FRANZEN and GREVE), A., ii, 60.
 aluminium, chrominum, and iron salts of (MUTH), A., i, 257.
 dysprosium salt of (JANTSCH and ONL), A., ii, 493.
 sodium salt, action of organic acids on (OECHSNER DE CONING), A., i, 764.
 salt of, with *o*-aminophenol (SUIDA), A., i, 284.
Formic acid, cyano-, ethyl ester, condensation of hydrazoic acid with (OLIVERI-MANDALA), A., i, 337.
Formic acid, anhydrous, reaction of, with nitrates (QUARTAROLI), A., ii, 1079.
 estimation of (FRANZEN and EGGER), A., ii, 446.
 estimation of, in foods (FINCKE), A., ii, 232.
 See also Orthoformic acid.
Formylacetic acid, *o*-chloro-, ethyl ester, and its salts and derivatives (WISLICENUS), A., i, 108.
Formyldeoxybenzone, desmotropism and derivatives of, and bromo- (WISLICENUS and RUTHINO), A., i, 303.
Formyldimethyloctandienol (FARBEN-FABRIKEN VORM. F. BAYER & CO.), A., i, 102.
Formylglutamic acid, and bromo-ethyl esters, and their isomerides and derivatives (WISLICENUS and V. WRANGELL), A., i, 521.
Formylguanidine, and its bromo-derivative (THAUBER), A., i, 115.
Formylhomopiperonylamine (DECKER), A., i, 906.
Fox, analyses of the urine of the dog, coyots and (HAWK), A., ii, 308.
Fractionating apparatus, an electrically heated vacuum (BAILEY), A., ii, 256.
 column (BAUM), A., ii, 467.
Frangula-emodin, constitution of (OESTERLE and SYPKENS-TOXOPÉTS), A., i, 887.
Fraxin in *Diervilla lutea* (CHARAUX), A., ii, 1023.
Freezing-point curves of gaseous mixtures (BAUME), A., ii, 581.
Friedel-Crafts' reaction (BÖESEKEN), A., i, 531; (BÖESEKEN and KONING), A., i, 532; (HALLA), A., i, 784.
Frog's heart. See Heart.
Fruit juices, estimation of salicylic acid in (VIERHOUT), A., ii, 775.
Fruits, oxydase in (BASSETT and THOMPSON), A., ii, 425.
 substances yielding hydrogen cyanide in the seeds of (HUBER), A., ii, 1022.
Fruits, preserved, proportion of lactone to levulose in (FAVRE and KRIEGER), A., ii, 1036.
 ripening, tannin in (LLOYD), A., ii, 918.
 and their juices, estimation of tartaric acid in (WARCOLLIEN), A., ii, 1036.
Fucose, stereochemical configuration of (HUDSON), A., i, 355.
Fulgic acid (STOBBE), A., i, 374.
Fulgides (STOBBE), A., i, 373.
Fulminic acid (WIELAND), A., i, 427.
 action of hydrogen sulphide on (CAMBI), A., i, 429.
Fumaric acid, synthesis of, from acetylene di-iodide (KEISER and M. MASTER), A., i, 949.
 isomerism of, and isoleic acid (GLAUMANN), A., i, 261.
 oxidation of, by animal tissues (BATELLI and STERN), A., ii, 412.
 methenyl esters of (HILLMICH), A., ii, 223; P., 6.
Fumaronitrile (KEISER and KNEBEL), A., i, 949.
Fungi, pentosans in (WHEELER and TOLLENS), A., ii, 63.
 fixation of nitrogen by (LEWIS), A., ii, 1019.
 lower, pentosans in (DOX and NEUBAUER), A., ii, 644.
 phytase in (DOX and GOLDEN), A., ii, 1022.
 mould, behaviour of, towards organic acids (HERZOG and SALAMON), A., ii, 915.
 behaviour of, towards organic acids (HERZOG and RIPKE; HERZOG, RIPKE, and SALAMON), A., ii, 915.
 parasitic, erepsin in (REED and STARR), A., ii, 916.
 wood, estimation of pentosans and methylpentosans in (HUBA and TOLLENS), A., ii, 645.
Fungicide, colloidal copper as a Vermorel and DANTONY), A., ii, 647.
Funnal, improved (BLACKMAN), A., ii, 796.
 new (BLACKMAN), A., ii, 1081.
 support for (BLACKMAN), A., ii, 1081.
Furan-2-carboxylic acid, 5-amino-, cyano-, and its derivatives (PRAKMAN), A., i, 457.
Furfuraldehyde and water, density and refraction of the system (SCHWEIGER), A., ii, 949.
 reduction of, by yeast (LINTNER and VON LIEBIG), A., ii, 816.
Furfuraldehyde-*α*- and *β*-naphthylhydrazones (SANTI), A., i, 1030.

Perfuraldhyde- β -ketylhydrazones (SANTAL, A., i, 1690).
Perfurylideneanamyldiacetone. See β -styryl- β -furyldiviny ketone.
Perfurylidenehydantoin (WHEELER and HOFFMAN, A., i, 499).
Parasae for sealed tubes (BENNER, A., ii, 575).
muffle, for the laboratory (PAZZI-EMORI, A., ii, 269).
Parasae gas, estimation of the constituents of (LÁZLO, A., ii, 929).
Paralactonic acid, behaviour of, in the body (FRIEDMANN, A., ii, 910).
Paralactylic acid, behaviour of, in the body (FRIEDMANN, A., ii, 910).
Paralallylcarbinal (SEMENTOFF and KOSCHOFF-DOBRYNIA, A., i, 1907).
Paral oil, detection of, in brandy (HELLOG, A., ii, 446).

G.

gabbro magma, fusion of (ANDERSEN, A., ii, 47).
gadolinite earth, new element from the (KRAM, A., ii, 115).
gajite TITANI, A., ii, 498.
Galactophosphoric acid, calcium salt (NEURZG and KRETSCHMER, A., i, 337).
galactose, action of barium hydroxide on (FISON, A., i, 423).
Galactose on berries of ivy (LIPP-MANN, A., ii, 142).
galactose α -carboxyanilide and its barium derivative (IRVING and HYNID, T., 163, P., 9).
Galanthus nivalis (snowdrop), carbohydrates of the foliage leaf of (PARKIN, A., ii, 1127).
gallipoline and its salts (TROGER and RUNGE, A., i, 483).
gallamide trimethyl ether, nitro (HARDING, T., 1595).
gallein, β -trichloro, and its derivatives (ORNDORFF and DELBRIDGE, A., i, 747).
galleincarbinolcarboxylic acid, β -trichloro, and its derivatives (ORNDORFF and DELBRIDGE, A., i, 738).
galleic acid, colouring-matters from (EHRMANN, A., i, 459).
trimethyl ether, action of nitric acid on (HARDING, T., 1592; P., 213).
gallic acid, pyrogenetic decomposition of (KUNZ-KRAUSZ and MANICK, A., i, 130).
gallium, nature of, in starch-syrup (GATTERBAUER, A., i, 837).

Gallotannic acid, chemical constitution of, and its potassium salt (PANIKER and STYANOV, T., 1519; P., 213).
Galleoylformic acid (FRANCIS and NIERENSTEIN, A., i, 644).
Gall stones, occurrence of deoxycholic acid in (KUSTER, A., ii, 57).
Gallite. See *Allium sativum*.
Garnet (SMITH, A., ii, 501).
from Nardinia (SERRA, A., ii, 123).
Gas, history of the name (V. LIPP-MANN, A., ii, 199).
dynamics of a, in motion (JEITNER, A., ii, 579).
theory of solution and heat of dissolution of a (COLSON, A., ii, 1066).
rate of dissolution of a, in a liquid (COLSON, A., ii, 589).
equilibrium in a dissociating (STAFFORD and V. WARTENBERG, A., ii, 700).
electrolytic, chemical action of the electric discharge in (KIRKBY, A., ii, 462).
Gases from the sulfoni of larderello (POIERZZA and NORZI, A., ii, 1106).
analyses of, from mines (MOUREU and LEFAPE, A., ii, 1087).
enclosed in tektites (BROCK, A., ii, 292).
from the walls of heated tubes of glass, porcelain and silica (GUICHARD, A., ii, 396).
spectra of (DONALDSON, A., ii, 1042).
compound, separation of spectra in (STEAD, A., ii, 1041).
anode and cathode spectra of (STIKAD, A., ii, 830).
refraction and dispersion of light in (GRÜCHKE, A., ii, 349).
anomalous dispersion of light in (JULIUS and VAN DER PLAATS, A., ii, 449).
carriers of electricity in (BECKER, A., ii, 957).
ionisation of (TOWNSEND, A., ii, 355; (FRANCK and WESTPHAL, A., ii, 957).
effect of temperature on the (CLO, A., ii, 355).
in presence of non-radioactive substances (DE BROGLIE and BRIZARD, A., ii, 837).
by canal rays (SNEELIGER, A., ii, 958).
by chemical change (BAKER, A., ii, 244).
by light (CANNONIETTER, A., ii, 455).
by ultra-violet light (SACHS, A., ii, 246).

- Gases, ionisation by α -rays** (MOULIN), A., ii, 171.
 by the α -particles from polonium (TAYLOR), A., ii, 354.
 relation of valency to (MILLIKAN and FLETCHER), A., ii, 573.
 charges on ions in (TOWNSEND), A., ii, 686.
 mobility of ions in (REINGANUM), A., ii, 788, 837.
 behaviour of mixtures of, in the electric flame (MUTHMANN and SCHAIDHAUF), A., ii, 790.
 transformation of energy in photochemical reactions in (WARBURG), A., ii, 834.
 magnetic permeability of (ROOF), A., ii, 183.
 thermal conductivity of (KNUDSEN), A., ii, 368.
 specific heat of (THIBAUT), A., ii, 695;
 (DRUCKER), A., ii, 792.
 fusibility curves of mixtures of (BAUME and GERMANN), A., i, 830.
 determination of the density of (JAQUEROD and TOURNAIEN), A., ii, 189.
 kinetic theory of, and thermodynamics (BERTHOUD), A., ii, 578.
 molecular pressures of, in tubes (KNUDSEN), A., ii, 188.
 internal pressure of (LEDEU), A., ii, 792.
 condensation of two (BRINER), A., ii, 705.
 viscosity of (BINGHAM), A., ii, 372.
 determination of the solubility of (MOLES), A., ii, 473.
 solubility of, in mixed liquids (DRUCKER and MOLES), A., ii, 23.
 solubility of, in blood and serum (FINDLAY and CREIGHTON), A., ii, 211.
 of the argon group, physical constants of (CUTHBERTSON), A., ii, 108.
 viscosity of (REINGANUM), A., ii, 858.
 relation between atomic weight and viscosity for (RANKINE), A., ii, 87.
 dielectric cohesion of (BOUTY), A., ii, 458.
 combustible, quantitative analysis of (DE VOLDERE), A., ii, 329.
 heavy, ionisation of, by Röntgen rays (BEATTY), A., ii, 245.
 inert, purification of (GEHLHOFF), A., ii, 487.
 liquefied, binary mixtures of (BAGSTER), T., 1218; P., 141.
 heat of vaporisation of (ESTREICHER and SCHNERER), A., ii, 16.
- Gases, luminous, emission spectra of** (JUNGSMANN), A., ii, 82.
 rare, in thermal springs (M.), A., ii, 808.
 rarefied, conduction of heat through (SODDY and BERRY), A., ii, 221.
 from springs, ratio of argon to hydrogen in (WALTER), A., ii, 224.
 mechanism of exchange of, in plants (DU BOIS-REYMOND), A., ii, 503.
- Gas-absorption apparatus** for attachment to the tops of bottles of (GÖCKEL), A., ii, 328.
Gas-absorption flasks, device for making up a series of (RECKLEIN), A., ii, 238.
Gas analysis (WILHELM), A., ii, 652.
 principles of (DE VOLDERE), A., ii, 329.
 apparatus for (MOHE), A., ii, 19.
 burette for use in (GAWALOWSKI), A., ii, 651.
 calculation of results of (JELINEK), A., ii, 433.
- Gas burner, self-regulating** (HARTMAN), A., ii, 714.
Gas-generating apparatus (MOHE), A., ii, 200;
 (PREUSS), A., ii, 975.
Gas laws, applicability of the, to condensation (ILYIN), A., ii, 561.
Gas regulator for thermostat (STARR), A., ii, 199.
Gas wash-bottle, new (FETTER), A., ii, 268.
- Gaseous combustion** (BRITISH ASSOCIATION REPORTS), A., ii, 799.
Gaseous explosions (BRITISH ASSOCIATION REPORTS), A., ii, 792.
Gaseous mixtures, freezing-point curve of (BAUME), A., ii, 581.
- Gastric juice**, effect of copious and drinking on the secretion of (WILL and HAWK), A., ii, 214.
 peptolytic enzymes in the (KUTNER and PULVERMACHER), A., ii, 502.
 origin of the hydrochloric acid in (FITZGERALD), A., ii, 50.
 measurement of the acidity of the (MICHAELIS and DAVIDSON), A., ii, 505.
 secretion of, when the supply of chlorine is lessened (ROSEMAN), A., ii, 998.
 calf's, rennin and pepsin in (BACOCZY), A., i, 827.
- Gastro-intestinal juice**, action of on nucleic acids (LEVEN and MARGRECEANU), A., ii, 744;
 (SCHITTENHELM and WIENER), A., ii, 745.

- salts, action of dilute acids and salt solutions on (PROCTOR), A., i, 342.
inhibition by, in acids and bases (CHIARI), A., i, 590.
resorption of, from the small intestine (BRACH), A., ii, 1109.
swelling and contraction of (SPIRO), A., ii, 379.
methylation of (SERAUF and BÖRCHERS), A., i, 247.
action of enzymes of the alimentary canal on (MINAMI), A., ii, 810.
intestinal digestion of (MINAMI), A., ii, 810.
analysis of (HEXOLD), A., ii, 348.
estimation of (GRIFENHAGEN, KÖNIG, and SCHOLL), A., ii, 947.
stariness media, reactions in (LEAK-GASO), A., ii, 306.
oleosmine, derivatives of (MOORE), T., 123; P., 157.
 α -oleosmine and its salts and derivatives (MOORE), T., 1234; P., 157.
 α -oleosmine, and bromo-, and chloro-, and their salts and derivatives (MOORE), T., 123; P., 157.
osina, constituents of the root of (BRIDEL), A., ii, 426; (BURMANN), A., ii, 323.
osiolepin, alcoholic, action of emulsion on (BOUQUELOR and BRIDEL), A., i, 1053.
osinaldehyde, semicarbazone (PAULY, SCHÜBEL, and LOCKEMANN), A., i, 788.
di-*p*-nitrobenzyl mercaptal (PAULY, v. BUTTLAR, and LOCKEMANN), A., i, 786.
oseronium (WERNER), A., ii, 271.
otological time, measurement of, by means of the ratio of lead to uranium to minerals (HOLMER), A., ii, 579; (ZAMBONINI), A., ii, 959.
oserial and its derivatives (SEMMER and SCHOSBERGER), A., i, 475.
oseryl-*d*-glucoside and its tetraacetyl derivative (FISCHER and HELFERRICH), A., i, 802.
osmium, melting point and frequency of atomic vibration of (BILTZ), A., ii, 1097.
osum silver, quantitative analysis of (KORTE), A., ii, 155.
osination, influence of acidity on (FROMM), A., ii, 322.
osuced, of seeds (MAZE), A., ii, 141.
osergum oil, alcohol from (SEMMER and ZAAR), A., i, 313.
osalia and its hydrate (KRAFT), A., i, 734.
osad, choroid. See Choroid.
oshyroid. See Thyroid.
- Glands, physiology of (ASHER and FLACK), A., ii, 55.
mammary, production of lactose in (PATON and CATHCART), A., ii, 415.
Glauberite from Nancy (DUFFIELD), A., ii, 295.
Glaucodote, experiments with (REUTELL), A., ii, 723.
Glladin, refractive index of (ROBERTSON and GREAVES), A., i, 539.
hydrolysis of (OSBORNE and GURST), A., i, 697.
action of the pancreatic juice on (BAGLIONI), A., ii, 999.
estimation of (GREAVES), A., ii, 674.
Globulin, estimation of, by means of ammonium sulphate (WIKNER), A., ii, 1144.
Globulins, nature of (SCHREYER), A., i, 245.
Globulinsates of the alkaline earths, dissociation of (ROBERTSON), A., i, 406.
Glucinum, spectrum of (LECOMTE DE BOISBAUDRAN and DE GRAMONT), A., ii, 832.
separation of, and aluminium (WUNDER and CHÉLAIQUE), A., ii, 773.
 α -Glucodectol and its derivatives (PHILIPPE), A., i, 608.
 α -Glucodectonic acid, derivatives and metallic and alkaloidal salts of (PHILIPPE), A., i, 12.
 β -Glucodectonic acid, salts and derivatives of (PHILIPPE), A., i, 112.
 α -Glucodectose and its osazone and phenylhydrazone (PHILIPPE), A., i, 605.
Glucose-*p*-hydroxybenzoic acid (MAUTHNER), A., i, 547.
Gluconic acid, behaviour of, in the organism (SCHOLT), A., ii, 514.
 d -Gluconic acid, formation of, by *Bacterium mesentericus* (ALSHERO), A., ii, 317.
Glucosamine, formation of levulic acid from (HAMBERGER), A., i, 834.
glycogenetic property of (ROGOSKI), A., ii, 814.
 d -Glucosamina, derivatives of (IRVING, McNICOLL, and HYND), T., 250; P., 23.
Glucosalanids (IRVING and HYND), T., 166; P., 9.
Glucose protein in *Ascaris lumbricoides* (McCRUBBEN), A., ii, 415.
Glucosides, synthetic (FISCHER and HELFERRICH), A., i, 802.
effect of, on solutions of salts (GLOVER), T., 379.
antagonism of cholesterol to the action of, on the heart (KARACLOW), A., ii, 517.

- Glycinedithiocarboxylic acid, ester hydrogen ester and its barium salt (SIEGFRIED and WEIDENHAUSEN), A., i, 116.
- Glycocholic acid (LETSCHER), A., i, 116.
- Glycogen, formation of, from formaldehyde in the liver (SCHNEIDER and GREBE), A., ii, 306; GIBBS, A., ii, 410.
- formation of, in the liver (MULLER, HAUSER and HAFMANN), A., ii, 750.

- Glycogen, formation of, in the liver, influence of phloridzin on** (SCHÖNDOFF and SOCKNOW), A., ii, 306.
in the liver, relation of the kidney to (GEISWALD), A., ii, 130.
distribution of, in the liver (MACLEOD and PEARCE), A., ii, 219.
removal of, from the human subject (LEAK), A., ii, 215.
behaviour of, in the frog's ovary (BLAISTREU), A., ii, 811.
effect of extirpation of the suprarenals on (KAHN and STARKENSTEIN), A., ii, 415.
amount of, in yeast cultures (V. LEBENSTOFF), A., ii, 519.
- Glycol, $C_2H_4O_2$, from dimethylephedrine ammonium hydroxide, and its dibenzoate** (SCHMIDT), A., i, 562.
- Glycols, behaviour of, in the body** (MICKA), A., ii, 1014.
- Glycolaldehyde, bimolecular** (MCQUELLEN), T., 1327; P., 224.
- Glycollic acid, alkaline cupric salts of** (PICKERING), T., 1347; P., 192.
yttrium salt (PRATT and JAMES), A., ii, 881.
- Glycolysis** (LÖB and PULVERMACHER), A., ii, 54; (RONA and DOBLIN), A., ii, 619.
influence of phosphates on (LOU), A., ii, 504.
- Glycosuria.** See Diabetes.
- Glycoauric acid, preparation of** (JOLLES), A., i, 709.
biological properties of (PADERI), A., ii, 629.
limit of combination of, in rabbits (HÄMÄLÄINEN and SJÖSTRÖM), A., ii, 309.
derivative of, from the sugar beet (SMOLENSKI), A., ii, 428.
reaction, importance of, in infants' urine (MAYERHOFER), A., ii, 311.
detection of small quantities of (NEUREG and SANEYOSHU), A., ii, 1038.
- Glycidol, d-, and l-aminebutyric acid** (ABDERHALDEN, CHANG, and WERN), A., i, 527.
- Glycidylbenzene 2-sulphinic acid, 4-bromo-** (CLAASZ), A., i, 437.
- Glycyrrhizin, estimation of, in liquorice root** (ERIKSSON), A., ii, 346.
- Glyoxalcarboxylic acid, colloidal form of Nastrogel-oxazone of** (FENTON and WILKS), A., i, 324.
- Glyoxalinas (iminazoles), synthesis of** (WINDAUS and OPITZ), A., i, 752.
formation of (EVEREST and McCOMBIE), T., 1746; P., 209.
- Glyoxalinas, pharmacological action of halogen derivatives of** (GUNDERMANN), A., ii, 754.
- Glyoxaline-4, or 5-acetic acid and its salts and ethyl ester** (PYMAN), T., 690.
- Glyoxaline-4, or 5-acet thioamide** (PYMAN), T., 882.
- 5-Glyoxalina-4, or 5-acrylic acid and its salts** (BARGER and EWING), T., 2339; P., 305.
- Glyoxaline-4-carboxylic acid, 5-nitro-** (WINDAUS and OPITZ), A., i, 753.
- 4, or 5-Glyoxaline-ethyl methyl ketone and its picrate** (PYMAN), T., 2176; P., 275.
- 4, or 5-Glyoxalinemethylacetosuccinic acid, ethyl ester and its salts** (PYMAN), T., 1392.
- 4, or 5-Glyoxalinemethylchloromalonamide hydrochloride** (PYMAN), T., 1401.
- 4, or 5-Glyoxalinemethylchloromalonamic acid, ethyl ester and its salts** (PYMAN), T., 1393; P., 92.
- 4, or 5-Glyoxalinemethylmalonic acid, and its ethyl ester and salts of the latter** (PYMAN), T., 1390.
- 4, or 5-Glyoxalinemethylmethylacetosuccinic acid, ethyl ester and its salts** (PYMAN), T., 1392.
- 5-Glyoxalina 4, or 5-propionibetaine and its salts** (BARGER and EWING), T., 2340; P., 305.
- 5-Glyoxalina 4, or 5-propionibetaine, a-chloro-, and a-hydroxy-** (PYMAN), T., 1394, 1400; P., 92.
- ant-Glyoxima, dichloro-, and its dibenzoyl derivative, iodo-, and di-iodo-** (STEINKOFF and JERGENS), A., i, 531.
- Glyoximes, compounds of cobalt and nickel with** (TCHUGAIEFF), A., i, 261.
substituted, anomalous molecular refraction of (TCHUGAIEFF and KOCH), A., ii, 829.
- Glyoxylic acid, brucine salt** (HILDITCH), T., 231.
- Gnoscopine (dl-narcotine), synthesis and resolution of, and its salts and bromo-, chloro-, iodo-, and their salts** (PERKIN and ROBINSON), T., 775; P., 101.
- Gold, absorption spectrum of** (DUFFIELD), A., ii, 359.
solution of, in aqua regia (PRIZONNIK), A., ii, 484.
brown (HANRIOT), A., ii, 118, 208, 258, 372; (HANRIOT and RAOULT), A., ii, 791.
colloidal (GUTHRIE), A., ii, 1098.
- Gold alloys with copper and silver** (JANECKE), A., ii, 1089.

- Gold alloys with palladium, occlusion of hydrogen by** (BERRY, T., 463; P., 56).
- with sodium (MATHEWSON, A., ii, 732).
- with tellurium (COETZ, A., ii, 405).
- Gold tellurides** (PELLINI and QUEZIGH, A., ii, 45).
- and silver telluride, new (GASTALDI, A., ii, 901).
- Auric hydroxide, formation of, on a gold anode** (MIXER, A., ii, 618).
- Gold, estimation of, quantitatively with ether** (MYLIUS, A., ii, 444).
- estimation of, in copper ores (LOEUV, A., ii, 333).
- Goldschmidtite, composition of** (GASTALDI, A., ii, 901).
- Gorgonic acid, iodo-**. See Tyrosine, *diiodo-*.
- Gent, uric acid excretion in** (MALLORY, A., ii, 219).
- Grapes, white, colouring matters of** (DEZANI, A., ii, 223).
- Graphite, theory of the formation of** (HEINRICH; HEYN, A., ii, 391).
- formation of, in iron alloys (JERICOMIN, A., ii, 239).
- alleged solution of, by decacyclene (PADOA, A., i, 382).
- analysis of (MAYER, A., ii, 1029).
- Greens, arsenical, estimation of arsenic in** (HEIDUSCHKA and REUSS, A., ii, 438).
- Grignard reagents, application of** (DAVIES and KIPPING), T., 296; P., 39.
- action of, on dihalogen compounds (v. BRAUN and SOBECKI), A., i, 701.
- Guaiacol, diethylaminoethyl carbonate hydrobromide of** (EINHORN and ROTHLAUF, A., i, 704).
- Guaiacol, 4- and 5-amino-, and their acetyl and benzoyl derivatives, and 4- and 5-chloro-, and their salts** (JONA and Pozzi), A., i, 854.
- Guaiacol ethyl ether, 5-chloro-** (JONA and Pozzi), A., i, 854.
- Guaiaconic acid, action of colloidal metals and hæmoglobin derivatives on** (BUCKMASTER, A., i, 390).
- Guanidine, acyl derivatives of** (TRAUBE), A., i, 115.
- amino-, diazo-compounds of (HOFMANN, HOCK, and KIRMREUTHER), A., i, 359.
- cyano-, action of amidines on (OSTROGOVICH), A., i, 332.
- action of nitriles on (OSTROGOVICH), A., i, 507.
- Guanidines, methylated** (SCHENCK), A., i, 842.
- 2-Guanidinovaleric acid and its salts** (ACKERMANN, ENGLAND, and KIRSCHNER), A., i, 956.
- Guanido-butylaminoguanatine** (ENGLAND and KIRSCHNER), A., i, 220.
- Guanine pentoside from** (ANDRIJK, A., i, 397).
- detection of, in tissues (DE GUY), A., ii, 132.
- Guanosine, identity of** (SCHULZE and TRIER), A., i, 155.
- Guanyldiasoguanyltetrasen, and its derivatives** (HOFMANN, HOCK, and KIRMREUTHER), A., i, 359.
- Guanyltetrasyltetrasen, preparation of, and its periodide** (HOFMANN, HOCK), A., i, 1047.
- Guayule, constituents of** (ALEXANDER), A., i, 897.
- Guignet's green, constitution of** (WAGNER and BECKER), A., ii, 401.
- Gum, estimation of, in syrups** (RICHARD and SELLIER), A., ii, 775.
- Gums, reaction of, with sodium hydride** (SOLLMANN), A., ii, 547.
- Gum kino, reactions of** (SIMONSEN), T., 1530; P., 194.
- Gun-cotton, estimation of nitrate in** (PELLET), A., ii, 930.
- Gypsum, action of, on nitrates** (DEZANI), A., ii, 1019.
- Gyrlone, and chloro-, and their derivatives** (GABRIEL), A., i, 229.
- Gyrolone** (GABRIEL), A., i, 229.

H

- Hæmatin, properties of** (SALKOWSKY), A., ii, 626.
- use of, in qualitative analysis and in the volumetric estimation of hæmatin (VASSALLO), A., ii, 1139.
- Hæmatoporphyrin, occurrence of, in the meconium** (BORRIEN), A., i, 133.
- sensitising action of (HAPPEL), A., ii, 138.
- Hæmin dimethyl ether, preparation of** (KÜSTER), A., i, 95.
- Hæmochromogen, production of** (MICHEL), A., i, 822.
- pyridine compound of (KALININ and ZEYNER), A., i, 95.
- Hæmoglobin, peroxidase character of** (BERTRAND and ROGOSINSKI), A., i, 248.
- relation of nroblin to (SIMONSEN), A., ii, 309.

- Emmoglobins**, regeneration of, after hemorrhage (BOTCHOTT), A., ii, 1108.
 derivatives, spectroscopy of (MICHEL), A., i, 821.
 action of, on guaiacum acid (BUCKMASTER), A., i, 200.
 relation of, to inorganic catalysts (MADHUSUN), A., i, 411.
 detection of, in urine (McDERMOTT), A., ii, 674.
Emmolyases, production of (SCHIFFER), A., ii, 906; (ATKIN), A., ii, 997.
 and immunity (BROWNING and WILSON), A., ii, 997.
Emmolytic by acetic acid and by ammonia (STADLER and KLEMAN), A., ii, 998.
 by alkalis (GROSS), A., ii, 50.
 produced by cocaine (FRIEDMAN), A., ii, 125.
Emmophilias, pathogenesis of hereditary (ADDIS), A., ii, 632.
Ellipsoids, composition of (THUGUTT), A., ii, 210; (STREMMER), A., ii, 408.
 colour reactions of (THUGUTT), A., ii, 501.
Electrochromy, theory of (PFEIFFER, FRIEDMAN, GOLDBERG, PROS, and SCHWABEROFF), A., i, 768.
Elementary, magneto-chemical researches on the atomic structure of the (FARFALL), A., ii, 367.
 reactivity of, in organic compounds (SENTER), T., 95; (SENTER and PORTER), T., 1049; P., 119.
 absorption of, by dry slaked lime (WILKE), P., 308.
 combination of, with finely divided silver (KASTLE), A., ii, 481.
 estimation of (SANCHEZ), A., ii, 434.
 estimation of, in benzene derivatives (MARTY), A., ii, 66.
 estimation of, in lipoids (CAITENBERG), A., ii, 927.
 estimation of, in organic compounds (WALKER and MACKAY), A., ii, 434; (ENDER), A., ii, 532; (WARUNIS), A., ii, 927.
 estimation and separation of the (DETOUT and V. WEISER), A., ii, 1130.
Enzyme acids, compounds of, with enzyme derivatives containing oxygen (MAASS and McINTOSH), A., i, 289.
Enzyme compounds, reactivity of, towards metals (STAUDINGER, CLAR, and CHAKO), A., i, 624.
Enzyme salts, estimation of (ROSENBAUM), A., ii, 668.
 C. ii.
Heart, influence of ions on the action of the (MINES), A., ii, 120.
 heat, temperature coefficient of the rate of the (ROGERS), A., ii, 503.
 antagonism of cholesterol to the action of glucosides on the (KARAULOW), A., ii, 517.
 action of barium salts on the (ROTHBERGER and WINTERBERG; WERSCHEMIN), A., ii, 1117.
 action of calcium salts on the (ROTHBERGER and WINTERBERG), A., ii, 1117.
 action of morphine on the (VAN EGMOND), A., ii, 755.
 comparative action of atropine and digitoxin on the (ROBOLICO), A., ii, 515.
 frog's, action of tervalent ions on the (MINES), A., ii, 633.
 isolated frog's, action of acetylcholine on the (HARTUNG), A., ii, 1016.
 man's and dog's, composition of the (LEDERER and STOLTE), A., ii, 906.
Heat. See under Thermochemistry.
Helianthus annuus (sunflower), constituents of (BRUCHMANN), A., ii, 324.
Helium, production of, by ionium (BOLTWOOD), A., ii, 359.
 production of, by radium (BOLTWOOD and RITCHEYFORD), A., ii, 953.
 composition of minerals containing (LANGK), A., ii, 499.
 presence of, in autunites (PIUTTI), A., ii, 565.
 absorption of, by salts and minerals (PIUTTI), A., ii, 88.
 liquid (ONNES), A., ii, 487, 675, 687.
 experiments with (ONNES), A., ii, 853.
Hemibilirubin (FISCHER), A., i, 803.
 and its oxidation products (FISCHER and MEYER), A., i, 1005.
Hemipin-1 and **-2-anilic acids**, 6-nitro-, methyl esters (WESCHER and KLEMMENC), A., i, 541.
Hemipinolic acid, derivative of (WESCHER and KLEMMENC), A., i, 541.
Hemibane, extract of (DANCOWORTH), A., ii, 644.
Hen's eggs. See Eggs.
Heptadecanitrile (*capryl cyanide*) (V. BRAUN and SOBECKI), A., i, 598.
Heptadecyl- α - and β -naphthylamines and their salts and derivatives (LESCHER), T., 828; P., 104.
Heptaldehyde brucine sulphite (MAYER), A., i, 223.
3,3',4,4',5,5',6'-Heptamethoxytriphenylmethane, 4-hydroxy- (SEITZ), A., i, 634.

- Heptan-3-one-7-tricarboxylic acid, diethyl ester, semicarbazide of** (STAUDINGER, BERKEA, and MODERLWINK), A., i, 304.
- Heptic acid, oxidation of, by permanganate** (FRSCHVALSKY), A., i, 947.
- Heptylbensene, α -bromo-, α -chloro-, and α -iodo-** (V. BRAUN, DEUTSCH, and KROBER), A., i, 909.
- Herderite, crystals of, from Auburn, Maine** (FORD), A., ii, 1102.
- Heterocyclic compounds, kinetics of the transformation of chloro-alkylamines into** (FREUNDLICH and KRESTOVNIKOFF), A., ii, 266.
- Hetero-poly-acids** (ROSENHEIM and WEINHEBER), A., i, 109; (ROSENHEIM and PINKAS), A., i, 285; (ROSENHEIM and KOHN), A., ii, 116; (ROSENHEIM), A., ii, 612.
- Hexadecadiene** (REFORMATSKY, GRISCHKWITSCH - TROCHIMOWSKY, and SEMENZOFF), A., i, 597.
- Δ^{12} -cycloHexadiene and its tribromide** (ZELINSKY and GORSKY), A., i, 847.
- Hexahydroacetanilide. See cycloHexane, acetyl derivative.**
- Hexahydroacetophenone. See cycloHexyl methyl ketone.**
- Hexahydrobenzoylacetone and its copper and sodium derivatives** (GODCHOT), A., i, 184.
1. **Hexahydrobenzoyl-2-pentanone and its derivatives** (WALLACH and OST), A., i, 474.
2. **Hexahydrobenzoyl- α -valeric acid and its derivatives** (WALLACH and OST), A., i, 478.
- Hexahydrobenzylamine, preparation of** (SABATIER and MAILHE), A., i, 627.
- Hexahydrobenzylaniline, α -hydroxy-** (BORSCHE and SCHMIDT), A., i, 59.
- Hexahydrohippuric acid and its derivatives** (GODCHOT), A., i, 369.
- 2:4:5:2':4':5'-Hexamethoxytriphenylmethane** (SZÉKI), A., i, 634.
- 2':4':5':2''':4''':5'''-Hexamethoxytriphenylmethane, 3- and 4-nitro-, 2- and 4-hydroxy-, and 3:4-dihydroxy-** (SZÉKI), A., i, 634.
- Hexamethylammonium iodide** (V. BRAUN), A., i, 612.
- Hexamethylbutylene- α - δ -diammonium hydroxide and iodide** (FARBENFABRIKEN VORM. F. BAYER & Co.), A., i, 609.
- 2:3:5:6:8-Hexamethyl-3:6-dihydropyrazine and its salts** (GABRIEL), A., i, 213.
- Hexamethylenetetramine, compound of, with metallic salts** (BARBIERI and CALSOLARI), A., i, 184, 264, 265; (BARBIERI and LANZONI), A., i, 262.
- persulphates, metallic** (BARBIERI and CALSOLARI), A., ii, 889.
- estimation of in urine** (SCHROEDER), A., ii, 343.
- Hexamethylenetetraminediguanol** (HOFFMANN-LA ROCHE & Co.), A., i, 127.
- Hexamethylthylendiammonium iodide and platinichloride** (SKRAUP and PHILIPPI), A., ii, 587.
- Hexamethylphleroglucinol, compound of, with magnesium methyl iodide** (HERZIG and ERTHAL), A., i, 77.
- Hexamethylpiperazine and its salts and dinitroso-** (GABRIEL), A., i, 213.
- Hexane, catalytic decomposition of** (PATIEFF and DOWGIEWITSCH), A., i, 937.
- preparation of halogen derivatives of α -tribromo-** (V. BEAUN and SOBIECKI), A., i, 413.
- Hexane, 1- β -iodo-** (PICKARD and KAYTON), T., 65.
- cycloHexane, catalytic decomposition and isomerisation of** (PATIEFF and DOWGIEWITSCH), A., i, 937.
- bromination of** (BODROUX and TABOURY), A., i, 622.
- acetyl derivative (hexahydrobenzoyl-ide)** (GODCHOT), A., i, 131.
- cycloHexane-1-carboxylic acid, 1- α -amethyl ester** (ZELINSKY, ANSENOFF, and KULIKOFF), A., i, 773.
- cycloHexane-1:1-diacetic acid and its imide, anhydride, and other derivatives** (THOLE and THORPE), T., 440.
- cycloHexane-1:1-diacetic acid, α - δ -cyano-, derivatives of** (GUARESCHI), A., i, 792.
- cycloHexane-1:1-dimalonic acid, α - δ -di-imino-di-imide, and diimide and their derivatives** (THOLE and THORPE), T., 444, 417.
- α - δ -Hexanesuccinimide, α - δ -ketone** (GUARESCHI), A., i, 793.
- cycloHexanol, action of, with bromine and aluminium bromide** (BODROUX and TABOURY), A., i, 779.
- cycloHexanone, action of bromine and aluminium bromide on** (BODROUX and TABOURY), A., i, 779.
- action of hydrazine hydrate** (KIJNER and BLOFF), A., i, 61.
- azine and nitrophenylhydrazones** (CIUSA), A., i, 931.
- cycloHexanones, halogenides of** (K and STEINHORST), A., i, 216.

- iso-Homo-o-homoguinone.** See 2:3-Toluquinone.
- Homocoumarone.** See Dimethylcoumarone.
- Homocollidine, physiological action of** (BERLINI, A., ii, 516).
- γ -Homocollidine.** See Trimethylpropylammonium, hydroxy-, chloride.
- Homochromoisomerism** (HANTZSCH), A., i, 715.
- Homogentiale acid and its derivatives** (MÖRNER), A., i, 55.
- Homophthalic anhydride, action of, magnesium organic compounds on** (BAUER and WÖLZ), A., i, 871.
- Homocollidic acid, hydroxy-.** See Toluic acid, dihydroxy-.
- Homoterpene, $C_{12}H_{20}$ from homocoumarone** (RICHARD), A., i, 733.
- Homoveratroyhomopiperonylamine** (PICTET and GAMS), A., i, 807.
- Honey, chemistry of formation of** (KÜSTEN-MACHER), A., ii, 127.
- biological investigation of (MOREAU), A., ii, 326.
- estimation of manganese in (GOTTFRIED), A., ii, 824.
- identification and estimation of proteins in (MOREAU), A., ii, 317.
- Hops, oil of, constituents of** (SEMMLER and MAYER), A., i, 733.
- humulene from (DEUSSEN), A., i, 549.
- Hordeanine, formation of, during the germination of barley** (TORQUATE), A., ii, 523.
- methochloride (FARBENFABRIKEN VORM. F. BAYER & Co.), A., i, 629.
- Hormones, function of, in regulating metabolism** (ARMSTRONG and ARMSTRONG), A., ii, 642.
- Hewlite from California** (EAKLE), A., ii, 901.
- Humic acid, oxidation of** (DOJARENKO), A., i, 357.
- Humic, reaction of, with potassium hypobromite** (KONSCHOU), A., i, 18.
- Humulene, from oil of hop flowers** (DEUSSEN), A., i, 549.
- Hydantoin, 2-thio-** (WHEELER, NICOLET, and JOHNSON), A., i, 1031.
- Hydantoin** (WHEELER and HOFFMAN), A., i, 1028; (WHEELER and BRAUTLECHT), A., i, 500; (JOHNSON and BRAUTLECHT), A., i, 813; (BRAUTLECHT), A., i, 922; (WHEELER, HOFFMAN, and JOHNSON), A., i, 923; (WHEELER, NICOLET, and JOHNSON), A., i, 1031.
- Hydrocarbons, fats from** (LENDRICH, KOCH, and SCHWARTZ), A., ii, 1125.
- Hydrastine, constitution of** (BALE and McMILLAN), A., i, 77.
- Hydrastine, action of organic-sodium compounds on** (FRANZEN and LEDERER), A., i, 906.
- salts, preparation of (DELAZAR), A., i, 906.
- Hydrates, rôle of water in the formation of** (FETTER), A., ii, 1056.
- determination of the vapour pressure of (PARTINGTON), P., 12; (FRANZEN and SCHOLKE), A., ii, 859.
- Hydration values, determination of** (WORLEY), T., 349; (GLOVER), T., 371.
- Hydrazides, decomposition of, by heat** (CHATTAWAY, CUMMING, and WEDDON), T., 1950; P., 193.
- Hydrazidines, substituted, action of nitrous acid on** (PONZIO and GASTARDI), A., i, 925.
- Hydrazine, anhydrous, preparation of** (HALE and SHETTERLEY), A., i, 718.
- oxidation of (HALE and NUNZ), A., i, 845; (HALE and REDFERN), A., ii, 929.
- action of, on aldehydes and ketones (STAUDINGER and KUPFER), A., i, 751.
- influence of, on the blood sugar content (UNDERHILL), A., ii, 919.
- compounds of, with metallic salts (FRANZEN and LUTTING), A., i, 285.
- action of sulphur acid and its compounds on (EPHRAIM and PROTHMAN), A., ii, 275.
- salts, behaviour of, with liquid ammonia (BROWNE and WELSH), A., ii, 1084; (BROWNE and HORTON), A., ii, 1085.
- hydrate, action of, on ethyl succinate (CURTIUS and GOREL), A., i, 401.
- action of, on ethyl chloracetate (CURTIUS and HIRSONG), A., i, 400.
- action of, on α -diketones (CRINA and KASTNER), A., i, 324.
- action of, on cyclohexanone (KOPPE and BELOFF), A., i, 678.
- action of mercuric oxide on (HALE and NUNZ), A., i, 813.
- action of metallic sodium on (SODOLA), A., ii, 279.
- action of, on sodamide (SMALL), A., ii, 201.
- precipitation of iron with (SMALL), A., ii, 937.
- sulphate, action of, on nitric acid (FRANZEN and SHEN), A., ii, 822.

- hydrazine, auto-oxidation of (CHATTAWAY and ALPINDER), T., 404.
- oxidation and auto-oxidation of (CHATTAWAY), A., i, 404.
- aromatic (WIELAND and WICKER), A., i, 52; (WIELAND), A., i, 509; (WIELAND and SCHNEIDER), A., i, 570.
- hydroxy, preparation of derivatives of (WIELAND and FRENDEL), A., i, 404.
- pyrazinocarboxylic acid, methyl ester and its derivatives (DIEHL and FRITSCHE), A., i, 957.
- pyrazinodicarboxylic acid, methyl ester (DIEHL and FRITSCHE), A., i, 958.
- pyrazinodisulphonic acid, barium and hydrazine salts of (EPHRAIM and PIOTROWSKI), A., ii, 275.
- pyrazinodisulphonamide (EPHRAIM and LASOCKI), A., ii, 276.
- pyrazinodisulphonic acid (EPHRAIM and LASOCKI), A., ii, 276.
- pyrazinodisulphohydrazide hydrochloride (CURTIS and HIRASONO), A., i, 400.
- pyrazinodisulphonic acid (CURTIS and HIRASONO), A., i, 401.
- para-*p*-toll (p-toluyol-p-tolylhydrazine) (CURTIS and KASTNER), A., i, 355.
- pyrazinone, action of, with mixed aldehydes (RANSOW and BURMEISTER), A., i, 820.
- pyrazinone, 2:4:6:4'-tetranitro-, potassium salt of (CIUSA), A., i, 921.
- 4'-nitronitroso- (GILLES and BEARDNER), T., 1968; P., 229.
- pyrazine compounds (RANSOW and BURMEISTER), A., i, 820; (RANSOW and BECKER), A., i, 821; (RANSOW and BECKER), A., i, 932.

- action of cotarnine on** (KNOLL & Co.), A., i, 670.
- Imidodisulphinic acid**, ammonium and silver salts of (EPHRAIM and PROTEOWSKY), A., ii, 274.
- Iminasoles**, complex (MELDOLA and KUNTER), T., 36.

- Iminasoles**. See also Glyoxalimines.
- Imino-acids**, synthesis of pyruvic compounds from (JOHNSON and BRANCH), A., i, 544.
- Imino-compounds**, formation and reactions of (THOLE and THORPE), T., 422, 1884; P., 42, 219.
- Iminodiacetic acid**, and its metallic salts (SIEGFRIED), A., i, 427.
- β -Iminodibutyric acid**, methyl ester (FISCHER and SCHWILKE), A., i, 427.
- Iminodiacarboxylic acid**, cyano-, methyl ester, and ethyl ester, ammonium salt (DIRLS and GOLLMANN), A., i, 954.
- Iminosulphides** (MATSUI), A., i, 201.
- Immune substances**, origin of, (McGOWAN), A., ii, 309.
- passage of, into lymph, and the influence of the spleen on their formation** (LUCKHARDT and BECHT), A., ii, 217, 312.
- Immunity and hemolysins** (BROWNING and WILSON), A., ii, 997.
- Immeration**, apparatus for (ARN), A., ii, 149.
- Indanthren**, oxidation of (SCHOLL and EDLACHER), A., i, 756.
- dichloro-** (FARBENFABRIK AG F. BAYER & Co.), A., i, 504.
- Indazoles**, hydroxy- (FREUNDLER), A., i, 577, 753, 757, 815.
- c-Indarylbenzoic acid**, and 3-hydroxy-hydrochloride (BAMBERGER), A., i, 694.
- Indene-1-carboxylic acid** (GRIGNARD and COURTOT), A., i, 193.
- and its esters** (WEISSGEBER, VOGEL, DOMBROWSKY, and KRAFT), A., i, 623.
- Indene series** (WEISSGEBER), A., i, 621.
- 1-Indenol** (GRIGNARD and COURTOT), A., i, 193.
- Indenyl magnesium bromide** (GRIGNARD and COURTOT), A., i, 193.
- 1-Indenylidiphenylcarbinol** (GRIGNARD and COURTOT), A., i, 193.
- tert.-1-Indenylfluorene** (GRIGNARD and COURTOT), A., i, 193.
- and its methyl ether** (GRIGNARD and COURTOT), A., i, 533.
- Indican**, estimation of, in urine by a spectro-colorimetric method (KROGOWSKI), A., ii, 553.
- estimation of, in the presence of iodides** (REICHARDT), A., ii, 534.
- Indicators**, behaviour of naphthalene phosphates with (STARKENSTEIN), A., ii, 537.
- of the methyl-red type** (HOWARD and POPE), T., 1333; P., 206.
- Indigo dyeing**, theory of (BINI and MANDOWSKY), A., i, 497.

- Indigotin**, preparation of, from indole (GESELLSCHAFT FÜR TEERVERWERTUNG), A., i, 497.
 preparation of, in the laboratory, and as a lecture experiment (MICHEL), A., ii, 715.
 preparation of halogen derivatives of (BADISCHE ANILIN- & SODA-FABRIK), A., i, 925.
 condensation, negative case of (PISOVCHNI), A., i, 577.
 estimation of, in the presence of starch (THOMSON), A., ii, 846.
Indigotin, dichlorodibromo-, and **pentachloro-** (BADISCHE ANILIN- & SODA-FABRIK), A., i, 1031.
Indigo-yellow, preparation of (WUTH), A., i, 631.
Indirubin, constitution of (MAILLARD), A., i, 229; (WAHL and BAGARD), A., i, 577.
 and bromo- (WAHL and BAGARD), A., i, 164.
Indirubin-p-dimethylamino-3-anil and its sulphate (PUMMERER and GOTTIER), A., i, 252.
Indium, crystallographic relations of, and thallium (WALLACE), A., ii, 890.
Indole, formation of, by *Typhaceae* (TELLE and HUBER), A., ii, 317.
 formation of indigotin from (GESELLSCHAFT FÜR TEERVERWERTUNG), A., i, 497.
 preparation of alkyl derivatives of (ODDO), A., i, 486.
 behaviour of, in the organism (KAUFFMANN), A., ii, 420.
 behaviour of, in rabbits (BLUMENTHAL and JACOB), A., ii, 58.
 and its derivatives, and its separation from coal tar (WEISSGERBER), A., i, 155.
 detection of (TELLE and HUBER), A., ii, 317.
 estimation of (SKIDELIN), A., ii, 553.
Indole-3-iodo-, preparation of (OSWALD), A., i, 747.
Indole group, syntheses in the (ODDO: ODDO and SEMA), A., i, 486.
Indole-1-carboxylic acid (ODDO and SEMA), A., i, 487.
Indole-2-carboxylic acid, ethyl ester (ODDO and SEMA), A., i, 488.
Indolelactic acid (EHRICH and JACOBSEN), A., ii, 621.
3-Indoleacethrone, preparation and properties of (SCHOLL and v. WOLOD-KOWITSCHE), A., i, 883.
Indophenol, preparation of halogen-substituted derivatives of (CASSELLA & Co.), A., i, 1025.
Indoxyl, action of carbonyl chloride on (GESELLSCHAFT FÜR CHEMISCHE INDUSTRIE IN BASEL), A., i, 675.
Indoxylacanthrene (LIEBERMANN and ZAUFFA), A., i, 387.
Indoxyl-3-aldehyde, derivatives of (FRIEDLÄNDER and KIELBASO), A., i, 1022.
Indoxylcarboxylic acid, 7-chloro-3-bromo-, and 5:7-dichloro-, esters and salts of (BADISCHE ANILIN- & SODA-FABRIK), A., i, 156.
3-Indyl-3-indolidenmethane perchlorate (KÖNIG), A., i, 810.
Inorganic compounds, isomerism of (VOGE), A., ii, 977.
 causes of the formation of colour in (REICHARD), A., ii, 561.
 thermoelectric properties and thermal conductivity of various (KÖNIGSBERGER and WEISS), A., ii, 578.
Inosic acid (LEVENT and JACOB), A., i, 408.
Inositol, detection of (SALKOWSKI), A., ii, 73.
Inositolphosphoric acid, preparation of pure, and its physiological importance (STARKENSTRIN), A., ii, 132.
Insanity, esterase and nuclease content of serum in (PIORINI), A., ii, 632.
Insecticides from coal-tar, action of, on green plants (MIRANDE), A., ii, 223.
Insects, fluorescent substance from (McDERMOTT), A., i, 396.
Insoluble residues, treatment of (EBLER), A., ii, 832.
Intestinal putrefaction, effect of copious water drinking on (HATTEM and HAWK), A., ii, 213.
Intestinal juices, enzymes of (LONDON and KRYM: AMANTEA), A., ii, 1000.
 action of, on the digestive products of proteins (LONDON: LONDON and SOLOWKOFF), A., ii, 1000.
Intestine, chemistry of the contents of the (BOEHM), A., ii, 749.
 free amino-acids in the (ABDERHALDEN), A., ii, 1011.
 action of sulphur in the (FRANKL), A., ii, 749.
 small resected, metabolism with (UNGERHILL), A., ii, 214.
Intramolecular transformations (BUSEN and LIMPACH), A., i, 384; (DINROTH and SCHNEIDER), A., ii, 31.
Inulin, micro-detection of (TUNMANN), A., ii, 159.
Inulinase from *Aspergillus niger* (BOSELLI), A., ii, 1022.
Invertase, composition of (MATHY and GLENN), A., i, 409.

- Invertase**, pure, preparation of (EULER and KULLBERG), A., i, 825; (HERZOG), A., i, 1062.
 decomposition of (EULER and KULLBERG), A., i, 409.
 influence of acids on (STOWARD), A., i, 1052.
 action of hydrogen ions on (MICHAELIS and DAVIDSON), A., i, 1062.
 action of, on polysaccharides derived from levulose (BOURQUELOT and BRIDEL), A., i, 512.
 inhibition of the action of (ERIKSSON), A., i, 698.
- Invertebrates**, proteolytic enzymes of (SELLNER), A., ii, 1113.
- Invert-sugar**, behaviour of, in alkaline solution with hydrogen peroxide (JOLLES), A., i, 951.
- Iodic acid**. See under Iodine.
- Iodine**, atomic weight of (BAXTER), A., ii, 112.
 resonance spectra of (WOOD), A., ii, 82.
 resonance spectra of the vapour of (WOOD), A., ii, 950.
 influence of helium on the spectrum of fluorescent (WOOD and FRANK), A., ii, 170.
 magneto-optical effects of (HEURUNG), A., ii, 963.
 absorption of, by charcoal (CORRIDI), A., ii, 1083.
 solutions, colour of (LEY and ENGELHARDT), A., ii, 951.
 vapour, dissociation of (STARCK and BODENSTEIN), A., ii, 20.
 action of light on (OWEN and PRALING), A., ii, 353.
 destruction of the fluorescence of, by gases (WOON: FRANK and WOOD), A., ii, 169.
 hydrolysis of (BRAY and CONNOLLY), A., ii, 864.
 solubility equilibrium between, and organic substances (OLIVARI), A., ii, 592.
 dissolved, velocity of solution of metals in (VAN NAME and BOSWORTH), A., ii, 978.
 oxidation of, by hydrogen peroxide (AUGER), A., ii, 386.
 liberation of, and bromine, from aqueous solutions (LABAT), A., ii, 653.
 formation of derivatives of resorcinol and tannin (GERARD), A., i, 289.
 reactivity of ketones towards (DAWSON and ARK), T., 1740; P., 223.
 action of, on phenols and its application to their volumetric estimation (WILKIE), A., ii, 546.
- Iodine**, accumulation of, in *Thalassidroma* (TAKEMURA), A., ii, 600.
- Iodides**, estimation of (REINHART), A., ii, 554.
 estimation of, in small quantities (BERNIER and PÉRON), A., ii, 435.
- Hypoiodites**, formation of, during iodine titrations (BATEY), A., ii, 436.
- Hypoiodite reaction**, influence of electrolytes on the velocity of the (SKRAAL), A., ii, 382.
- Iodic acid**, velocity of the reaction between sulphurous acid and (PATTERSON and FORSYTH), P., 320.
 estimation of, in alcoholic solutions (FAYREL), A., ii, 150.
 estimation of, in animal fluids (BERNIER and PÉRON), A., ii, 926.
 estimation of, in the thyroid (SHILL), A., ii, 926.
- Iodo-acids**, fatty, behaviour of, in the organism (PONZIO), A., ii, 1015.
- Iodo-compounds**, organic, preparation of, from the corresponding chloro and bromo-compounds (KNOLL and CO.), A., i, 432.
- Iodoform**, dimorphism of (BARBER), A., i, 101.
 oxidation of (PLOTRNIKOFF), A., ii, 4, 452.
 influence of, on phagocytosis (HAYBURGER, DE HAAN, and PAVLOVIĆ), A., ii, 504.
- Ionidine** and its salts (BRINDLEY), A., i, 222.
- Ionisation**. See under Electrochemistry.
- Ionium**, period of (SODDY), A., ii, 561 (PIUTTI), A., ii, 565.
 production of helium by (BOLTWOOD), A., ii, 359.
 separation of, from residues (BOLTWOOD), A., ii, 359.
- Ions**. See under Electrochemistry.
- Ipecacuanha alkaloids** (KELLEE), A., i, 1014.
- Ipomoea orizabensis***, constituents of the root of (POWER and ROGERSON), P., 304.
- Iridium**, electrical properties of (BESSEWSKI and HACKSPILL), A., ii, 1055.
 complex chlorides of (DELEPINE), A., ii, 806.
- Iridotetrachloro-oxalic acid** and its metallic salts (DUFFOUR), A., i, 519.
- Irido-oxalic acid**, properties of, and its metallic salts (DUFFOUR), A., i, 519.

- Iron vermicular*, formation of the rhizome of (POWER and SALWAY), A., ii, 143.
- Iron, atomic weight of (BAXTER, THORVALDSEN, and COBE), A., ii, 237; (BAXTER and THORVALDSEN), A., ii, 238.
- arc spectrum of (KAYSER), A., ii, 166.
- anode. See Anode under Electrochemistry.
- compounds of, in the potash-salt deposits (BOKKE), A., ii, 293.
- passivity of (DUNSTAN and HILL), T., 1853; P., 222.
- passivity of, influence of the magnetic field on the (BYKES and MORGAN), A., ii, 1057.
- porosity of, and its relation to passivity and corrosion (FRIEND), P., 311.
- solubility of carbon in (RUFF and GÖCKE; RUFF), A., ii, 897.
- cementation of, by solid carbon (CHAPRY and BONNETOT), A., ii, 1091.
- solubility of hydrogen in (SIEVERTS), A., ii, 895.
- rusting of (DUNSTAN and HILL), T., 1835; P., 221; (ANDSTRÖM), A., ii, 43; (FRIEND), A., ii, 401, 805; (JACOB and KARABOHRER: ARNDT: DONATH), A., ii, 896.
- cause of the de-rusting of, in ferro-concrete (ROHLAND), A., ii, 1093.
- influence of impurities on the corrosion of (COBE), A., ii, 1092.
- action of water containing carbon dioxide on (CLOUS), A., ii, 206.
- action of steam on, at high temperatures (FRIEND, HULL, and BROWN), T., 969; P., 124.
- action of salt solutions and of seawater on (FRIEND and BROWN), T., 1302; P., 156.
- catalytic synthesis of ammonia by means of (JELLINKER), A., ii, 798.
- valency of, in blood-pigment (KÜSTER), A., i, 409.
- galvanised, structure of (GUENTHER), A., ii, 898.
- metabolism. See Metabolism.
- Iron alloys, formation of graphite in (JEROMIN), A., ii, 289.
- with antimony (PORTEVIN), A., ii, 898.
- with carbon (RUEY and ILWIN), A., ii, 494.
- with carbon, precipitation of carbon from (HATFIELD), A., ii, 401.
- estimation of carbon in (STADELER), A., ii, 538.
- Iron alloys with carbon and chromium (ARNOLD and READ), A., ii, 1092.
- with chromium, resistance of, to acids (MONNARTZ), A., ii, 610.
- with copper, corrosion of, by sea water (JØRISSEN), A., ii, 41.
- with molybdenum and vanadium, estimation of silicon in (TRAUTMANN), A., ii, 538.
- with silicon and carbon (GONTERMANN), A., ii, 1091.
- with titanium, analysis of, rich in silicon (TRAUTMANN), A., ii, 861.
- Iron group, magnetisability of salts of metals of the (WEBER), A., ii, 1057.
- Iron salts, catalytic action of (COLIN and SÉNÉCHAL: WOLFF and DE STOBELIN), A., ii, 795.
- estimation of, in mineral waters (AGENO and GUICCIARDINI), A., ii, 769.
- Iron arsenide, preparation of (HILPERT and DIECKMANN), A., ii, 985.
- boride (HOFFMANN), A., ii, 116.
- carbonate, isomorphous mixtures of, with calcium and magnesium carbonates (DIESEL), A., ii, 725.
- carbonyl, formation of (STOFFEL), A., ii, 986.
- magnetic susceptibility of (OILEY), A., ii, 251.
- oxides, formation and reduction of (HILPERT and BEYER), A., ii, 729.
- sulphides, artificial production of (ALLEN), A., ii, 1093.
- Ferric salts, oxidation of phenol by (COLIN and SÉNÉCHAL), A., ii, 872.
- estimation of, volumetrically (MÜLLER and WEGELIN), A., ii, 937.
- chloride, electrical conductivity of the system, and ammonium thiocyanate (BORGIOVANNI), A., ii, 1052.
- hydroxide, colloidal (DUMANSKI), A., ii, 610.
- adsorption of arsenic by (LOCKERMANN), A., ii, 485.
- oxide, estimation of, in presence of alumina (KRISGER), A., ii, 1034.
- rapid estimation of, in cement (GOLUBINZEFF), A., ii, 938.
- separation of, and alumina (BARBIER), A., ii, 70.
- sulphate as a standard for titration of potassium permanganate (MILBAUER and QUADPAT), A., ii, 936.

Ferrous chloride, compounds of, with ammonia (GIRARDT), A., ii, 43.
nitride, formation of (GIRARDT), A., ii, 43.
new reaction for (CHARITCHOFF), A., ii, 543.
salts, oxidation of (BARKERVILLE and STEVENSON), A., ii, 729.
sulphide, formation of, in solutions (FIELD), A., ii, 289.

Iron organic compounds:—

Ferric thiocyanate, compounds of, with organic bases (BARRIKER and PAMPANINI), A., i, 225.
catalytic action of (COLIN and BENECHEAL), A., i, 530.

Ferrieryanides, detection of, in the presence of cyanides (GASTALDI), A., i, 186.

Ferrieryanides, nature of (CAMBI), A., i, 430.

Ferrieryanides, isomerism of (BRIGGS), T., 1019; P., 24.
organic, constitution of (HARTLEY), T., 1549; P., 211.
estimation of (RONNET), A., ii, 938.

Iron:—

Cast iron, crystallisation of white (BENEDICKS), A., ii, 728.
growth of, after repeated heatings (CARPENTER), A., ii, 1091.
influence of vanadium on the physical properties of (HATFIELD), A., ii, 1092.

Steel, from Greenland, constituents of (BENEDICKS), A., ii, 287.

etching of (ROBIN and GARTNER), A., ii, 495.

recovery of hammered (GUILLET), A., ii, 97.

influence of temperature on the magnetic properties of (MOIR), A., ii, 791.

development of heat in (ARNOLD), A., ii, 728.

gas contained in (CHARPY and BONNETOT), A., ii, 609.

influence of manganese on the properties of (LANG), A., ii, 206.

influence of nitrogen in the hardening of (KIRNER), A., ii, 494.

influence of 0.2 % vanadium on (McWILLIAM and BARNES), A., ii, 1092.

hyperentectoid, influence of thermal treatment on the properties and structure of (JUNG), A., ii, 898.

martensite and pearlite, structure of (ORKOFF), A., ii, 986.

pearlitic, structure of (ORKOFF), A., ii, 495.

Steel, detection of chromium in (STANKE), A., ii, 443.

estimation of carbon in (MAHLER and GOUTAL; DE NOLLY), A., ii, 937; (AUGUSTIN), A., ii, 1029.

estimation of chromium in (WILKINSON and BOGOLUBOFF), A., ii, 157.

estimation of chromium, tungsten and phosphoric acid in (HINCKELSEN and DRECHMANN), A., ii, 156.

estimation of manganese in (KATSKER), A., ii, 70.

estimation of nickel in (RAULIN), A., ii, 1034.

volumetric estimation of sulphur in (ELLIOT), A., ii, 1131.

apparatus for estimating sulphur in (WENNEMANN), A., ii, 938.

estimation of sulphur and carbon in (WENNEMANN), A., ii, 1026.

See also Chromium steel and Nickel steel.

Iron (in general), detection, estimation and separation:—

precipitation of, with hydrazine hydrate (SCHIRM), A., ii, 937.

estimation of, colorimetrically (LACHS and FRIEDENTHAL), A., ii, 542.

estimation of small quantities of, in organic compounds (JAHN), A., ii, 1133.

estimation of, volumetrically, in the presence of titanic salts (KNECHT and HIBBERT), A., ii, 544.

estimation of carbon in (AUGUSTIN), A., ii, 1029.

apparatus for estimating carbon in (BUTZBACH and FENNER), A., ii, 937.

estimation of ferrous, in silicates (DITTRICH), A., ii, 543.

estimation of phosphorus in, without separation of silicon (MÜLLER), A., ii, 1132.

containing graphite, estimation of silicon in (REICHARD), A., ii, 929.

estimation of sulphur in (ELLIOT), A., ii, 1131.

estimation of sulphur and carbon in (WENNEMANN), A., ii, 1026.

apparatus for estimation of sulphur in (WENNEMANN), A., ii, 653, 938; (JABOULAY), A., ii, 654.

analyses of the rust of (DONATH and LEDRA), A., ii, 805.

estimation of, in urine (REICH), A., ii, 1035.

estimation of, in water (SCOFFLE), A., ii, 940.

- Iron (in general), detection, estimation and separation:—
and vanadium, estimation of, volumetrically (MULLER and DIEFENBACH), A., ii, 534.
separation of, from aluminium (CHARITCHKOFF), A., ii, 542.
separation of, chromium and aluminium (TONARVIAN and WUNDER), A., ii, 156; (SCHIRM), A., ii, 936.
quantitative separation of manganese and (BANCHER), A., ii, 1138.
separation of vanadium and (DRINE and LEVANT), A., ii, 939.
Iodine, tautomerism of* (PALAZZO and SKELIN), A., i, 436.
oxidation of amino-acids by (TRAUER), A., i, 960.
phenylhydrazones of (AUWER and BORNHECK), A., i, 588.
Iodine-3-azil, desmotropism of (PUMMER and GRUBE), A., i, 231.
Iodine-3-methylanilide (PUMMER and GRUBE), A., i, 231.
Isocacetic acid, 6-chloro- (BADISCHE ANILIN- & SODA-FABRIK), A., i, 539.
Isotole anhydride, 6-chloro- (BADISCHE ANILIN- & SODA-FABRIK), A., i, 540.
Isomerism, theory of (BALY), A., ii, 451.
and polymorphism (BILMANN), A., i, 367, 963; (CIURA and VECCHIOTTI), A., i, 810; (STORBE), A., ii, 970.
of inorganic compounds (VOGE), A., ii, 977.
Isoprene, synthesis of (HARRIES), A., i, 798.
production of, by the decomposition of terpenes (HARRIES and GUTLOS), A., i, 798.
preparation of, from terpenes (STAUDINGER and KLEVER), A., i, 731.
compound of, with sulphurous acid (BADISCHE ANILIN- & SODA-FABRIK), A., i, 939.
Isoprene-cacothene, "normal" and "sodium" and their derivatives (HARRIES and NEERHEIMER), A., i, 800).
- J.
- Jamacaite, composition of (SCHALLER), A., ii, 209.
- K.
- "Kalk stickstoff," analysis of (DINSLAGE), A., ii, 1027.
See also Calcium cyanamide.
- Kaolinite, formation of, in coal-measure shales (BUTTON), A., ii, 735.
constitution of (MELLOR and HOLDCROFT), A., ii, 607.
Kaphir formation, chemistry of (GINZBERG), A., ii, 140.
Keratin of birds, sulphur and cystine in the (BUCHTALA), A., i, 97.
decomposition product of, giving Millon's reaction (GORTNER), A., i, 697.
Kermek. See *Statice gmelini*.
Ketazines, stability of the nitrogen linking in (WIELAND and ROSENF), A., i, 571.
Ketene (STAUDINGER and JELAGIN), A., i, 215; (STAUDINGER), A., i, 306, 307, 308, 650; (STAUDINGER and HEKKE), A., i, 459; (STAUDINGER and RUCICKA), A., i, 463; (STAUDINGER, CLAR, and CZAKO), A., i, 636 (STAUDINGER and CLAR), A., i, 636 (STAUDINGER and OTT), A., i, 639 (STAUDINGER and KUPFER), A., i, 641; (STAUDINGER and KON), A., i, 876.
Keto-alcohols, preparation of (DRELL and JOHNS), A., i, 254.
Keto-alcohols, secondary, synthesis of (GAUTHIER), A., i, 415.
tertiary, synthesis of (GAUTHIER), A., i, 518.
Keto- γ -acetoxyvaleric acid (WOHL and MAAG), A., i, 13.
Keto- β -benzoylaniline- $\alpha\beta$ -diphenyl-ethane (EVERETT and MCCOMBIE), T., 1748.
4(or 5)- γ -Ketobutylglyoxaline. See 4(or 5)-glyoxaline-ethyl methyl ketone.
Ketochlorides, aromatic, action of metals on (NORRIS, THOMAS, and BROWN), A., i, 31.
Keto-1:3'-coumaranecoumarone and its hydrobromide (FRIES and PFAFFENDORF), A., i, 149.
Keto-2:5-di-isobutyltetrahydrofuran (DUFONT), A., i, 805.
Keto- $\Delta^{1:2}$ -dicoumaran and its derivatives (FRIES and PFAFFENDORF), A., i, 150.
 β -Keto-3:3-diethoxy- $\alpha\beta\gamma$ -tetramethylvaleric acid, ethyl ester (SHDANOVITSCH), A., i, 10.
Keto-2:3-dimethylaminoanilicoumaran (FRIES and HANSELBACH), A., i, 151.
Keto-5:5'-dimethyl- $\Delta^{1:2}$ -dicoumaran and its derivatives (FRIES and PFAFFENDORF), A., i, 150.
Keto-2:6-dimethyl-2:6-diethyltetrahydrofuran and its semicarbazone (DUFONT), A., i, 805.

- Keto-2,3-dimethyl-2,3-dihydropyrrrole-3-carboxylic acid**, and its salts and 4-bromo-, 4-nitro-, 4-nitroso-, and 1,4-dinitroso-, and their derivatives (GARRICK), A., i, 277.
- Keto-2,3-dimethyltetrahydrofuran and its derivatives** (DUPONT), A., i, 805.
- Keto-2,3-dipentamethylenetetrahydrofuran and its semicarbazone** (DUPONT), A., i, 805.
- Keto-2,3-diphenyl-2,3-dihydrofuran-2-acetic acid** and its ethyl ester (BESCHKE, WINOGRAD-FINKEL, and KÖRNER), A., i, 874.
- Keto-2,3-diphenyl-2,3-dihydrofuran-2-iodoacetic acid** (BESCHKE, WINOGRAD-FINKEL and KÖRNER), A., i, 874.
- Keto-2,3-diphenyltetrahydrofuran-2-acetic acid**, 3-hydroxy-, and its ethyl ester (BESCHKE, WINOGRAD-FINKEL, and KÖRNER), A., i, 873.
- Keto-1:3:5-triazine** (BUSCH and HEFLE), A., i, 583.
- Keto-5-ethoxy-3-ethylhydrocinnam-phoric acid**, methyl ester (KOMPIA and HOUTALA), A., i, 382.
- Keto-6-ethylthiol-(1)-thionaphthen and its nitroso-derivative** (KALLE & Co.), A., i, 666.
- Keto-6-ethylthiol-(1)-thionaphthen-2-carboxylic acid** (KALLE & Co.), A., i, 667.
- Keto- β -formylaniline- α -8-diphenyl-ethane** (EVEREST and MCCOMBIE), T., 1750.
- Ketoglutaric acid**, ethyl ester and derivatives of (BLAISE and GAULT), A., i, 520.
- diethyl ester and phenylhydrazine of (WISLICIENUS and WALDMÜLLER), A., i, 603.
- Keto- α -8888-hexamethyladipic acid**, ethyl ester (SHANOVITSCH), A., i, 10.
- Ketols**. See Keto-alcohols.
- Keto-5-, and -6-methoxy-(1)-thionaphthens** (KALLE & Co.), A., i, 666.
- Keto-5-, and -6-methoxy-(1)-thionaphthen-2-carboxylic acids** and their nitroso-derivatives (KALLE & Co.), A., i, 666.
- Keto- α -methylglutaric acid** and its ethyl ester and their derivatives (BLAISE and GAULT), A., i, 520.
- Keto-3-methylimino-5-phenylpyrrolidine hydrochloride** and picrate (MUMM and MÜNCHMEYER), A., i, 80.
- Keto-7-methyltetrahydrohexathiazole-5-carboxylic acid**, 2-amino-, ethyl ester (JOHNSON and HILL), A., i, 502.
- Keto-5-methylthiol-(1)-thionaphthen and its nitroso-derivative** (KALLE & Co.), A., i, 667.
- Keto-6-ethylthiol-(1)-thionaphthen-2-carboxylic acid** (KALLE & Co.), A., i, 667.
- Keto- β -methylvaleronitrile** and its amide (WOHL and MAAG), A., i, 27.
- Ketone**, $C_{11}H_{16}O$, from oxidation of trihydroxyphythane, and its derivatives (WILLSTÄTTER, MEYER, and HETSCH), A., i, 148.
- $C_{11}H_{16}O$, from oxidation of 8-phytol, and its derivatives (WILLSTÄTTER, MEYER, and HETSCH), A., i, 148.
- $C_{12}H_{18}O$, from oxidation of 8-phytol, and its derivatives (WILLSTÄTTER, MEYER, and HETSCH), A., i, 147.
- $C_{12}H_{18}O$, from 4:6-dimethylconmarone and sodium ethoxide, and its derivatives (FRIES and VOLK), A., i, 295.
- Ketone** formation, relation of muscular work to (PRETTI), A., ii, 628.
- Ketones**, preparation of, from toluol and (SENDERENS), A., i, 131.
- from phenylpropionic acid (SENDERENS), A., i, 302.
- of higher fatty acids, preparation of (EASTFIELD and TAYLOR), T., 2298; P., 279.
- Compounds of, with unsaturated acids (FAREWELL FORM. MEINER, LUCIUS, and BRÜNING), A., i, 101.
- action of ethyl chlorocarbonate on sodium derivatives of (HALLER and BAUER), A., i, 299.
- action of hydrazine on (STAUDINGER and KUPFER), A., i, 751.
- action of hydroxylamine on (CHICA and TERNI), A., i, 918.
- reactivity of, towards iodine (HAWES and ARK), T., 1740; P., 223.
- catalytic reduction of (SKITA and RITTER), A., i, 71.
- action of, and codamide (HALLER and BAUER), A., i, 726.
- action of, on the sodium derivative of phenylacetone (BUDROUX), A., i, 645.
- acetylenic, combination of, with amines (ANDRÉ), A., i, 268.
- halogenated alicyclic (KOTZ and STEINHOEST), A., i, 210.
- hydroaromatic (CROSSLY and RENOUF), T., 1101; P., 137.
- synthesis of (DARZEN and ROSE), A., i, 988.
- chloro-derivatives of (ATWELL), A., i, 383.
- unsaturated, optical properties of (GETMAN), A., ii, 677.
- explanation of the reaction of, by polarity (DERICK), A., ii, 712.
- Ketonic acids**, dibasic, preparation of (BLAISE and GAULT), A., i, 520, 664.

Lavulinic acid, formation of, from glu-
cosamine, chitin and chitos (HAM-
BURGER), A., i, 331.
electrolytic reduction of (TAYL and
KUMMER), A., i, 764.
brucine salt (HILDTICH), T., 335.
Lavulose, proportion of, to dextrose in
preserved fruits (FAVEL and GAR-
WICK), A., ii, 1036.
densities of solutions of (LING, EYNON,
and LANE), A., i, 355.
the influence of inactive substances on
the rotation of (WENDER), A., i,
114.
selective power of vegetable cells for
(LANDERT), A., ii, 422.
Lavulosephosphoric acid, calcium salt
(NEUBERG and KRETSCHMER), A., i,
837.
Lavuloseuria (ADLER), A., ii, 311.
Lakes, constitution of (FRIEYER,
GOLDBERG, and KUNTNER), A., i, 399.
Lamp-black, electrophoresis of (SPRING),
A., ii, 15; (REYCHLER), A., ii, 250.
Lampyrine, photogenic material of
(McDERMOTT), A., ii, 1113.
Language, universal chemical (ONR-
WALD), A., ii, 267.
Lanthanum, resolution of the spectral
lines of, in the magnetic field
(RYBAR), A., ii, 1042.
rubidium acid nitrate (JANTSCH and
WIGDOROW), A., ii, 114.
thallous nitrate (JANTSCH and WIG-
DOROW), A., ii, 114.
sulphate, double salts of, with alkali
sulphates (BARRE), A., ii, 42.
disulphide (BILTZ), A., ii, 891.
Laricophloeus Meisnerianus, chemical
examination of the root of (ROGER-
SON), A., ii, 325.
Laumontite (SMITH), A., ii, 501.
Lauric acid, ammonium salt (FALCIOLA),
A., i, 175.
Lauric acid, α -amino-, synthesis of
dipeptides of (HOPWOOD and WEIZ-
MANN), T., 571; P., 55.
Lauroleone, constitution of (BREDT), A.,
i, 417.
Lauroleone (KONDAKOFF and SCHIN-
DELMEISER), A., i, 998.
Lauroic acid, amino-, derivatives of
(WEIR), T., 1270; P., 154.
Laurolic acid, constitution of
(BREDT and MARRER), A., i, 416.
Lauryl chloride, α -bromo- (HOPWOOD
and WEIZMANN), T., 572; P., 56.
Laurylalanine, α -amino-, and α -bromo-
(HOPWOOD and WEIZMANN), T., 573.
Laurylasparagine, α -amino-, and α -
bromo- (HOPWOOD and WEIZMANN),
T., 574.

Laurylglycine, α -amino-, and α -bromo-
(HOPWOOD and WEIZMANN), T., 572
P., 55.
Lauryl-leucine, α -amino-, and α -bromo-
(HOPWOOD and WEIZMANN), T., 574.
Laurylvaline, α -amino-, and α -bromo-
(HOPWOOD and WEIZMANN), T., 574.
Law of definite proportions, illustration
of the (KASTLE), A., ii, 481.
Lead, band spectrum of (LAMFREY,
A., ii, 831.
electro-deposition of (MATHES), A.,
ii, 118.
association of, with uranium in
minerals (HOLMES), A., ii, 579.
ratio of, to uranium in minerals, and
its application to measurement of
geological time (ZAMBONINI), A.,
ii, 952.
the system, silver, tin and (PALLA-
VANO), A., ii, 281.
silver and zinc, equilibrium in the
system (KREMANN and HOFMEIER),
A., ii, 884.
and silver halogen salts, ternary
systems of (MATHES), A., ii, 474.
dielectric constants of the halogen
compounds of (LENER), A., ii, 17.
action of Allium sativum juice on
(BANERJEE), P., 234.
action of seltzer water on (BARTLEY,
A., ii, 889.
Lead alloys with calcium (BAAR), A.,
ii, 611.
with silver and zinc, potential of
(KREMANN and HOFMEIER), A., ii,
848.
with tin (MAZZOTTO), A., ii, 840.
with tin and antimony (LOEB), A.,
ii, 204.
with zinc and tin (LEVI-MARINARO
and CECCARELLI), A., ii, 1088, 1099.
Lead salts, active, obtained from pitch
blende, properties of (EBERT), A.,
ii, 244.
fused, nature of the metallic fog in
(LORENZ, v. HEVEST, and WOLFF,
A., ii, 491.
behaviour of, in the stomach (THOM-
ASON), A., ii, 60.
Lead arsenate, use of, in viticulture
(MOREAU and VINET), A., ii, 335.
529.
carbonate, equilibria in the pre-
cipitation of (HERZ), A., ii, 972.
basic (SACHER), A., ii, 40.
chloride, ammonium chloride and
water, the system (BRÖNSTED), A.,
ii, 381.
fluorides, double salts of, with other
halides of lead (SANDONINI), A.,
ii, 491.

Lead halides, equilibrium of, with each other (SAFFORD), A., ii, 284.
nitrate, transference experiments with (KATZ), A., ii, 90.
and pyridine, equilibrium in the system (WALTON and JUDD), A., ii, 708.
oxide, oxidation of, in presence of light and air (KAMMER), A., ii, 284.
oxide, action of, on potassium tartrate (KRAUCKOFF), A., i, 519.
and silica, estimation of (CHWALA and COLLIS), A., ii, 441.
peroxide, estimation of, volumetrically (SACHER), A., ii, 770.
Tripleable tetroxide (red lead) (MILBAUER), A., ii, 113.
ulicates (WALKER), A., ii, 983.
potassium sulphate (BRONSTEIN), A., ii, 856.
and organic compounds:—
Lead di- γ -amyl dibromide (RENGER), A., i, 188.
di-*sec*-butyl bromide (RENGER), A., i, 188.
diethyl dibromide (TAFEL), A., i, 188.
di-*isopropyl*, salts of (TAFEL), A., i, 188.
tri-*sec*-butyl chloride (RENGER), A., i, 188.
triethyl bromide (TAFEL), A., i, 188.
tri-*isopropyl* chloride and iodide (TAFEL), A., i, 188.
d, detection of, barium, strontium and calcium (BROWNING and BLUMENTHAL), A., ii, 1032.
estimation of, electrolytically (BENZKE), A., ii, 165.
estimation of, in alloys with antimony and tin (BLAKELEY and CHANCE), A., ii, 659.
in minerals, from Kansas, Missouri (ROGERS), A., ii, 900.
nitric, action of, on diastase (LAPINSKY), A., i, 248.
and diastatic action (TERBOINE), A., ii, 997.
action of, in the Wassermann reaction (BROWNING, CHUCKSHANK, and GILMOUR), A., ii, 312.
volutions, physico-chemical properties of (HANDOVSKY and WAGNER), A., i, 408.
influence of, on absorption by the skin (ROMACHIN), A., ii, 1007.
extraction and estimation of (COHN), A., ii, 779.
estimation of (VINOHOV), A., ii, 945.
estimation of, in oil (FRESSENIUS and GUTHRIE), A., ii, 843.
nitric, detection of (CARANOVA), A., ii, 673.

Leguminosae, nutrition of nitrogen by (KITTEN), A., ii, 428.
Leucic acid. See Isohexic acid, α -hydroxy.
Leucite, optical characters of (RUFER and KOLS), A., ii, 269.
Leuco-bases derived from diphenyl-ethylene (LEMOULT), A., i, 359.
Leucocytes, enzymes of (TCHERNOMIRSKI), A., ii, 1168.
Leucomaines, new, from beef (CORREAL), A., i, 396.
Leucomalachite green, detection of blood by means of (MICHEL), A., ii, 675.
Leucomethylene-blue-sulphonic acid, amino-, zinc salt and nitro- (WEIL, DÜRRSCHNABEL, and LANDAUER), A., i, 1006.
Leucyl- α -amino- n -nonylglycine (HORDWOOD and WEIZMANN), T., 1579; P., 214.
"*Lichen quercinus viridis*," composition of (SENYT), A., ii, 527.
Lichens and their constituents (HEBER), A., i, 208.
Light. See under Photochemistry.
Lime. See Calcium oxide.
Lime saltpetre, analogs of (DINLAGE), A., ii, 1027.
Limonene, hydrogenation of (VAVON), A., i, 657.
d, and δ -Limonene nitrocarbazides and their phenylcarbamyl derivatives (FORSTER and VAN GELDEREN), T., 2064; P., 196.
Linyl bromide and its derivatives (ROUKE-BERTRAND FILS, DUPONT, and LABAUNE), A., i, 895.
***Linaria vulgaris*, phytosterol and its derivatives from** (KLOBE and GARNIER), A., i, 972.
Linoleic acid, ammonia salts (FALCHIGLIA), A., i, 175.
Linolenic acid (ROLLETT), A., i, 175.
trichloride tri-iodide (HETDACHKA and KHEINBERGER), A., i, 766.
 α -Linolenic acid and its salts and derivatives (ERDMANN), A., i, 332.
Linseed, hydrolysis of the protein of (ROBERTSON), A., i, 341.
Linseed oil (ROLLETT), A., i, 175.
Lipase, production of, by bacteria (SÖHNGEN), A., ii, 689.
heat resistant (SÖHNGEN), A., i, 825.
pancreatic, action of (HAMAIK), A., i, 411; (VINCO), A., ii, 809.
solubility of (BERZELIUS), A., i, 758.
action of serum on (SHAW-MACKENZIE), A., ii, 418.
ricinus (JALANDER), A., i, 1058.

Lipoids from animal organs (GILARD and VERHAEGEN), A., ii, 506.
of blood, action of, on blood formation (KERNOW), A., ii, 125.
of egg-yolk (BERONO and PALOZZI), A., ii, 1006.
in the liver (WILSON), A., ii, 1111.
action of, on liver diastase (ORSTANIKI), A., ii, 54; (STARKENSTEIN), A., ii, 747.
importance of, in nutrition (STEFF), A., ii, 1062.
from tissues, qualitative analysis of (SMITH and MAIR), A., ii, 1006.
estimation of halogens in (CAPPENBERG), A., ii, 927.
Liquid, apparatus for maintaining the level of a (NOGA), A., ii, 875.
rate of dissolution of a gas in a (CARLSON), A., ii, 589.
normal, expansion pressure of a (GAY), A., ii, 1058.
Liquids, properties of, and molecular attraction (KLEEMAN), A., ii, 986.
dielectric constants of, at high pressures (ORTVAY), A., ii, 961.
determination of the density of, (HARTLEY and BARRETT), T., 1072; P., 100.
capillary rise of (BIGELOW and HUNTER), A., ii, 471.
molecular association in (BATCHEVSKI), A., ii, 189.
molecular complexity of (GUYE), A., ii, 1067.
binary solutions of (MARILLIER), A., ii, 883.
determination of the specific heat of (MELLECHUR), A., ii, 851.
calculation of the latent heat of vaporization of (THORKESSON; LEWIS), A., ii, 855.
relation of vapour pressure to specific gravity in binary mixtures of (DOROSCHESKY), A., ii, 698.
surface tension at contact of two (VAN DER NOOT), A., ii, 859.
internal pressure of (AMAGAT), A., ii, 1061.
compression of, at high pressures (PARSONS and COOK), A., ii, 699.
causes of the constant temperature variation in the vapour pressure of (MICHAUD), A., ii, 371.
separation of constant-boiling mixtures of (GOLODITZ), A., ii, 1064.
thermal conductivity of (GOLDSCHMIDT), A., ii, 579.
critical solution temperatures of (MOLES), A., ii, 793.
absorption of, by porous substances (KUSCHNERBERGER), A., ii, 794.

Liquids, viscosity and molecular weight of (BINGHAM), A., ii, 372.
viscosity of, in relation to the theory of Van der Waal's theory (BRODCHOWSKI), A., ii, 258.
used for the separation of minerals viscosity of (CHERNIC), A., ii, 257.
turbulence viscosity of (BOSE and BOSE), A., ii, 257; (V. KARMAN), A., ii, 469.
anisotropic (FRIEDEL and GRANGJEAN), A., ii, 1; (GRANGJEAN), A., ii, 185.
"swarm" theory of (BOSE), A., ii, 184.
colloidal and non-colloidal, internal friction of (DIENER), A., ii, 590.
crystalline (V. WARTENBERG), A., ii, 952.
mixed, latent heats of vaporization of (TYRER), T., 1633; P., 215, 319.
relation between viscosity and fluidity of (BINGHAM and WHITE), A., ii, 858.
organic, freezing point of (TIMMERMANS), A., ii, 854.
viscosity of (SORKAT), A., ii, 721.
absorption of hydrocarbons by (MCDANIEL), A., ii, 829.
poisonous, hygroscopic or low-boiling apparatus for measuring (STEINKOFF), A., ii, 106.
Liquorice juice, analysis of (GADOIS and GADOIS), A., ii, 948.
root, estimation of glycyrrhizin and sugars in (ERIKSSON), A., ii, 349.
Lithium, absorption spectrum of (BEVAN), A., ii, 350.
compounds of nitrogen and hydrogen with (DAFERT and MIKLAUS), A., ii, 393.
Lithium alloys with mercury (SERTOFFSKY), A., ii, 832.
Lithium carbide, action of nitrogen (TUCKER and MOODY), A., ii, 844.
periodate (BARKER), T., 112; P., 193.
nitride (DAFERT and MIKLAUS), A., ii, 39.
silicates (RIEKE and ENDELL), A., ii, 490, 982.
metasilicate, fusion temperature (JAEGER), A., ii, 981.
persulphate, preparation of (OM), A., ii, 1088.
Lithium amide and -imide (ER and GORGES), A., ii, 281.
Trilithiumamide (DAFERT and MIKLAUS), A., ii, 39.
Trilithiumammonium (DAFERT and MIKLAUS), A., ii, 39.

Adrian, collection of (MURRAY), A., ii, 334, 439.
estimation of, in water (GAUTIER and MORTIER), A., ii, 300.
Aschebelle acid (FROBERG), A., i, 265.
Asma, preparation of a sensitive and stable solution of (FUSCHEL), A., ii, 167.
Ases, functions of the (WERNLE), A., ii, 812.
Work done by the (VERZAR), A., ii, 748.
magnitude of the work of (FORGES), A., ii, 1006.
parallelism between the glycogenic and antitoxic functions of the (GILBERT), A., ii, 757.
autolysis of the tissue of the, effect of thyroid administration on (COOK and BEERS), A., ii, 415.
the tryptic and autolytic actions of the (SIMON), A., ii, 54.
formation of amino-acids in the (EMDEN and SCHMITZ), A., ii, 53.
degradation of carbohydrates in the (WIRTH), A., ii, 629.
influence of fats on the activity of ferments in the (CHOAT), A., ii, 747.
formation of glycogen in the (SCHÖNDORFF and SÜCKROW; SCHÖNDORFF and GREEN), A., ii, 306; (MÜRSCHHAUSER and HAFPMANN), A., ii, 414.
distribution of glycogen in the (MACLEOD and PRANCE), A., ii, 219.
relation of the kidney to the glycogen of the (GRONWALD), A., ii, 130.
lipoids in the (WILSON), A., ii, 1111.
influence of lipoids on diastase of the (STARKENTHEIN), A., ii, 747.
maltae in the (DOXIADIS), A., ii, 619.
effect of narcotics on oxidation in the (JOANNOVICS and PICK), A., ii, 628.
nucleic acid in the (MASINO), A., ii, 1111.
formation of sugar in the (LOEWITZ), A., ii, 120.
influence of the, on the combustion of sugar (VERZAR), A., ii, 746.
chemical changes in the, in pathological processes (SLOWITZOFF and SOBOLEFF), A., ii, 310.
influence of potassium iodide on the accumulation of mercury in the (BLUMENTHAL and OPPENHEIM), A., ii, 1014.
chemical changes in the, after phosphorus poisoning (SLOWITZOFF), A., ii, 315; (WOHLERUTH), A., ii, 517.
hecase of the, purine metabolism in (LA FRANCA), A., ii, 1013.

Liver of area, analysis of (DANIEL-BRUNET and ROLLAND), A., ii, 1111.
Lophira alata, composition of fat from the seeds of (PICKLES and HATWORTH), A., ii, 1024.
Luhlaite (MOROSIEWICZ), A., ii, 122.
Lusiferococaine (McDERMOTT), A., i, 294.
Luminascence, chemical, lecture experiment for showing (HEZKO), A., ii, 269.
of hydrocarbons and their derivatives (STORER and ERENT), A., ii, 562.
Lupanine and its salts (BECKEL), A., i, 743.
Lupasee (SCHULZ and FRENKING), A., i, 17.
Lupinus, sensitiveness of, towards lime (PFIEFFER and BLANCH), A., ii, 761.
2:6 Lutidine salts (DERN and DEWEY), A., i, 915.
Lutidons, velocities of reaction of, with phenylhydrazine and with hydroxylamine (SCHOTTLE), A., ii, 1079.
Lymph, surface tension of (BUGLIA), A., ii, 1113.
passage of immune substances into (LUCKHARDT and BRECHT), A., ii, 217.
chemical reaction of (QUAGLIARIELLO), A., ii, 1114.
action of, on diastases (WOHLERUTH), A., ii, 743.
spaces, migration of solutions through the (MELTZER), A., ii, 320.
physiology of (CARLSON, WOHLVEL and POWELL), A., ii, 620.

M.

Magnesite, Alpine deposits of (GROSS PIETSCH), A., ii, 807.
Magnesium, presence of, in aluminium alloys (WILM), A., ii, 493.
metabolism. See Metabolism.
Magnesium alloys with aluminium (BRONIEWSKI), A., ii, 115.
with cadmium, electrical conductivity and hardness of (UZAZOFF), A., i, 887.
with calcium (BAAR), A., ii, 611.
with silver, electrical conductivity and hardness of (SMIRNOFF and KURNAKOFF), A., ii, 888.
Magnesium salts, soluble, action of potassium hydrogen carbonate on (NANTY), A., ii, 282.
Magnesium carbonate, equilibrium between, and potassium hydrogen carbonate (NANTY), A., ii, 103.
isomorphous mixtures of, with calcium and iron carbonates (DIECKL), A., ii, 736.

- Magnesium, cadmium and rubidium chromates** (BARKER), T., 1337; P., 193.
- Magnesium organic compounds, formation of** (STADNIKOFF), A., i, 435; (ODDO), A., i, 443.
- transpositions with** (ODDO), A., i, 433.
- action of, on the cinchona alkaloids and on styrene** (ODDO), A., i, 433.
- action of, on anhydrides of dicarboxylic acids** (BAUER; BAUER and WÖLZ), A., i, 371.
- reaction of, with cinnamylidene esters** (REYNOLDS), A., i, 360.
- action of, on ethyl orthoformate** (SHANOVITSCH), A., i, 10.
- action of, on methyl acetylpyrrolate** (BARBER and LOCQUIN), A., i, 708.
- action of, on thionyl chloride and sulphur dioxide** (ODDO), A., i, 286.
- Magnesium methyl iodide, estimation of traces of water by means of** (ZEREWITNOFF), A., ii, 1026.
- ludenyl bromide** (GRIGNARD and COURTOT), A., i, 193.
- phosphoribide, (WILLSTÄTTER and STOLL), A., i, 143.**
- Magnesium, separation of, from calcium** (MURMANN), A., ii, 440.
- estimation of, as oxide** (KALLAUKER), A., ii, 1032.
- estimation of, in hard water** (NOTH-NAGEL), A., ii, 1031.
- Magnetic double refraction. See under Photochemistry.**
- field, use of, for the determination of constitution in organic chemistry** (PASCAL), A., ii, 91, 183, 251, 252, 464, 679, 850, 1058.
- moments of molecules, relation of, to the magneton** (WEISS), A., ii, 694.
- properties of alloys of copper, manganese and tin** (ROSS and GRAY), A., ii, 183.
- rotation. See under Photochemistry.**
- substances, solid, magneton in** (WEISS), A., ii, 367.
- Magnetisation of cobalt and nickel salts** (WEISS and FOX), A., ii, 183.
- of ferro-magnetic substances at high temperatures** (WEISS and FOX), A., ii, 250.
- Magnetism at low temperatures** (WEISS and ONNES), A., ii, 15; (ONNES and PERRIER), A., ii, 694.
- of complex salts** (FEYTS), A., ii, 367.
- Magnetite, micro-structure of** (MÜGG), A., ii, 1101.
- Magneton** (WEISS), A., ii, 183.
- in solid paramagnetic substances** (WEISS), A., ii, 367.
- Magneton, relation of, to the magnetic moments of molecules** (WEISS), A., ii, 694.
- magnetic saturation of** (WEISS), A., ii, 250.
- Maise, effects of nutrition with** (B. LIONI), A., ii, 999.
- experimental chlorosis of** (MALE), A., ii, 1126.
- Maleic acid, synthesis of, from acetylene di-iodide** (KEISER and McMASTERS), A., i, 949.
- photochemical inversion of** (BETZ and KRÖLIKOWSKI), A., i, 9.
- isomerism of, and fumaric acid** (GLAMANN), A., i, 261.
- Maleic acid, bromo-, benzylamine salt of** (FRANKLAND), T., 1779; P., 296.
- Maleic dialdehyde, α-bromo-β-hydroxy-, dibromo-, and their derivatives** (CHAVANNE), A., i, 737.
- Maleinamil, iminohydroxy-** (DUEA MANN), A., i, 457.
- Maleic acid, preparation of, from "sands"** (WARREN), A., ii, 321.
- oxidation of, by animal bodies** (BATTELLI and STERN), A., ii, 412.
- consumption of, during fermentation** (MESTREZAT), A., ii, 421.
- estimation of, polarimetrically** (YODER), A., i, 1141.
- Malic acid, influence of electrolytes on the optical activity of, in aqueous solution** (STUBBS), T., 2265; P., 211.
- Malonamide, condensation of, with ethyl and methyl diethylmalonate** (RIFRY), T., 620.
- Malonic acid, influence of alkyl substituents on the conductivity of** (MELDRUM), A., ii, 692.
- condensation of αβ-dibromomaleic hyde with** (LESTREAU), A., i, 164.
- action of, on starch and dextrin** (OECHSNER DE CONINCK and RAYNAUD), A., i, 770.
- diethyl ester, sodium derivative, condensation of, with ethyl citraconate** (HOPE), P., 231.
- Malonic acid, bromo-, methyl ester** (KÖHLER, HERITAGE, and MAYER), A., i, 364.
- nitro-, ethyl ester, salts of** (CHIES and KOSTALEK), A., i, 518.
- Malonylbisindine** (REMFREY), T., 611.
- Malonylmalonamide and its sodium salt** (REMFREY), T., 615; P., 73.
- Malt, composition of embryos of** (MURRAY), A., ii, 325.
- diastases of, influence on the properties of** (FERNBACH and SCHEN), A., i, 10.
- Maltase in blood-serum and sweat** (DOXIADIS), A., ii, 619.

- Maltose**, denatation of solutions of (LANG, EYKHO, and LANG), A., i, 354.
 mutarotation of (SCHLIEPBACK), A., i, 16.
- Maltose-*o*-carboxyanilide** (IRVINE and HYND), T., 145; P., 9.
- Mammalian tissues**, indophenol oxydase of (VERNON), A., ii, 905.
- Mammary glands**. See Glands.
- Mandelic acid**, *p*-hydroxy- (*p*-hydroxy-phenylglycolic acid), preparation of (ALOT and RABAUT), A., i, 780.
- Manganese**, refraction and absorption of (FREDERICKS), A., ii, 349.
 influence of, on the properties of steel (LANG), A., ii, 206.
 biochemistry of (PICCININI), A., ii, 622.
 influence of, on plant development (STOKLARA), A., ii, 843.
 influence of, on the development of *Aspergillus niger* (BERTRAND and JAVILLIER), A., ii, 222.
 and zinc, joint influence of, on the development of *Aspergillus niger* (BERTRAND and JAVILLIER), A., ii, 421.
 metabolism. See under Metabolism.
 manurial experiments with (LEIDREITER), A., ii, 923.
 function of, in manure (BERNARDINI), A., ii, 327.
 in soils (CONTINO), A., ii, 649.
 in wines (PRANDI and CIVETTA), A., ii, 648.
- Manganese alloys** with copper and tin, magnetic properties of (ROSS and GRAY), A., ii, 183.
 with thallium (BAAR), A., ii, 611.
- Manganese antimonide**, bismuthide and phosphide (HILPERT and DIECKMANN), A., ii, 1090.
 arsenides (ARRIVAUT), A., ii, 399.
 arsenide, bismuthide, silicide, selenide, sulphide and telluride (WEDKIND, VEIT, and FETZER), A., ii, 985.
 preparation of (HILPERT and DIECKMANN), A., ii, 985.
 boride (HOFFMANN), A., ii, 116.
 dioxide, action of selenious acid with (MARINO and SQUINTANI), A., ii, 608.
 use of colloidal solutions of, in biochemical oxidation (SJOELLENA), A., i, 411.
 colloidal, action of, with hydrogen peroxide (BARDIG and MARCK), A., ii, 399.
 sulphate, manurial value of (CARLIER), A., ii, 147; (MARONI), A., ii, 821.
- Manganates**, thermal formation of (BACKEUS), A., ii, 400.
- Permanganates**, absorption spectra of (MEATON), T., 637; P., 65.
- Manganese oxide**, mixtures of, with silica (DOERFSCHELL), A., ii, 608.
- Manganese**, precipitation of, as carbonate (SCHIRM), A., ii, 1138.
 detection and estimation of small quantities of (BERTRAND), A., ii, 542.
 estimation of (BAIKOW and TISCHOFF), A., ii, 936.
 estimation of, modifications of Volhard's method for (CAHEN and LITTLE), A., ii, 229.
 estimation of, electrolytically, deposition of chromium in the (KOSTER), A., ii, 230.
 estimation of, in honey (GOTTFRIED), A., ii, 824.
 estimation of, in steel (KAYSER), A., ii, 70.
 quantitative separation of iron and (SANCHEZ), A., ii, 1138.
- Manganitartaric acid**, sodium salt (JON and GOINSEKKT), A., i, 176.
- Manninotriose**, fermentation of, and its carbamide (BIERRY), A., i, 263.
- Mannitoboric acid** and its salts (FOX and GAUGE), T., 1075; P., 136.
- Mannose-*o*-carboxyanilide** (IRVINE and HYND), T., 164; P., 9.
- Manometer**, glass, some forms of (JACKSON), T., 1066; P., 45.
- Manure**, function of manganese in (BERNARDINI), A., ii, 327.
- Mannres**, nitrogenous, from the atmosphere, field trials with (HENDRICK; BAERLEK), A., ii, 650.
 for sugar beet (EUBEN, PRACHFELD, and VILIKOVSKY), A., ii, 65.
 organic, availability of (LIPMAN, BROWN, and OWEN), A., ii, 924.
- Manurial experiments** (WAGNER SCHULZE), A., ii, 65.
 in pots and in the field (COHEN), A., ii, 783.
 with manganese (LEIDREITER), A., ii, 923.
 with wheat and barley (POLLE), A., ii, 224.
- Marasite**, constitution of (PLUMMER), A., ii, 901.
 crystallography of (PöSCHL), A., ii, 208.
- Marjoram oil**, Spanish (DORRONSORO), A., i, 74.
- Maronol** (SCHIMMEL & Co.), A., i, 894.
- Matahee**, characteristics and composition of early (CLAYTON), P., 229.

INDEX OF SUBJECTS

- Matricaria chamomilla*, phytesterols and their derivatives from (KLOSE), A., i, 972.
- Matter, a new constituent of (WENGE), A., ii, 183.
- chemical composition of (MULDER), A., ii, 83.
- state of aggregation of (SCHREYVE), A., i, 245.
- observations unexplained by the atomic and molecular structure of (MAGNANINI), A., ii, 710.
- radioactivity as a property of (WULF), A., ii, 709.
- Meat, estimation of phosphorus in (GRINDLEY and ROSE), A., ii, 232.
- Meat extract, physiological value of (VOLTZ and BAUDREXEL), A., ii, 214.
- Meat juice, alkali phosphate in (SALKOWSKI), A., ii, 39.
- Meconic acid, crystallography of (GAUBERT), A., ii, 101.
- Meconine, bromo-, chloro-, and iodo- (PERKIN and ROBINSON), T., 783.
- Mesonium, occurrence of hematoporphyrin in the (BORRIEN), A., ii, 138.
- Melamasine and its salts, from dicyanodiamide (HOFMANN and EHRHART), A., i, 843.
- Melanin (GORTNER), A., ii, 908.
- Melanin pigments (PIETTRE), A., i, 1006.
- Melanite from Sutherlandshire (GEMMELL), A., ii, 900.
- Melanterite from Siens (MANASSE), A., ii, 499.
- Melitin (BRIDEL), A., i, 659.
- Mellissone and its oxime (EASTERFIELD and TAYLOR), T., 2303; P., 279.
- Melting-point apparatus (SEIDELL), A., ii, 254.
- lines, retrogressive (SMITS; SMITZ and TREUB), A., ii, 855.
- Membranes, cause of the permeability of (MOORE, ROAF, and WEBSTER), A., ii, 1072.
- semi-permeable, preparation of (FOUARD), A., ii, 267.
- Memorial lecture, Berthelot (DIXON), T., 2353; P., 270.
- $\Delta^{8,9}$ -Menthadiene (HENDERSON and BOYD), T., 2161; P., 277.
- cis*- and *trans*- $\Delta^{3,8(9)}$ -*o*-Menthadiene (PERKIN), T., 751; P., 95.
- $\Delta^{4,9(10)}$ -*o*-Menthadiene (PERKIN), T., 757; P., 95.
- $\Delta^{8,9(10)}$ -*o*-Menthadiene (PERKIN), T., 737; P., 95.
- $\Delta^{3,8(9)}$ -*o*-Menthadiene (PERKIN), T., 740; P., 95.
- d*- and *dl*- $\Delta^{3,8(9)}$ -*m*-Menthadiene, synthesis of, and dihydrochloride of the former (HAWORTH, PERKIN, and WALLACH), T., 126, 129; P., 4.
- d*- and *l*- $\Delta^{3,8(9)}$ -*m*-Menthadiene (LUFF and PERKIN), T., 525; P., 57.
- $\Delta^{2,3,8(9)}$ -*p*-Menthadiene (CHOU and PERKIN), T., 537; P., 57.
- Menthadiol from α -pinol hydrate (WALLACH), A., i, 470.
- l*-, and *m*-Menthanol, phenylurethane of (WALLACH), A., i, 470.
- p*-Menth-3-ol, phenylurethane of (WALLACH), A., i, 470.
- Menth-3-ene, 1-bromo-, 1- and 1-chloro-, and 1-hydroxy- (KÖTZ and STEINHOFF), A., i, 211.
- Menth-3-ene, 4-bromo-, and 4- and 5-chloro- (KÖTZ and STEINHOFF), A., i, 211.
- Mentha piperita*, peppermint oil from leaves of (MURADOUR), A., i, 134.
- $\Delta^{4,9}$ -*m*-Menthene (KJNER and ZAVADOVSKY), A., i, 1029.
- Δ^2 -Menthene dibromide (HENDERSON and BOYD), T., 2161; P., 277.
- cis*- and *trans*- Δ^3 -*o*-Menthenol (PERKIN), T., 751; P., 95.
- Δ^4 -*o*-Menthenol (8) and its phenylurethane (PERKIN), T., 756; P., 94.
- Δ^3 -*o*-Menthenol (8) and its phenylurethane (PERKIN), T., 736; P., 95.
- Δ^4 -*o*-Menthenol (8) (PERKIN), T., 740; P., 95.
- d*- and *dl*- Δ^2 -*m*-Menthenol (8), synthesis of, and their phenylurethanes (HAWORTH, PERKIN, and WALLACH), T., 125, 129; P., 4.
- d*-, and *l*- Δ^2 -*m*-Menthenol (8) (LUFF and PERKIN), T., 525; P., 57.
- d*- Δ^3 -*p*-Menthenol (8) (CHOU and PERKIN), T., 537; P., 57.
- o*-Menth-5-one, hydrochloride of the oxime, and semicarbazone of (KÖTZ and ANGER), A., i, 309.
- Menthol, carbonic acid esters of (EINHORN and ROTHLAUF), A., i, 705.
- ethoxycacetyl derivative of (KINROSS), A., i, 137.
- Menthols (PICKARD and LITTLEBURY), P., 324.
- β -Menthol-lactoside and its heptaacetyl derivative (FISCHER), A., i, 217.
- Menthone, inversion of (TUBANDT, MOHS, TUBANDT, and WUHAUSEN), A., ii, 28.
- action of magnesium ethyl iodide = (VANIN), A., i, 474.
- action of zinc and allyl iodide = (SAYTZEFF), A., i, 474.

- Hexamethylenedinitrochloride and nitro-
pyridine** (WALLACE and HENJIM),
A., i, 312.
- Hexamethylene acid, allyl and propyl
esters** (FRANKLAND and O'SULLIVAN),
T., 2332; P., 312.
- Hexamethylene allylamide** (FRANKLAND
and O'SULLIVAN), T., 2331; P., 319.
- propylamide** (FRANKLAND and
O'SULLIVAN), T., 2332; P., 319.
- Hexamethylene acid, di- and 4-
butyl esters** (PICKARD and KENTON),
T., 64.
- Hexylglyceric acid, preparation of**
(BAGO), A., ii, 664.
- Hexanthes trifoliata, new glucoside**
from (BRIDEL), A., i, 659.
- Mercury, spectrum of** (PASCHEM), A., ii,
823.
- line spectrum of** (GLAGOLEFF), A., ii,
450.
- vacuum tube spectra of** (HORTON),
A., ii, 559.
- long-waved radiation from the vapour**
of (RUBENS and v. BAERER), A., ii,
850.
- pure, electrical resistance of, at helium
temperatures** (OMMEN), A., ii, 575,
637.
- colloidal** (AMBERGER), A., ii, 205.
- reducing actions of** (BORAR), T., 1414;
P., 123.
- mercuric oxide electrode. See Elec-
trode under Electrochemistry.**
- action of *Allium sativum* juice on**
(BARNER), P., 234.
- antiseptic solutions of, action of caout-
chouc on** (GLENNY and WALPOLE),
A., ii, 141.
- influence of ferric salts and of mangan-
ese nitrate on the rate of solution of,
in nitric acid** (RAY), T., 1012; P., 4.
- vapour, influence of gases on the fluor-
escence of** (FRANCK and WOOD), A.,
ii, 169.
- action of, on sodium** (KAHLENBERG
and KLEIN), A., ii, 723.
- sodium chloride, and nickel and
platinum, reactions in the system**
(PETERS), A., ii, 1095.
- pharmacological action of insoluble
preparations of** (FILIPPI), A., ii, 1014.
- complex compounds of, with cinnamic
acid and its esters** (SCHRAUTH,
SCHOKLER, and STRUNZEE), A., i,
595.
- therapeutics of syphilis and spirilliosis**
(LAUNOY and LEVADITI), A., ii, 912.
- influence of potassium iodide on
the accumulation of, in the liver**
(BLUMENTHAL and OFFENHEIM),
A., ii, 1014.
- Mercury alloys (amalgams) with**
arsenic (DUMENIL), A., ii, 403.
- with cadmium, conductivity of** (CALVO),
A., ii, 578.
- with lithium** (SCHUCKOFFERT), A., ii,
682.
- with organic substances** (McCOY and
MOORE), A., i, 270.
- with silver, relation of the conductivity
of, to temperature** (CALVO), A., ii,
574.
- with silver and tin** (JOYNER), T., 196;
P., 5.
- Mercury oxychlorides** (DRIOT), A., ii,
397.
- Mercuric bromide, chloride and iodide,
vapour pressures of** (JOHNSON),
A., ii, 737.
- chloride, kinetics of the reduction of,
by phosphorous acid** (GARNER,
FOGLESONO, and WILSON), A.,
ii, 972.
- action of, on glycine** (SIGGFRIED),
A., i, 427.
- caesium chloride** (FOOTE and HARRIS),
A., ii, 397.
- silver iodide, uniformity of** (WE-
GELIN), A., ii, 884.
- oxide, action of, on hydrazine
hydrate** (HALE and NUNES),
A., i, 845.
- Mercurous chloride, vapour pressure
of** (SMITH and MENZIES), A., ii, 492.
- Mercury:—**
- Mercurous chloride vapour, constitu-
tion of** (SMITH and MENZIES),
A., ii, 114.
- reactions of** (HERZ), A., ii, 285.
- perchlorate, voltameter with** (MATH-
ERS and GERMANN), A., ii, 877.
- nitrate, action of ammonia** (SAMA
and CHOUDEHURI), A., ii, 804.
- sulphate as a depolariser in normal
cells** (VAN GINNEKEN), A., ii, 179;
(HULETT), A., ii, 848.
- Dimereurammonium compounds** (GAU-
DECHON), A., ii, 398.
- Mercury organic compounds, aromatic,
biochemistry of** (SCHRAUTH and
SCHOKLER), A., ii, 637; (BLUMEN-
THAL), A., ii, 1017.
- disinfecting power of** (SCHRAUTH and
SCHOKLER), A., ii, 63.
- pharmacology of** (MÜLLER, SCHOKLER,
and SCHRAUTH), A., ii, 765.
- aromatic, physiological action of**
(BLUMENTHAL), A., ii, 517.
- Mercurianilineacetic acid, o-bromo-, o-
chloro-, and o-iodo-, ethyl esters, and
o-hydroxy, metallic salts and subhy-
dride of** (SCHOKLER, SCHRAUTH, and
GOLDACKER), A., i, 699.

- Mercurianilinebutyric acid**, *a*-dibromo-, *a*-dichloro-, and *a*-di-iodo-, ethyl esters and *a*-dihydroxy-, anhydride (SCHÖLLER, SCHRAUTH, and GOLDBACKER), A., i, 700.
- Mercurianilinepropionic acid**, *a*-dibromo-, *a*-dichloro-, and *a*-di-iodo-, ethyl esters and *a*-dihydroxy-, anhydride of (SCHÖLLER, SCHRAUTH, and GOLDBACKER), A., i, 700.
- Mercurianilineisovaleric acid**, *a*-dibromo-, *a*-dichloro-, and *a*-di-iodo-, ethyl esters and *a*-dihydroxy-, anhydride (SCHÖLLER, SCHRAUTH, and GOLDBACKER), A., i, 700.
- Mercurianilineoxy acids**, hydroxy-, preparation of soluble compounds from (FARBENFABRIKEN VORM. F. BAYER & Co.), A., i, 594.
- Mercury**, detection of (MOORE), A., ii, 771.
- detection of, in explosives (PATTENON), A., ii, 442.
- spectroscopic detection of, in explosives (FLORIN), A., ii, 1033.
- detection of, in urine (SALKOWSKI), A., ii, 771, 934.
- estimation of, volumetrically (RINTHALER), A., ii, 660; (SMITH), A., ii, 824.
- estimation of, in soluble mercuric salts (PROCTER and SEYMOUR-JONES), A., ii, 541.
- estimation of, colorimetrically in urine (HEINZELMANN), A., ii, 772.
- Mesolite** from Palagonia, Sicily (PONTE), A., ii, 298.
- Mesothorium** (MARCKWALD), A., ii, 8.
- chemistry of (SODDY), T., 72.
- chemical and radio-active properties of (HAHN), A., ii, 845.
- action of, on animal germ cells (HEINTZ), A., ii, 1188.
- Mesoxylic acid**, preparation of esters of (MEYER), A., i, 420.
- brucine salt (HILDITCH), T., 235.
- Metabolism** in a case of glycosuria (MEDIQRECEANU and KRISTELLER), A., ii, 417.
- function of hormones in regulating (ARMSTRONG and ARMSTRONG), A., ii, 642.
- with resected small intestine (UNDERHILL), A., ii, 214.
- of matter and energy, influence of blood transfusion on the (HÄRI), A., ii, 739.
- effect of parathyroidectomy on (GREENWALD), A., ii, 507.
- relation of sex to (KRAUSE and CRAMER), A., ii, 752.
- Metabolism**, action of sulphur compounds on (JORG), A., ii, 742.
- relative value of food- and body-protein in (v. HOSSELY and LEASEL), A., ii, 904.
- relation of sulphur and phosphorus in (GROSS), A., ii, 810.
- increase in, due to the work of typewriting (CARPENTER), A., ii, 621.
- animal, use of "romanzankalk" in (HAGEMANN), A., ii, 507.
- calcium (VOORHOEVE), A., ii, 124, 622.
- during lactation, effect of mineral waters on (COLESCH), A., ii, 507.
- dependence of, on the organic food constituents (KOCHMANN), A., ii, 410.
- of calcium phosphate (BERG), A., ii, 134.
- of calcium, magnesium and phosphorus, influence of food on the (KOCHMANN and PETERS), A., ii, 506.
- carbohydrate (RACH), A., ii, 743; (UNDERHILL), A., ii, 910.
- and diabetes (PAVY and GORDON), (UNDERHILL and FINE), A., ii, 1001.
- behaviour of acetone substances in (GELLMUYDEN), A., ii, 904.
- effect of ether on (GRUBE), A., ii, 303.
- effect of mucic acid on (MEYER and ROSE), A., ii, 410; (ROSE), A., ii, 904.
- by bacilli of the *Proteus* group (GLENN), A., ii, 639.
- creatine and creatinine (MÜNCH and ROSE), A., ii, 1002, 1007; (ROSE), A., ii, 1012.
- creatine and creatinine, in dogs with Eck fistula (FOSTER and FISHER), A., ii, 744.
- of creatinine (VOEGTLIN and TOWLE), A., ii, 411.
- fat, in absence of pancreatic juice (JANSEN), A., ii, 623.
- gaseous, in anaphylaxis (LOEWING), A., ii, 993.
- influence of intake of food on (GIGON), A., ii, 741.
- human, influence of high altitudes on (v. WENDT), A., ii, 506.
- iron, effect of diet on (KOCHMANN), A., ii, 1004.
- manganese (PICCININI), A., ii, 622.
- nitrogen, by bacteria (BOHNCKE), A., ii, 638.
- nitrogen, influence of ammonium salt on (FESCHER), A., ii, 1002.

- Metabolism, effects of loss of blood and prolonged inanition on** (FUCHS), A., ii, 54.
 effect of injections of sodium chloride on (TROSIANI), A., ii, 184.
 of the coyote (HUNTER and GIVENS), A., ii, 303.
 nuclei, in the dog (LEVEN and MEDJORECHANU), A., ii, 303.
 of oxalic acid (POHL), A., ii, 51.
 phosphorus (GROESEN), A., ii, 304.
 proteins (LOKS), A., ii, 51; (FRANK and SCHITTENHELM), A., ii, 127; (DE WARLE and VANDEVELDE), A., ii, 128; (FRANK and SCHITTENHELM), A., ii, 904.
 influence of alcohol on (SALANT and RINGER), A., ii, 411.
 influence of various foods on (WOLF and OSTERBERG), A., ii, 1003.
 effect of pregnancy on (MURLIN), A., ii, 1004.
 of the dog, effect of chloroform on the (LINDSAY), A., ii, 303.
 of the fetus (LINDSAY), A., ii, 1115.
 effect of muscular work on (PROLISE), A., ii, 624.
 in phloridiz diabetes (WOLF and OSTERBERG), A., ii, 512.
 purine (SCAFFIDI), A., ii, 218, 507, 625.
 importance of allantoin in (HUNTER and GIVENS), A., ii, 218.
 influence of phenylcinchoninic acid (atophan) on (STARRENSTEIN), A., ii, 753.
 in liver disease (LA FRANCA), A., ii, 1013.
 action of atophan on (FROMHERZ), A., ii, 1016.
 of starch (VREZAR), A., ii, 744.
 of sulphur, effect of colloidal sulphur on (MAILLARD), A., ii, 622.
 uric acid, in rabbits (ACROVD), A., ii, 747.
 estimation of sulphur in (TAYLOR), A., ii, 410.
- Metaborates.** See under Boron.
- Metal,** potential differences between a, and electrolytes (GUYOT), A., ii, 1054.
- Metallie chlorides, thermal analysis of binary mixtures of** (MENGE), A., ii, 982; (SANDONINI and SCARPA), A., ii, 984.
 solidification of aqueous solutions of (SPERANSKY and PAVLINOVA), A., ii, 1037.
 fluorides, crystallography of (DE SCHULTEN), A., ii, 605.
- Metallie halides, thermal analysis of mixtures of** (HEERMANN), A., ii, 801.
 additive organic compounds of (MENSCHEFFIN), A., i, 942.
 ions, relation between the absorption spectra of, and their valency (CRYMALE), P., 68, 328.
 nitrides, preparation of (VOURNASOS), A., ii, 600.
 oxides, action of hydrogen fluoride on (VAN HAAGEN and SMITH), A., ii, 894.
 action of, with phosphoryl chloride (HASSETT and TAYLOR), T₆, 1402; P., 155.
 action of thionyl chloride on (DARZEN and BOURION), A., ii, 878.
 catalytic action of esters by (SARATIER and MAILHE), A., i, 943.
 peroxides, constitution of (TUBAND and KIEDEL), A., ii, 987.
 salts, action of ultra-violet light on (BRETHELOT and GAUDICHON), A., ii, 242.
 and mixtures of salts, electrical conductivity of (BRENNATH and WAINOFF), A., ii, 847.
 conductivity and dissociation of (HOWARD and JONES), A., ii, 960; (WINSTON and JONES), A., ii, 961.
 compounds of, with hexamethylenetetramine (BARBIERI and CALZOLARI), A., i, 184, 266, 268; (BARBIERI and LANZONI), A., i, 268.
 hydrazinates of (FRANZEN and LUCKING), A., ii, 285.
 compounds of, with nitrous oxide (KOHLSCHÜTTER and SAZANOFF), A., ii, 730.
 sulphides, action of carbonyl chloride on (CHAUVENET), A., ii, 602.
 alkyl sulphates, hydrolysis of (DRUSHEL and LINHART), A., ii, 707.
- Metallography, solid colloidal solutions in** (BENEDICKS), A., ii, 25; (LOTTERMÖSER), A., ii, 194.
- Metals, spectra of combustion of** (MEUNIER), A., ii, 679.
 photoelectric effect of (POHL and PRINGHEIM), A., ii, 787; (LINDEMANN), A., ii, 788.
 influence of radium rays on the photoelectric sensitiveness of (DEMERE), A., ii, 587.
 velocity of emission of electrons by (HUGHES, KOVARIK, and ZAKSZEWSKI), A., ii, 572; (HABER and JUST), A., ii, 964.

Metals, heated, formation of positive ions by (KLEMMENIEWICZ), A., ii, 1080.

relation between the optical constants and potential of (FREDERICKS), A., ii, 449.

galvanic self-induction of (VAN DERVENTER), A., ii, 693.

electrical conductivity of, on liquefaction (WAGNER), A., ii, 177.

heat liberated during the absorption of electrons by (RICHARDSON and COBBE), A., ii, 358.

thermoelectric forces of solid solutions of (BERNOULLI), A., ii, 343.

thermal expansion of (GRÜNEISEN), A., ii, 851.

elasticity and thermal expansion of (SIEGELERSCHMIDT), A., ii, 851.

conduction of, number of electrons concerned in (NICHOLSON), A., ii, 886.

variation of the Thomson effect with temperature in (CERMAK), A., ii, 177.

influence of pressure on the melting-points of (JOHNSTON and ADAMS), A., ii, 696.

influence of temperature on the compressibility of (GRÜNEISEN), A., ii, 188.

relation between the temperature-coefficient and the specific resistance of (LINDESK), A., ii, 176.

passivity of (DUNSTAN and HILL), T., 1833; P., 222; (KISTIAKOWSKY), A., ii, 401; (FLADE), A., ii, 461; (GRAVE), A., ii, 896.

formation of solid solutions of (BRUNI and MENEGHINI), A., ii, 703, 860.

alloys of, with silicon (FRILLEY), A., ii, 879.

velocity of solution of, in dissolved iodine (VAN NAME and BOSWORTH), A., ii, 973.

action of ammonium trinitride on (BROWNE and HOULEHAN), A., ii, 1085.

corrosion of (LONGMUIR), A., ii, 1089.

corrosion of, in sodium trinitride solution (TURBENTINE), A., ii, 693.

aerial oxidation of (DUNSTAN and HILL), T., 1835; P., 221.

action of hydrogen sulphide on the alkyl oxides of (RULE), T., 558; P., 60.

sulphuration of (OHMANN), A., ii, 481.

action of sulphuryl chloride on (NORTH), A., ii, 798.

decomposition of water by (KEEN-BAUM), A., ii, 716.

Metals, bivalent, organic persulphates of (BARON and CALZOLARI), A., ii, 81.

compounds of organic salts of with ammonia, pyridine and phenylhydrazine (GROSSMANN and JÄGER), A., i, 944.

colloidal, solutions of (LORENZ), A., ii, 379.

solubility of, in distilled water (TRAUER-MENGARINI and SALA), A., ii, 116.

action of, on guaiaconic acid (BOCKMASTER), A., i, 390.

pharmacological action of (GROSS and O'CONNOR), A., ii, 418.

rare, action of salicylic acid on acids of the (MULLER), A., ii, 940.

univalent, thermal analysis of binary mixtures of the chlorides of (SANDONNINI), A., ii, 800.

thermal analysis of mixtures of cuprous chloride with chlorides of (SANDONNINI; FONA and GABBI; DE CESARIS), A., ii, 604.

volatile, vapour-pressure curves and heat of evaporation of (GREENWOOD), A., ii, 468.

recovery of hammered (GUILLET), A., ii, 97.

of the iron group, magnetisability of salts of (WEBER), A., ii, 1057.

of the platinum group, physical properties of alloys of (GRIBEL), A., ii, 10, 361.

precipitation of, from solutions of the salts by hydrogen (PATRIE and WERKHOVSKY), A., ii, 716.

replacement of, from non-aqueous solutions, and their solubility in oleic acid (GATES), A., ii, 394.

action of, on the reagents for blood (MICHEL), A., ii, 556.

reactivity of halogen atoms towards (STAUDINGER, CLAR, and CALA), A., i, 624.

action of, on aromatic keto-chlorides (NORRIS, THOMAS, and BROWN), A., i, 81.

resistant, action of phosphoric acid on (WUNDE and JEANNERET), A., ii, 719.

giving sulphides insoluble in dilute acids, rapid detection of (PATEL and ESCOT), A., ii, 940.

of the platinum group, qualitative detection of (CURTMAN and ROTHE), A., ii, 661.

estimation of, electrolytically (PERRY and HULETT), A., ii, 433.

apparatus for the electrolytic separation of (SMALLEY), A., ii, 434.

- Metals, separation of, without using hydrogen sulphide** (KALKER), A., ii, 532.
- use of ether in separation of** (MYLIND and HÖTTNER), A., ii, 540.
- qualitative analysis of, without hydrogen or ammonium sulphides** (FAMFILL), A., ii, 1080; (ROCHER), A., ii, 1031.
- Metaphosphates.** See under Phosphorus.
- Metarsingytic acid.** See under Tungsten.
- Meteoric iron, synthesis of** (BENEDICKS), A., ii, 485.
- from Alexandria** (MEUNIER), A., ii, 1104.
- from Colorado** (HEADDEN), A., ii, 1106.
- Meteoric stone, from Dokachi** (CLARK and BOWMAN), A., ii, 616.
- from Seeland** (BHEZINA), A., ii, 48.
- Meteoric stones** (WAHL), A., ii, 47.
- Meteoric studies** (FARRINGTON), A., ii, 407.
- Methane, equilibrium of the formation of** (PRISO and FAIRLIE), P., 305.
- Methane, dichloro-, action of, with dipitylmethane** (LAVAUZ), A., i, 533.
- nitro-, condensation of aromatic aldehydes with** (REMPF), T., 232; P., 30.
- sodium derivative, action of phenyl carbimide on** (STEINKOPF and DAME), A., i, 280.
- Methanesulphyleic acid and its salts and derivatives** (CLEMMENSEN and HEITMAN), A., i, 542.
- Methanesulphonic acids, yttrium salts** (PRATT and JAMES), A., ii, 893.
- Methoxide, sodium, action of, on 7-nitrostilbene** (HIXM), A., i, 717.
- Methoxyacetophenone, α -amino-, hydrochloride** (MANNICH and HAHN), A., i, 649.
- 2,5-dihydroxy-, and its derivatives** (BARGELLINI and AURELI), A., i, 856.
- Methoxyacetophenone, 2,4-dihydroxy-, and its acetyl derivative** (BARGELLINI and AURELI), A., i, 856.
- Methoxy- β -aldehydiphenylacetic acid, methyl ester** (BISTRZYCKI and FELLMANN), A., i, 133.
- Methoxyamyltrimethylammonium iodide** (V. BRAUN), A., i, 612.
- Methoxy- α -anilylcinnamic acid** (STOERMER and FRIMMEL), A., i, 633.
- Methoxyanthraquinone monoxime** (FRIEDRICH and ACHENBACH), A., i, 70.
- β -chloro-** (FARRENFABRIKEN VORM. F. BAYER & Co.), A., i, 469.
- Methoxyanthraquinone, 1- and 3-amino-, nitro-, and iodo-** (BENSCH), A., i, 794.
- Methoxyanthraquinone, preparation of** (FARRENFABRIKEN VORM. F. BAYER & Co.), A., i, 469.
- 2-Methoxybenzaldehyde, 4-amino-** (BLANKMA), A., i, 62.
- 1- μ -Methoxybenzenesulphonic-chloronaphthalene and its acetyl derivatives** (CHARRIER and FERRERI), A., i, 1046.
- α - and μ -Methoxybenzenesulphonic- β -naphthal** (CHARRIER and FERRERI), A., i, 1046.
- α -Methoxybenzoic acid, dithio- (α -methoxyphenylcarbithioic acid), methyl ester of** (HOHN and BLOCH), A., i, 49.
- 4-Methoxybenzoic acid, 2-acetylmino-** (KALLE & Co.), A., i, 666.
- 4-Methoxybenzophenone, α - and μ -chloro-, α - and β -chloroimino-, α - and β -chloroimino- μ -chloro-** (PETERSON), A., i, 680.
- 5-Methoxybenzophenone, 2,4-di-hydroxy-** (BARGELLINI and MARTEDIANI), A., i, 986.
- 3-Methoxy-1,2-benzoquinone** (WILLSTATTKER and MÜLLER), A., i, 723.
- α -Methoxybenzoylbenzamidine** (TITNERLEY and HUGHES), T., 1506.
- 2- μ -Methoxybenzyl-1,3-dihydroisole and its salts** (TIFFENEAU), A., i, 810.
- α - μ -Methoxybenzyl- α -dimethylacetophenone** (HALLER and BAUER), A., i, 726.
- μ -Methoxybenzylidimethylamine and its salts** (TIFFENEAU), A., i, 779.
- α - μ -Methoxybenzylideneamino- α -methoxyphenylacetamide** (CLARKE and FRANCIS), T., 323.
- α - and μ -Methoxybenzylideneamino- α -phenylacetamide** (CLARKE and FRANCIS), T., 321.
- μ -Methoxybenzylidenehydantoin** (WHEELER, HOFFMAN, and JOHNSON), A., i, 923.
- μ -Methoxybenzylmethylamine and its hydrochloride** (TIFFENEAU), A., i, 779.
- Methoxyberberinum salts** (PYMAN), T., 1696; P., 215.
- Methoxycamphoroxalic acid, methyl ester** (TINGLZ and BATES), A., i, 54.
- β - α -Methoxycinnamide** (STONAMER, FRIDERICH, BRÄUTIGAM, and NECKEL), A., i, 296.
- m -Methoxycinnamic acid, methyl ester** (PONNER), A., i, 53.
- m -Methoxycinnamic acid, 4,6-dihydroxy-** (MOORE), T., 1016; P., 119.
- μ -Methoxycinnamic acid, sulphide of** (CURTIUS and KASTNER), A., i, 233.
- μ -Methoxyalloccinnamic acid and its derivatives** (STOERMER, FRIDERICH, BRÄUTIGAM, and NECKEL), A., i, 297.

- 2-Methoxydibenzyl, 4'-hydroxy- (STOERMER and FRIEMEL), A., i, 633.
- 4-Methoxydiethylphthalide and its mononitro-derivative (BAUER), A., i, 871.
- 3-Methoxydihydrobenzopyrone (TSCHITSCHIBABIN and NIKITIN), A., i, 1007.
- 7-Methoxy-3,4-dihydro-1,4-benzopyrone (TSCHITSCHIBABIN and NIKITIN), A., i, 1007.
- 2'-Methoxydiphenylacetamide, 4-hydroxy- (BISTRZYCKI, PAULUS, and PERRIN), A., i, 869.
- 2'-Methoxydiphenylacetic acid, 2-hydroxy-, lactone of (BISTRZYCKI, PAULUS, and PERRIN), A., i, 869.
- 4'-Methoxydiphenylacetic acid, 4-hydroxy- (BISTRZYCKI, PAULUS, and PERRIN), A., i, 868.
- 4'-Methoxydiphenylacetone, 4-hydroxy-, and its acetyl-derivative (BISTRZYCKI, PAULUS, and PERRIN), A., i, 868.
- 3,4-dihydroxy-, and its diacetate (BISTRZYCKI, PAULUS, and PERRIN), A., i, 868.
- a-Methoxy- α -3-diphenylethane, β -nitro-steroisomeric, preparation of (HEIM), A., i, 717.
- p-Methoxydiphenylphthalide (MEYER and FISCHER), A., i, 723.
- 2'-Methoxydiphenylsulphone 2-sulphinic acid (FRIES and VOGT), A., i, 557.
- 2'-Methoxydiphenylsulphone 2-sulphonic acid, and its amide (FRIES and VOGT), A., i, 557.
- 2'-Methoxydiphenylsulphone 2-sulphonyl chloride (FRIES and VOGT), A., i, 557.
- 3-Methoxy-1,4-diphenyl-1,2,4-triazolone (BUSCH and LIMPACH), A., i, 335.
- 2-Methoxy-4'-ethoxystilbene (STOERMER and FRIEMEL), A., i, 632.
- Methoxyl group, estimation of, in soils (SHOREY and LATHROP), A., ii, 327.
- 4-Methoxy-1-methylanthraquinone (FISCHER and SAPTER), A., i, 280.
- 3-Methoxy-5-methyl-2-trichloromethylphthalide (MELDRUM), T., 1716.

- 4-Methyl 1:6 dihydro-6-pyrimidin-2-thiol-β-hydroxyacrylic acid, ester (JOHNSON and SHEPARD), A., i, 925.
- 4-Methyl 1:6 dihydro-6-pyrimidin-2-thioloxalylacetic acid, diethyl ester and its thiocarbamide (JOHNSON and SHEPARD), A., i, 925.
- 13-Methyl 5:13 dihydroquinolin-2-one salts of (FICHTER and ROHNS), A., i, 86.
- 1-Methyldihydroquinoline, 6-nitro-2-hydroxy-, and its methyl and ethyl esters (DRECK, KAWOON, PFEIFFER, PROHATZKA, and A. C. I.), A., i, 1025.
- 2-Methyldihydroquinolinelyb- and sulphate and dibromide (HALL and SCHMEJA), A., i, 749.
- 6-Methyldihydroquinoline (HALL and SCHMEJA), A., i, 749.
- 8-Methyldihydroquinoline and its hydrochloride (HALL and SCHMEJA), A., i, 749.
- 2-Methyldiphenyl 2'-carboxylic acid, α-hydroxy-, and its lactone (KATZ and TURNER), T., 2113; P., 259.

1-Methyl-3-ethylcyclohexane and its nitrochloride (MAILHE and MURAT), A., i, 126.

2,1-Methyl-3-ethylidenecyclohexane and its derivatives (HAWORTH, PERKIN, and WALLACH), T., 127.

Methylethylmalonyl ethylmalonamide (REMPY), T., 618.

Methylethylmalonylmalonamide (REMPY), T., 618.

Methylethylmethylcarbinol (SAYTZEFF and UNANOFF), A., i, 415.

β -Methyl- γ -ethylpentane- β - γ diol (PARRY), T., 1171; P., 141.

d-Methylethylphenylphosphine oxide (MIZENHEIMER and LICHTENSTADT), A., i, 344.

$\beta\beta$ -Methylethylpropane $\alpha\alpha\gamma\gamma$ -tetracarbonylic acid, diimino-diimide and diimide of, and their derivatives (THOLE and THORPE), T., 441.

5-Methyl-2-ethyl-3-pyrazolidone, 1-nitroso- (MUCKERMANN), A., i, 815.

$\alpha\alpha$ -Methylethylsuccinic acid, synthesis and resolution of (INGLIS), T., 544; P., 46.

2-Methylfuran-3-carboxylic acid, ethyl ester (BENARY), A., i, 320.

Methylfurfuraldehyde, ω -bromo-, reactions of (COOPER and NUTTALL), T., 1193; P., 134.

hydroxy-, semicarbazone and p-bromophenylhydrazones of (BLANKSMAN), A., i, 75.

Methylgelatin (SKRAUP and BÖTTCHER), A., i, 247.

Methylglucosamine hydrochloride (LEVINE, McNICOLL, and HYND), T., 280; P., 23.

Methylglucoside, amino-, hydrobromide and hydrochloride (FISCHER and ZACH), A., i, 117.

β -Methyl-d-glucoside, tetrabenzoyl derivative of (FISCHER and HELFERICH), A., i, 803.

1-Methylglutaconic acid, cis- and trans-semianilides of (THOLE and THORPE), T., 2231.

(or 5)-Methylglyoxaline, derivatives of (EWING), T., 2052; P., 259.

4(or 5)-amino-, salts of (PYMAN), T., 2175.

and its salts and derivatives (WINDAUS and OPITZ), A., i, 752.

4(or 5)-chloro-, 4(or 5)-cyano-, 4(or 5)-hydroxy-, and their salts (PYMAN), T., 673; P., 91.

1-Methylglyoxaline-4-acetic acid and its ethyl ester and their picrates (PYMAN), T., 2180.

1-Methylglyoxaline-5-acetic acid and its picrate (PYMAN), T., 2181.

Methylglyoxalone, 4-amino-, derivatives of (FRANCKOWSKI and DUBSKY), A., i, 235.

α -Methylglyoxal- α oxime semicarbazones (BULOW and HANSEN), A., i, 244.

β -Methylheptan- β -dione and its semicarbazone (V. BAERYER and CHALLENGER), A., i, 901.

β -Methylheptan- α -one and its semicarbazone (V. BAERYER and CHALLENGER), A., i, 472.

β -Methyl- Δ^4 -hepten- β -dione and its semicarbazone (V. BAERYER and PICCARD), A., i, 901.

Methylheptenone, oxidation of (PRIESENHAFF), A., i, 244.

Methylheptylamina and its derivatives (BRAUN), A., i, 612.

d-Methyl-n-heptylcarbinol and its hydrogen phthalate and strychnine salts of the latter (KESYON), T., 60, 79.

Methylheptycyanamide (BRAUN), A., i, 611.

β -Methylhexane, nitro-derivatives of (COSTACHESCU), A., i, 104.

β -Methylhexane, $\beta\delta$ -dihydroxy-, (FISCH), A., i, 804.

1-Methylcyclohexane, 1,4-dibromo-, 1:2:4-tribromo- (PERKIN), T., 750.

1-Methylcyclohexane-2-carboxylic acid, trans-4-bromo-, 5-bromo-, 6-bromo-, and 3:4-dibromo-, and 1:2-dibromo- (PERKIN), T., 750.

d-1-Methylcyclohexane-3-carboxylic acid, 3:4-dibromo- (LUFKIN), T., 523.

1-Methylcyclohexane-4-carboxylic acid, cis- and trans- forms of, and their toluenidides (CHOU and PERKIN), T., 538.

d-1-Methylcyclohexane-4-carboxylic acid, 3-bromo-, and 3:4-dibromo- (CHOU and PERKIN), T., 534.

1-Methylcyclohexane-3:3-diacetic acid, $\alpha\alpha$ -dicyano-, derivatives of (L. ESCHI), A., i, 793.

$\alpha\beta$ -1-Methylcyclohexane-3:3-diacetic acid, $\alpha\beta$ -dicyano- (GUARASCINI), A., i, 793.

d-1-Methylcyclohexane-3-ol-4-carboxylic acid (CHOU and PERKIN), T., 534.

1-Methylcyclohexane-3-ol-3-acetic acid and its silver salt (H. PERKIN and WALLACH), T., 534.

1-Methylcyclohexane-2-one, 3-chloro-, and 3-hydroxy- (STEINHORST), A., i, 211.

1-Methylcyclohexane-3-one, and other derivatives of (MANN), A., i, 64.

- 1-Methylcyclohexan-3-one, 4-bromo-, 4-chloro-, and 4-hydroxy- (KÖTZ and STEINHORST, A., i, 211).
- 1-Methylcyclohexan-4-one, 3-bromo-, 4-bromo-, and 3-hydroxy- (KÖTZ and STEINHORST, A., i, 211).
- 1-Methylcyclohexan-3-one 6-carboxylic acid, ethyl ester (SKITA and PAUL, A., i, 442).
- 1-Methylcyclohexan-3-one- γ -ol and its semicarbazone (GAUTHIER, A., i, 415).
- 1-Methyl- Δ^2 -cyclohexene, 4-bromo- (PERKIN, T., 760).
- 1, 3- and 4-Methylcyclohexeneacetyl chlorides (DARZENS and ROST, A., i, 257).
- 1, 3- and *trans*-1-Methyl- Δ^2 -cyclohexene-2-carboxylic acid and their ethyl esters and 2,6-dibromo- (PERKIN, T., 760).
- Methyl- Δ^2 -cyclohexene-2-carboxylic acid and its ethyl ester (PERKIN, T., 764).
- Methyl- Δ^2 -cyclohexene-2-carboxylic acid and its ethyl ester (PERKIN, T., 764, P., 95).
- Methyl- Δ^2 -cyclohexene-2-carboxylic acid and its ethyl ester and 1,6-dibromo- (PERKIN, T., 738, P., 95).
- Methyl- Δ^2 -cyclohexene-3-carboxylic acid, resolution of, its optically active components and their ethyl esters (BOY and PERKIN, T., 521, P., 57).
- 1-Methyl- Δ^2 -cyclohexene-4-carboxylic acid and its ethyl ester (CHOU and PERKIN, T., 533, P., 57).
- Methyl- Δ^2 -cyclohexen-2-one and its semicarbazone (KÖTZ and STEINHORST, A., i, 211).
- Methyl- Δ^2 -cyclohexen-3-one and its semicarbazone (KÖTZ and STEINHORST, A., i, 211).
- Methyl- Δ^2 -cyclohexen-4-one and its semicarbazone (KÖTZ and STEINHORST, A., i, 211).
- 1-Methylcyclohexen-3-one 6-carboxylic acid, ethyl ester (SKITA and PAUL, A., i, 442).
- 1-Methyl- Δ^2 -cyclohexenylidenecetic acid, ethyl ester (AUWERS and EISENBERG, A., ii, 783).
- 1-Methyl- α -hexoamide (FARBEN-FABRIKEN VORM. F. BAYER & CO., A., i, 259).
- 1-Methylthioic acid, α -bromo-, and α -chloro-, guanicol esters of (FARBEN-FABRIKEN VORM. F. BAYER & CO., A., i, 630).
- 1-Methyl- α -thio-, and its ethyl ester (FARBEN-FABRIKEN VORM. F. BAYER & CO., A., i, 259).
- 1-Methylcyclohexyl 4-acetic acid, 4-bromo-, preparation of (PERKIN and POPE, T., 1513).
- dl*, *d*, *d*, and *l*-Methylcyclohexyl 4-acetic acids, α - and 8-4-dibromo- (PERKIN and POPE, T., 1518).
- 4-Methylcyclohexylacetyl chloride (DARZENS and ROST, A., i, 988).
- 1-Methylcyclohexylamine, ϵ -hydroxy-, and its succinate (WOLF and MAAG, A., i, 25).
- 1-Methylcyclohexylcarbinol, salts of (HITZIG, A., i, 222, P., 6).
- 1-Methylcyclohexylcarbinol, strychnine salt of the hydrogen phthalate of (PICKARD and KENYON, T., 61).
- 1-Methylcyclohexyl-4-chlorobromacetic acid, 4-chloro- (PERKIN and POPE, T., 1527).
- Methylcyclohexylhydroxine, derivatives of (MERKIN, A., i, 64).
- 1-Methylcyclohexylidene-4-acetic acid, molecular configuration of (EVERETT, P., 285).
- Optically active derivatives of (PERKIN and POPE, T., 1519, P., 212).
- dl* 1-Methylcyclohexylidene-4-acetic acid, rotatory power of (PERKIN and POPE, T., 1525).
- d* and *l* 1-Methylcyclohexylidene-4-bromacetic acid (PERKIN and POPE, T., 1524).
- Methylcyclohexylmethylcyclohexylidenehydrazine (MERKIN, A., i, 84).
- 4-Methylhydantoin, 2-thio- (WIKLER, NISSELI, and JOHNSON, A., i, 1022).
- 1-Methylhydantoinamide, 5-hydroxy- (BUTZ and POPE, A., i, 692).
- Methylhydrastine, oxiridine derivative, (RABE and McMILLAN, A., i, 77).
- 1-Methylhydrastinine hydrochloride (FARBEN-FABRIKEN VORM. F. BAYER & CO., A., i, 1915).
- N*-Methylhydrazobenzene (RASSOW and BECKER, A., i, 821).
- N*-Methylhydrazo-*o*-toluene (RASSOW and BECKER, A., i, 932).
- 3-[2-Methylhydrocoumarilyl]-4-methylcoumarin (FELS and VOLK, A., i, 203).
- 1-[2-Methylhydrocoumarilyl]-2-methylhydrocoumerone and its oxime (FRIGS and VOLK, A., i, 203).
- α -Methylhydrohydrastinine and its salts (FLEISCH and LEGERER, A., i, 906).
- 4-Methyl-2-hydroxy-1-aminethionaphthen, dibenzoyl derivative of (AUWERS and ARNDT, A., i, 588).
- Methylhydroxycamphor, nitro- (FORSYTH and WITHERS, P., 327).
- 1-Methyl-3- α -hydroxyethylcyclohexan-3-ol (HAWORTH, PERKIN, and WALLACH, T., 128).

- 3-Methyl-5-hydroxymethylbenzoic acid**, 2-hydroxy-, and its anhydride (ANILINFAABEN & EXTRAKT-FABRIKEN VORM. J. R. GEIGY), A., i, 978.
- 4 (or 5)-Methyl-5 (or 4)-hydroxymethylglyoxaline and its salts** (EWINS, T., 2055; P., 259).
- 6-Methyl-γ-hydroxy-ω-propyladipic acid** lactone of, and its ethyl ester (PERKINS, T.), 758.
- d,l-Methyl-3-α-hydroxy-ω-propyl-ω-hexan-3-ol** (HAWORTH, PERKINS, and WALLACH), T., 132.
- α-Methylindo-8-benzoylpropionic acid**, (MUMM and MÜNCHMEYER, A., i, 79).
- α-Methylindo-8-benzoylpropionitrile** (MUMM and MÜNCHMEYER, A., i, 79).
- Methyliminophthalanil** (KEISSER and HOLLE), A., i, 982.
- Methylindanthren** (FAABENFABRIKEN VORM. F. BAYER & CO.), A., i, 925.
- 2-Methylindole**, oxidation of (PLANCHER and COLACICCHI), A., i, 526.
- 4-nitro-1-hydroxy-**, and its methyl ether (BORSCHKE and RANTSCHKEFF), A., i, 332.
- 3-Methylindole**. See Scatole.
- 2-Methylindole-3-aldehyde** phenylhydrazine (KONIG), A., i, 809.
- 2-Methylindole-3-aldoxime** (KONIG), A., i, 809.
- 2-Methylindole-3-carboxylic acid**, 4-amino-, ethyl ester (BORSCHKE and RANTSCHKEFF), A., i, 332.
- 1-Methylisatin-2-anil** (PUMMERER and GRUBER), A., i, 231.
- Methylketen**, preparation of (SEAFDINGER, KLEVER, and MAYER), A., i, 307.
- Methyl ketones**, synthesis of (BARBIER and LOCQUIN), A., i, 708, 725.
- 2-Methyl-laurenone** (2:3:3:4-*t*-trimethyl-Δ¹-cyclopentenone-5), and its derivatives (LOCQUIN), A., i, 792.
- 1-Methyl-3-methenyl-1-cyclohexene** (AUWERS and EISENLOHR), A., ii, 782.
- 4 (or 5)-Methyl-5 (or 4)-methylamino-methylglyoxaline and its salts** (EWINS), T., 2058; P., 259.
- β-Methyl-ε-methylene-Δ²-hexinene-β-ol** (DUFONT), A., i, 174.
- 4-Methyl-ε-methylenequinone**, 3:5:6-tribromo- (ZINCKE and BREITWEISER), A., i, 216.
- Methylmorphimethine methyl ether**, salts of (KNORR and ROTH), A., i, 1015.
- Methylmorphinium methosulphite** (GERBER), A., i, 154.
- Methylmorphinium salts** A., i, 154.
- 1-Methylnaphthalene**, waxes (SACHS and BEIGEL), A., i, 7.
- Methylnaphthaphenazonium amide**, salts (KEMMANN and PUNTI, A., i, 925).
- Methylnarcotine methide** (McMILLAN), A., i, 75.
- Methylnarcotinim salts** A., i, 154.
- Methyl-α-nitro-ω-butyric acid** (KOFF and SUPAN), A., i, 71.
- 4-Methylnitrosoamino-3:3'-dimethyldiphenyl-4'-azo-8-naphthol** (KOFF and BECKER), A., i, 932.
- 4-Methylnitrosoamino-3:3'-dimethyldiphenyl-4'-diazonium** (KOFF and BECKER), A., i, 932.
- 4-Methylnitrosoaminodiphenyl-4'-azodimethylaniline and its salts** (KASSOW and BECKER), A., i, 932.
- 4-Methylnitrosoaminodiphenyl-4'-diazonium chloride** (KASSOW and BECKER), A., i, 921.
- Methyl-α-nonylcarbinol**, hydrochloride of (PICKARD and KENYON), T., 60, 70.
- d-Methyl-α-nonylcarbinol** and its benzene phthalate and benzene sulfonate salts of the latter (PICKARD and KENYON), T., 60, 70.
- Methylnorhemipinanzil**, 6-nitro-, acetyl derivative (WEGSCHEIDER and KLEMM), A., i, 542.
- Methylnorhemipin-1-anilic acid**, nitro-, and its salts and derivatives (WEGSCHEIDER and KLEMM), A., i, 541.
- Methylnorhemipin-2-anilic acid**, nitro- (WEGSCHEIDER and KLEMM), A., i, 541.
- Methylnorhemipinic acid**, dimethyl ester (WEGSCHEIDER and KLEMM), A., i, 542.
- d-Methyl-α-octylcarbinol** and its benzene phthalate and benzene sulfonate salts of the latter (PICKARD and KENYON), T., 60, 70.
- 5-Methylisoxazole**, synthesis of (CLAISEN), A., i, 491.
- 3-Methylisoxazole 4-azobenzene-4-azocyclic acid**, 5-hydroxy- (CLAISEN and HAAS), A., i, 349.
- γ-Methylisoxazalone and its derivatives** (OLIVERI-MANFROTTO and COPPOLA), A., i, 492.
- 1-Methylindole-3-aldehyde** and its derivatives (FRIEDLANDER and BASINSKI), A., i, 1022.
- h-o-Methylcinnamic acid**, ethyl ester (STORMER, FRIDERICI, BRUNNEN and NECKEL), A., i, 297.

- Methyl- α -pentadecylcarbinol and its salts (PICKARD and KENYON), P., 313.
- Methyl- α -pentadecyl ketone and its semicarbazone (PICKARD and KENYON), P., 313.
- 1 Methyl Δ^2 -pentadiene (KILNER and KRAWKOWSKOFF), A., i, 635.
- 2 Methylpentan-3 α -diol and its derivatives (BOUYEAULT and LOUQUIN), A., i, 250.
- 3 Methylpentan-3 β -diol (UMNOVA), A., i, 250.
- 4 Methylpentane-3 α -dibromo- (KILNER and KRAWKOWSKOFF), A., i, 635.
- 5 Methylpentan-3 α -ol (UMNOVA), A., i, 250.
- 1 Methylpentane-3 carboxylic acid, ethyl ester, and its ethyl ester (HORE and PERKINS), T., 771.
- 2 Methylpentan-4-ol-2 carboxylic acid and its ethyl ester (HORE and PERKINS), T., 770.
- 3 Methylpentan-7-ol-3 one *disaccharide* (HORE and PERKINS), T., 774.
- 4 Methylpentan-3 one, catalytic reduction (ZEJINSKY), A., i, 988.
- 1 Methylpentan-2-ono-4 carboxylic acid and its ethyl ester and derivatives (HORE and PERKINS), T., 774.
- Methylpentan-4-ono-2 carboxylic acid and its ethyl ester and derivatives (HORE and PERKINS), T., 769.
- Methylpentan-2-ono-3,4 dicarboxylic acid, ethyl ester (HORE and PERKINS), T., 774.
- Methylpentan-4-ono-2,3- or 2,5 dicarboxylic acid, ethyl ester, and its semicarbazone (HORE and PERKINS), T., 768.
- Methylpentan-7-ono-3 α -ol (GUTHRIE), A., i, 313.
- Methylpentanone-7-ol (GUTHRIE), A., i, 313.
- ethylpentosane, estimation of, in yeasts and in wood fungi (SHIDA and TOLLINS), A., ii, 645.
- ethylphenolphosphorhido (WILLIAMS and SMITH), A., i, 113.
- Methylphenanthrene, and 1 hydroxy-, and its acetyl derivative (BEHREND and KUNIKHAUD), A., i, 291.
- Methylphenothioxin (AKHIEV GSEIL-SHAFI FOR ANILIN-FABRIKATION), A., i, 903.
- Methyl 4- α -propyl 3-allyl- Δ^2 -cyclohexan-3-ol, oxidation of, and halogen derivatives (SANTZEFF), A., i, 474.
- Methyl 5-propyl-3-allyl- Δ^2 -cyclohexen-3-ol (MATSCHKEVITSCH), A., i, 962.
- Methyl 5- α -propyl-3-allyl- Δ^2 -cyclohexen-3-ol (MATSCHKEVITSCH), A., i, 962.
- Methyl- α -propylcarbinol, hydrogen succinate of (PICKARD and KENYON), T., 319.
- 4 Methyl- α -propylcarbinol, and its hydrogen phthalate and bromine and sterylamine salts of the latter (PICKARD and KENYON), T., 60, 65.
- Methyl- α -propylcarbinol, rotation of (PICKARD and KENYON), P., 324.
- 3 Methyl- γ -propylhexan-8 γ -diol (PARRY), T., 1171, P., 141.
- 1 Methyl 3-propyl- Δ^2 -hexane (MATHIE and MURAT), A., i, 126.
- 1 Methyl 3-propyl- Δ^2 -hexan-3-ol, derivatives of (MATHIE and MURAT), A., i, 126.
- 1 Methyl-3- α -propyl- Δ^2 -hexan-2-ol (WALLACH and VIERCK), A., i, 313.
- 1 Methyl 2- α -propyl- Δ^2 -hexan-5-one and its oxime and benzylidene derivative (KOTZ and ANGER), A., i, 310.
- 1 Methyl 3- α -propyl- Δ^2 -hexan-3 one (WALLACH and VIERCK), A., i, 313.
- 1 Methyl 3-propyl- Δ^2 -hexene and its nitroacetaldehyde (MATHIE and MURAT), A., i, 126.
- 1 Methyl 3-propyl- Δ^2 -cyclohexen-3-one (MATSCHKEVITSCH), A., i, 962.
- 1 Methyl 3- α -propyl- Δ^2 -pentan-1-ol (WALLACH and GILDEMEIER), A., i, 311.
- 1 Methyl 3- α -propyl- Δ^2 -cyclopentane and its derivatives (WALLACH), A., i, 310.
- 1-Methyl 3- α -propyl- Δ^2 -pentylmethylamine and its derivatives (WALLACH and GILDEMEIER), A., i, 311.
- 3 Methylpyrazole-4 azobenzene 4'-*p*-asosalicylic acid, 5-hydroxy (BROWN and HANSEN), A., i, 339.
- 5 Methyl 3-pyrazolidone, 1 nitroso-, and its salts (MICKERMANN), A., i, 814.
- 3 Methyl 3-pyrazolone, 4-bromo-, and 4,4-dibromo- (MICKERMANN), A., i, 815.
- 5 Methylpyridazin-6-ono-3 carboxylic acid (BLAIS and GATTE), A., i, 520.
- 1-Methyl 2-pyridone, 3-bromo-, and 3,5-dibromo- (DECKER, KAUFMANN, SASSER and WISLOCKI), A., i, 1024.
- 3-Methyl- α -pyrone, 6-chloro-, and 6-hydroxy (THOLE and THORPE), T., 2223.
- 2-Methylpyrrole 3 carboxylic acid, ethyl ester (BENARY), A., i, 319.
- 4-Methyl 5-pyrrolidone, 2 imino-4-cyano-4-cyano- (THOLE and THORPE), T., 1657.
- Methylquinolanol, dinitro-, and its derivatives (KAUFMANN and STRUBIN), A., i, 321.
- Methylquinoline oxide, dinitro- (KAUFMANN and STRUBIN), A., i, 323.

- 2-Methylquinoline (*quinaldine*), mechanism of the synthesis of (JONES and EVANS), T., 334; P., 43.
- 3-Methylquinoline and its salts (v. JAKUBOWSKI), A., i, 82.
- 6-Methylquinoline 8-carboxylic acid and its salts (v. JAKUBOWSKI), A., i, 81.
- 2-Methyl-6-quinolinium picrate (DECKER and KAUFMANN), A., i, 1023.
- meri-Methylquinonedi-imonium bromide (PICCARD), A., i, 569.
- Methyl-red and its salts and derivatives (HOWARD and POPE), T., 1333; P., 206.
- Methylis-spartaine and its picrate and methiodide (MOURET and VALEUR), A., i, 319, 562.
- Methylis-lanceolic acid, condensation of its naphthaldehyde with (BEHREND and KLINCKHARD), A., i, 291.
- Methylsulphonie acid, yttrium salt (PIATTI and JAMES), A., ii, 893.
- 2-Methyltetrahydroquinoline (*tetrahydroquinaldine*), *d*- and *l*-, physiological action of (DALE and MILES), A., ii, 636.
- 2-Methyltetrahydrothiophen and its derivatives (v. BRAUN), A., i, 75.
- 4-Methyl-2-tetrahydro-2'-thio-6'-pyrimidone (thio-1:6 dihydro-6 pyrimidone) (JOHNSON and SHEPARD), A., i, 925.
- 1-Methyltetrone-4 carboxylic acid, methyl ester (BENARY), A., i, 673.
- Methyltetronic acid (BENARY), A., i, 673.
- Methylthecanium salts (GREER), A., i, 154.
- N-Methylthiodiphenylamine-2:7-dipthaloylo acid (SCHOLL, SEKE, and TRITACH), A., i, 558.
- m*-Methylthiohydantoic acid and its barium salt (KOMATSU), A., i, 684.
- 2- and 5-Methylthiohydantoin (KOMATSU), A., i, 684.
- 1-Methylthiolbenzene, 4-iodo- and its derivatives (ZINCKE and JÖRG), A., i, 40.

- p*-Methylthiolbenzonitrile (ZINCKE and JÖRG), A., i, 40.
- 3-Methylthiolbenzyl acetate, 2,5-dibromo-4-hydroxy-, and its diacetyl derivative (ZINCKE, FROHNEBERG, and KEMPF), A., i, 440.
- 3-Methylthiolbenzyl alcohol, 2,5-dibromo-4-hydroxy-, and its methyl ester (ZINCKE, FROHNEBERG, and KEMPF), A., i, 440.
- 5-Methylthiol-*o*-cresol, 3-bromo-, 4-bromo-, and 3-nitro-, and its derivatives (ZINCKE and BREUER), A., i, 195.
- 3-Methylthiol-*p*-cresol, 5-bromo-, 2,5-dibromo-, and their derivatives (ZINCKE and KEMPF), A., i, 195.
- 2,5-Dibromo-, 4-bromo-, and its derivatives (ZINCKE, FROHNEBERG, and KEMPF), A., i, 440.
- 4-Methylthioldiphenylamine, 2-amino-, and 2:4-dinitro- (JÖRG), A., i, 40.
- 2-Methylthiol-1-phenyl-4-benzylhydantoin (WHEELER and LECHT), A., i, 500.
- 5-Methylthiol-1-phenyl-3-methyl-4-ole (4-thiopyrine), amino-, and phenylhydrazones (v. GERING and BOELKE), A., i, 439.
- 4-Methylthionaphthoquinone, 2-amino-, and phenylhydrazones (v. GERING and BOELKE), A., i, 439.
- 4-Methylthionaphthoquinone, 2-amino-, and phenylhydrazones (v. GERING and BOELKE), A., i, 439.
- 5-Methylthiophen-2-aldehyde and its derivatives (GRISHKEWITSCH and OWSKY), A., i, 806.
- 5-Methylthioxanthone, 2-amino-, and its derivatives (CHRISTOPHER and SMITH), A., i, 739.
- 7-Methylthioxanthone, 2-amino-, 2-hydroxy-, 4-hydroxy-, and its derivatives (SMILES), T., 2019.
- 2:3:4-trihydroxy-, and its derivatives (ÜLLMANN and SMILES), T., 739.
- N-Methyl-*o*-tolidine and its derivatives (RASSOW and BEHREND), A., i, 932.
- 8-Methyl- γ -*p*-tolylhexane- γ -ol (v. GERING and BOELKE), A., i, 291.
- Methyl-*n*-tridecylcarbinol and its derivatives (PICCARD and KENYON), T., 60.
- Methyl-*n*-tridecyl ketone and its derivatives (PICCARD and KENYON), T., 312.
- Methyl-*n*-undecylcarbinol (PICCARD and KENYON), T., 58.
- d*-Methyl-*n*-undecylcarbinol and its hydrogen phthalate and strychnine salts of the latter (PICCARD and KENYON), T., 60.
- Methyl-*n*-undecylcarbinol, oxidation and derivatives of (BEHREND and SERVIER), A., i, 158.
- 3- and 7-Methyluric acid, oxidation in the presence of ammonia (v. GERING and BOELKE), A., i, 691.
- α -Methylvaleric acid, dibromo- (v. GERING and KLAWIKORDOFF), A., i, 440.
- Methylvinylcarbinol (FARRENFORTH, F. BAYER & Co.), A., i, 150.

- Microchemical studies** (BOLLAND), A., ii, 151.
- Microclasia**, distinction between ortho- and VERNADSKY and REVUTSKY, A., ii, 122; (BARBIER), A., ii, 735.
- Micro filter** (KREIM), A., ii, 225.
- Micro organisms**, resistance of, to disinfectants (HAUSER), A., ii, 1021.
- Micro-polarisation**. See under Photography.
- "Migraine"**, estimation of antipyrine (SIEFENWYK), A., ii, 80.
- Milk**, specific gravity of small quantities of (KREIM and LENK), A., ii, 947.
- , signal acidity of (BORDAS and TOURNAI), A., ii, 631.
- , acid from sterilised (AWERKIEFF), A., ii, 151.
- , of ammonium acetate and asparagine in production of (MORGEN, BRYTE, and WESTHAUSSEN), A., ii, 151.
- , order of oxidation of (JONA), A., ii, 233.
- , proteins of (BAUER and ENGEL), A., ii, 307.
- , fermentation of citric acid in (BOSWORTH and PERCHA), A., ii, 318.
- , setting of, by rennet (BANG), A., ii, 826.
- , cooled and boiled, behaviour of, towards rennet and acid (KREIM and LENK), A., ii, 1114.
- , casease of (SPINDLER), A., ii, 133.
- , effect of deficiency of calcium and phosphorus on the secretion of (FISCHER), A., ii, 510.
- , changes produced in, by bacteria (SCHÖNBERG and WATTS), A., ii, 542.
- , cows', distinction between fresh and boiled (NICHOLAS), A., ii, 556.
- , effect of heat on the peroxylase of (VAN ECK), A., ii, 1144.
- , variation in the composition of (CROWTHER and RUSTON), A., ii, 510.
- , response of, to the Scharlinger reaction (REINHARDT and SEIBOLD), A., ii, 307, 418.
- , human, composition of, in nephritis (ENGEL and MERSCHHAUSEN), A., ii, 813.
- , Scharlinger's reaction for (RUELMANN), A., ii, 687; (FÜRST and SCHMID), A., ii, 1115.
- , cause of coloration of, with Rothenfusser's reagent (HESSE and KOOPER), A., ii, 592.
- , peroxylase reaction of (GRIMMER), A., ii, 936.
- Milk**, estimation of citric acid in (DESMOUTIERE), A., ii, 548.
- , estimation of fat in (JONA), A., ii, 234; (GERKE), A., ii, 943.
- , estimation of lactose in (VITTOUX), A., ii, 74; (JONA), A., ii, 234.
- , estimation of nitrates in (TILLMANN and SPILLERGER), A., ii, 1132.
- , detection and estimation of nitric acid in (TILLMANN), A., ii, 151.
- , estimation of phosphorus in the ash of (BORDAS and TOURNAI), A., ii, 438, 535; (FLEURENT and LEVI), A., ii, 535.
- , estimation of proteins in (RICHMOND), A., ii, 236.
- , influence of potassium dichromate on the analytical constants of (GARNIER), A., ii, 161.
- Mineral**, new, from Brazil (PADUA e CASANOVA), A., ii, 735.
- , waters. See under Water.
- Minerals**, formation of, during sintering (JESSER), A., ii, 500.
- , association of lead with uranium in, and the measurement of geological time (HOMES), A., ii, 570.
- , ratio of lead to uranium in, and its application to measurement of geological time (ZAMBINI), A., ii, 659.
- , application of the phase rule to associations of (GOLDSCHMIDT), A., ii, 991.
- , action of cathode rays on (POCHI-NETTO), A., ii, 357.
- , coloration of, by cathode rays (DOKL-IPPE), A., ii, 569.
- , variation of the refractive index of, with temperature (LIEBRICH), A., ii, 165.
- , melting points of (DAY and SOMMAN), A., ii, 496.
- , specific heats of, at high temperatures (HASCHINSKY), A., ii, 253.
- , solid solution in (FOOTE and BRADLEY), A., ii, 122.
- , chemical effects of pressure in (SPEZIA), A., ii, 993.
- , containing aluminium silicate in soils (VAN DER LEEUW), A., ii, 299.
- , containing helium, composition of (LANGER), A., ii, 499.
- , from Arizona and California, crystallography of (GUILD), A., ii, 802.
- , from the mine of Calabona (SERRA), A., ii, 294.
- , from Hungary, analysis of (v. KALECSINSZKY), A., ii, 47.
- , containing lead and zinc from Kansas, Missouri (ROGERS), A., ii, 800.
- , Mexican (UNGEMACH), A., ii, 614.
- , of the olivine group (BACKLUND), A., ii, 616.

- Minerals**, Trans-Baikal (KUNNETZOFF), A., ii, 1104.
 platiniferous, of the Urals (DUPARC), A., ii, 733.
 of Ytterby, Sweden (NORDENSKJÖLD), A., ii, 296.
 radioactive. See under Photochemistry.
 detection of, by colour reactions (GAILBERT), A., ii, 337.
 estimation of radium in (JOLY), A., ii, 685.
 estimation of free sulphur in (LEVY-W.), A., ii, 1130.

- influence of adrenaline on the activity of (RUDOWSKA), A., ii, 312.
- action of caffeine on (BASSON), A., ii, 114.
- action of nicotine on encephalised (BURKHARDT), A., ii, 750.
- effect of potassium salts on (MATHISON), A., ii, 753.
- effect of yohimbine, veratrine, and protoveratrine on (WALLER), A., ii, 138.
- changes in, after nephrectomy and unilateral ligation (JACKSON), A., ii, 199.
- extractive of (A. GULEWITSCH), A., i, 815.
- extractives of, distribution of nitrogen in the (A. FLETH and SCHWARZ), A., ii, 216.
- protein metabolism in (SCALFIDDI), A., ii, 216.
- plasma and pancreatic extract, action of, on sugars (LWENSE and MEYER), A., ii, 914.
- bronchial, action of drugs on (JANUSCHKE and POLLAK), A., ii, 1120.
- cardiac, action of lactic acid on (BURKHARDT), A., ii, 750.
- frog's, action of salts on the excitability of (JENSEN and MELTZER), A., ii, 55.
- effect of potassium salts on (BURKHARDT), A., ii, 628.
- surviving, influence of substances on the gaseous exchange of (THUNBERG), A., ii, 627.
- isolated, action of salts on (WARD), A., ii, 906.

- Muscle, living, reactions between chemical compounds and the proteins of** (VELEY), T., 160; P., 3.
skeletal, action of acids on (DALE and MINEA), A., ii, 629.
striated, action of veratrine on (LAMM), A., ii, 813.
Muscular rigor and protein coagulation, the relation between (ROSSI), A., ii, 812.
Muscular work, effect of, on the decomposition of injected sugar (HOUWZU), A., ii, 127.
relation of, to k-tone formation (PRETI), A., ii, 628.
effect of, on protein metabolism (TUGLIESE), A., ii, 624.
Mushroom, constituents of extract of (KUTSCHER), A., ii, 528.
Mithmannite (ZAMBONINI), A., ii, 734; (GIARTALDI), A., ii, 901.
 α - and β -Myketosine (HONDA), A., i, 807.
Myrica Gale, constituents of the oil of (PICKER), T., 1764; P., 220.
Myricetin and its hexamethyl ether (PERKIN), T., 1721; P., 225.
Myristic acid, ammonium salt (FALCLOA), A., i, 175.
Myristicinic acid, amino-, cyano-, and their ethyl esters and nitro-ethyl ester (SALWAY), T., 268.
nitro-, orientation of the nitro-group in (SALWAY), T., 266; P., 20.

N.

- Naphthacenequinone, 6-chloro-1-hydroxy-, and its sodium salt** (ANILINFARBEN & EXTRACT-FABRIKEN VORM. J. R. GEIGY), A., i, 137.
Naphthacenequinone-4 sulphonic acid, 6-chloro-1-hydroxy-, and its sodium salts (ANILINFARBEN & EXTRACT-FABRIKEN VORM. J. R. GEIGY), A., i, 137.
Naphthacetic acid (HOUBEN and DOESCHER), A., i, 61.
Naphthaldehyde, 2-chloro-, and its derivatives (SACHS and BRIGL), A., i, 720.
2-Naphthaldehyde, condensation of, with methylsuccinic acid (BEUREND and KLINCKHARD), A., i, 294.
2-Naphthaldehyde, 4-bromo-1-hydroxy-, 4-chloro-1-hydroxy-, and their derivatives (WEIL and HEERDT), A., i, 979.
Naphthalene, constitution and ultraviolet absorption spectrum of (FRY), A., i, 481.
Naphthalene, preparation of, and its derivatives of (KALLE), A., ii, 627.
Naphthalene, 2,4-dibromo-, 2,4-dibromo-1,5-dichloro-, and tribromo-, and their derivatives (WOLFFLEBEN), A., i, 556.
1,4-, and 1,5-dichloro-, and their derivatives of (BADISCHE ANILIN- & SODA-FABRIK), A., i, 556.
1,4-dihydroxy-, methyl-, and their derivatives of (WERKE VORM. MEYER, A. & CO.), A., i, 551.
2,3-dihydroxy-, compounds of, and p-benzoquinone (SILVERMAN), A., i, 854.
2,4-dinitro-, and 2,6-dinitro-, compounds of, phenyl-, and their derivatives of (BOROUGH and BEAN), A., i, 5.
Naphthalene ring, 4-phenyl-, and its derivatives of, in the animal body (KIRK), A., i, 551.
Naphthalene series, ring of, and its derivatives of (SACHS and BRIGL), A., i, 720.
4- β -Naphthaleneazo-5-hydroxy-3-methylisoxazole (BURTON and HECKING), A., i, 245.
4- α - and β -Naphthaleneazo-5-hydroxy-3-methylpyrazole (BURTON and HECKING), A., i, 405.
4- α - and β -Naphthaleneazo-5-hydroxy-phenyl-3-methylpyrazole (BURTON and HECKING), A., i, 405.
Naphthalene-4-azo-1,2-methylene-diphenyl-, and its derivatives of, benzene, α -amino-, and its derivatives of (MAYER), A., i, 1046.
1-Naphthaleneazo- β -naphthol (CHARRIER and FERRIER), A., i, 1046.
1-Naphthaleneazo-2'-naphthylamino-chloro- (CHARRIER and FERRIER), A., i, 1046.
4- α - and β -Naphthaleneazo-3-phenyl-oxazolone (MEYER), A., i, 1046.
Naphthalene-1-diazo-2-oxide-4-sulphonic acid, bromo-, and its derivatives of (CHEMISCHE FABRIKEN VORM. SACHS and BRIGL), A., i, 1047.
Naphthalene-3-sulphonic acid, 6-chloro-, preparation of, and its derivatives of (ANILIN- & SODA-FABRIK), A., i, 1047.
Naphthalene-6-sulphonic acid, 1-chloro-, and its derivatives of (BADISCHE ANILIN- & SODA-FABRIK), A., i, 434.
 α -, and β -Naphthalenesulphonyl-glycine (ALVERN and WELLS), A., i, 87.
 β -Naphthalenesulphonyl- β -3-amino-butyric acid (FISCHER and SCHNEIDER), A., i, 527.
 β -Naphthalenesulphonylamino-glycine (HOPWOOD and WELLS), A., i, 573.

- Excitability of, in oxalic acid poisoning** (CHART and FROHLICH), A., ii, 1018.
- Polarised, effect of ions transported by the current, on the conductivity of** (SCHWARTZ), A., ii, 306.
- Nervous system**, chemical composition of the (BARRIER), A., ii, 413.
- Staining of the tissues of the** (SMITH and MAIR), A., ii, 215.
- Vegetative, changes in the excitability of the, by removal of calcium** (CHART and FROHLICH), A., ii, 306.
- Neushonite**, artificial production of (CESARO), A., ii, 209.
- Neuro-muscular mechanisms**, replacement of the alkaline-earth metals in (MINES), A., ii, 413.
- Nickel**, electrolytic deposition of (ENGMANN), A., ii, 1094.
- Anodic polarisation of, in presence of bromous salts** (RUSSE), A., ii, 1056.
- Anode.** See under Electrochemistry.
- Passive, influence of the magnetic field on** (BELL and MORGAN), A., ii, 1067.
- Reactions in the presence of** (SKOU and ADRIAN), A., ii, 107.
- Hydrogenation by, in presence of sodium hypophosphite** (BREKKE), A., ii, 1033.
- Catalysis with finely divided** (VAN BERGELEN), A., ii, 761.
- Sodium chloride and mercury, reactions in the system** (FRIEDS), A., ii, 1095.
- Solubility of hydrogen in** (SIEVERIS), A., ii, 895.
- Complex compounds of, with glyoximes** (TSHIRGLEY), A., ii, 263.
- Nickel alloys with molybdenum** (BAER), A., ii, 611.
- With zinc** (VINCIGUERRA and BOURNON), A., ii, 1095.
- Nickel salts**, absorption of light by (HOFMANN), A., ii, 785; (HOFMANN and ANDERSON), A., ii, 786.
- Magnetisation of** (WEISS and FORAY), A., ii, 183.
- Nickel carbonyl**, magnetic susceptibility of (ONDA), A., ii, 251.
- Tetrahydronickel** (COSTACHESCU), A., ii, 739.
- Hydroxide, use of, in tannin estimation** (SINGH), A., ii, 946.
- Peroxide, behaviour of, in salt formation** (TIBBAND and RIEGEL), A., ii, 987.
- Nickel**, distinction between, and cobalt (WEISS), A., ii, 158.
- and cobalt**, borax bead tests for (CURRYMAN and ROURENO), A., ii, 336.
- Spongy, precipitation of** (LOW), A., ii, 1139.
- Precipitation of, as carbonate** (SCHIRM), A., ii, 1138.
- Estimation of, electrolytically** (BENNER and ROSS), A., ii, 143.
- Estimation of, and cobalt gravimetrically** (FRIED), A., ii, 1034.
- Copper and cobalt, estimation of** (PETERSON), A., ii, 771.
- Estimation of, in German silver** (HOFMANN), A., ii, 1139.
- Rapid estimation of, in steel** (RAUFIN), A., ii, 1034.

- Nickel steel** (McWILLIAM and BARNES), A., ii, 1092.
 cementation of (GIOLITTI and CAENEVALI), A., ii, 609.
 magnetic properties of (COLVER, GLAUERT and HILPERT), A., ii, 1057.
 anomalous expansion of (GUILLAUME), A., ii, 185.
- Nicotine**, action of, on curarised muscle (BURRIDGE), A., ii, 750.
 hydrochloride, double salt of, with antimony pentachloride (THOMSEN), A., i, 484.
- Nicotine**, estimation of (BERTRAND and JAVILLIER), A., ii, 827.
 estimation of, in tobacco (ESNER; TÖTH), A., ii, 943.
 estimation of, in tobacco-juice (SCHRODER), A., ii, 163, 552; (KISLING), A., ii, 344, 345; (ULEX), A., ii, 344; (TORN; LEISTER), A., ii, 345; (v. DEGRAZIA), A., ii, 671; (MELLER), A., ii, 672; (KOENIG), A., ii, 672, 1143.
 estimation of, in presence of pyridine bases (SURKE), A., ii, 778.
- Nicotinic acid**, betaine of (KIRPAL), A., i, 157.
- isNicotinic acid**, betaine of (KIRPAL), A., i, 156.
- Niton**. See Radium emanation.
- Nitrilic acid**. See *p*-Benz²quinone. 3:6-dinitro-2:5-dihydroxy.
- Nitrates**. See under Nitrogen.
- Nitratochlorine perchlorate** (HOFMANN and HOBOLD), A., i, 608.
- Nitre**, assay of sweet spirits of (HERRING; DIETZ), A., ii, 662.
- Nitric acid**. See under Nitrogen.
- Nitrification** by ultra-violet light (BERTHELOT and GAUDECHON), A., ii, 240.
 action of gypsum on (DEZANI), A., ii, 1019.
- Nitriles**, synthesis of (GRIGNARD), A., i, 292.
 action of, on cyanoguanidine (OSTROGOVICH), A., ii, 507.
 action of hydrogen chloride and methyl alcohol on (STEINKOFF and MALINOWSKI), A., i, 946.
 toxicity of (DESGREZ), A., ii, 1119.
- Nitrilo-trimethylnitroaminomethane** (FRANCHIMONT), A., i, 19.
- Nitroamines**, aromatic, action of concentrated sulphuric acid on (REVERDIN), A., i, 123.
 and allied substances, transformation of, and its relation to substitution in benzene derivatives (BRITISH ASSOCIATION REPORTS), A., i, 713.
- Nitro compounds**, ultra-violet spectra of (ZELINSKY and ZELINSKY), A., ii, 1044.
 freezing-point curves of, with fluorene (KREMMANN, DORFER, FRANKOVIC, HÖNEL, SCHÖTZ, and ...), A., ii, 871.
 condensation of cotarnine (and ROBINSON), T., 211.
 aliphatic (STEINKOFF and ...), i, 4, 946; (STEINKOFF and ...), A., i, 290; (STEINKOFF and ...), A., i, 530.
 primary aliphatic, preparation of (v. BRAUN and SOBERN), A., ii, aromatic (CIUSA), A., i, 941.
 colorations produced by the action of amino-compounds (WALTER), A., i, 363.
- Nitrogen** and sulphur, relative atomic weights of (BURI and USHER), ii, 339.
 pure, industrial preparation (CLAUDE), A., ii, 1044.
 spectrum of (FOWLER and ...), A., ii, 678.
 a chemically active form of, produced by the electric discharge (STEINKOFF), A., ii, 452.
 flame from the electric arc (STEINKOFF), A., ii, 1056.
 quinquevalent, stereochemistry (SCHOLTZ), A., i, 326.
 ratio of, to argon in natural gas mixtures (MOTREU and ...), A., ii, 602.
 and carbon, gaseous compounds (LIDOFF), A., i, 429.
 and hydrogen, compounds of, lithium (DAFERT and ...), A., ii, 393.
 action of, on lithium carbide (TAN and MOODY), A., ii, 883.
 non-combination of, with hydrogen in the presence of nickel (NEUBAUER and ...), A., ii, 107.
 and oxygen, analogies between derivatives of (ANGELI), A., ii, catalytic action of potassium on the absorption of, by lithium carbide (POLLACK), A., i, 53.
 action of, on wines (MALVERN), ii, 916.
 compounds, assimilation of (LIEBISCH), A., ii, 523.
 assimilation of, by leaves (GRASS and KOOPER), A., ii, 524.
 atmospheric, assimilation of, by plants (MAMELI and ...), A., ii, 759; (HUTCHINGS and MILLER), A., ii, 920.

Nitrogen. atmospheric, assimilation of, by thermophilic bacteria (PRINGSHEIM, A., ii, 916).
 detection of, by fungi (LIPMAN), A., ii, 919.
 metabolism. See under Metabolism.
 reduction of *Leguminosae* (RITTER), A., ii, 428.
 reaction in soils, chemical nature of (MORSE), A., ii, 821.
 availability of (LIPMAN, BROWN, and FLOWEN), A., ii, 924.
 effect of rain-water in Tompkin (ALFORD), A., ii, 224.
Nitrogen hydrides, behaviour of, with oil ammonia (BLOWNE and WILSON), A., ii, 1084; (BLOWNE and BOUTERHAN), A., ii, 1085.
 formation of, during denitrification (STUART), A., ii, 916; (FISCHOFF), A., ii, 917.
 reduction of, in the presence of nickel (NORD and ABRIKORF), A., ii, 657.
Nitrogen monoxide (nitrous oxide), preparation of (QUARTARONE), A., ii, 1085.
 the system nitric acid, nitrous acid and, equilibrium in (LEWIS and FISHER), A., ii, 264.
 a crystal of SMITH and LIPMAN, A., ii, 766.
Nitrogen dioxide, nitric oxide, preparation and estimation of, and its behaviour to water (MOSER), A., ii, 428.
 analysis (REIS), A., ii, 458.
 density curve of, and methyl ether (BUTLER and GERMANN), A., i, 830.
 sulphate, crystalline form of (SMITH), A., ii, 1086.
Nitric acid, formation of, in the arc discharge (MAKOWITZKY), A., ii, 453.
 molecular weight and constitution of (ROSS and ANELLI), A., ii, 717.
 the system, nitrous acid and nitric oxide, equilibrium in (LEWIS and FISHER), A., ii, 264.
 action of nascent hydrogen on (BANKOFF and BANKOFF), P., 326.
 decomposition of, by light (RAYNOLD and TAYLOR), P., 366.
 oxidation of organic acids by, in sunlight (BENRATH), A., ii, 835.
 presence of metallic nitrates on the reduction of copper in (KYNIG and COOKE), T., 1035; P., 42.
 influence of ferric salts and of manganese nitrate on the rate of reduction of mercury in (RAY, T., 1912; P., 4.

Nitrogen

Nitric acid, detection of (KERN, A., ii, 341).
 detection and estimation of, in milk (TILLMANN), A., ii, 151.
 estimation of (ROMAN), A., ii, 767.
 estimation of, in wines (TILLMANN), A., ii, 930.
Nitrates, production of, in arable soils (KERN), A., ii, 822.
 reduction of, by bacteria (PELZ), A., ii, 139.
 reduction of, by perhydrazine (BAER), A., ii, 759.
 reaction between anhydrous formic acid and (QUARTARONE), A., ii, 1079.
 fusion of, with sodium paratungstate (GOUGH and KIZILIAN), A., ii, 657.
 detection of, by the diphenylamine test (WIDERS and RAY), A., ii, 656; (CARON), A., ii, 767.
 detection of, in water (DENIGES), A., ii, 655.
 detection and estimation of, in water (TILLMANN and SUTTHOFF), A., ii, 767.
 estimation of (CARON and RAQUET), A., ii, 69; (MARCKYNOV and FROSTEN), A., ii, 437; (QUARTARONE), A., ii, 1085; (SEYDEL and WIDERS), A., ii, 1132.
 estimation of, in gum-cotton (PELZ), A., ii, 930.
 estimation of, in milk (TILLMANN and SUTTHOFF), A., ii, 1132.
 estimation of, of gonometrically, sources of error in the (RUFF and GERTEN), A., ii, 930.
 estimation of, in water, by the phenylsulphonic acid method (CHAMOT, PRAET, and KEDFIELD), A., ii, 331.
 estimation of, in vegetable matter (KROG and SEYDEL), A., ii, 227.
Nitrous acid, formation of, in the living cell (MAZK), A., ii, 643, 215.
 the system, nitric acid, and nitrous oxide, equilibrium in (LEWIS and FISHER), A., ii, 264.
 detection of (VAUREL), A., i, 1049.
Nitrites, detection of (DANE), A., ii, 524.
 detection of, by the diphenylamine test (WIDERS and RAY), A., ii, 656.
 detection of, in water (DENIGES), A., ii, 655.
 detection and estimation of, in water (TILLMANN and SUTTHOFF), A., ii, 767.

Nitrogen:—

- Nitrites**, estimation of (RUFF and LEHMANN), A., ii, 535.
 estimation of, in sewage (CLARKE), A., ii, 928.
 estimation of, in water KASTLE and ELVOYE, A., ii, 437; (BLANC), A., ii, 930; (SUPPLE), A., ii, 940.
 estimation of, gasometrically, sources of error in the (RUFF and GERSTEN), A., ii, 930.
 estimation of, by means of the action of hydrazine sulphate on (DEV and SEN), A., ii, 822.
- Nitrogen**, detection of, in organic compounds (HALENKE and KLING), A., ii, 1131.
 rapid estimation of (CLAASSEN), A., ii, 1027.
 estimation of, new distillation apparatus for the (MULLER), A., ii, 68.
 estimation of, by Kjeldahl's method (KOEFOED), A., ii, 67; (VAN RYN), A., ii, 226; (EDWARDS and CHADS), A., ii, 437; (ANDERSEN: V. LIEBERMANN), A., ii, 655; (KRIEGER), A., ii, 1027.
 estimation of, in the extractives of muscle (V. FIRTH and SCHWARZ), A., ii, 216.
 estimation of, in aliphatic amino-compounds (VAN SLIKE), A., ii, 779.
 estimation of, in organic compounds (FRANKLAND), T., 1783; P., 207, 309; (FABINYI), A., ii, 531.
 estimation of the amidic, in proteins (DENIS), A., ii, 163.
 estimation of, in soils (MITSCHERLICH and MERKES), A., ii, 68.
 estimation of, in rain-water from Groningen (HUIDIC and WELT), A., ii, 1128.
- Nitrogen-carbon linking** (EMDE and RUNKE), A., i, 714, 718.
- Nitrogen compounds**, stereochemistry of (FREUND and KUPFER), A., i, 911.
 relation between reactivity and chemical constitution of (CLARKE), T., 1927; P., 243.
- Nitrogenous substances**, degradation of by yeast (SCHWARZ), A., ii, 640.
- Nitro-group**, orientation of, in nitromyristic acid (SALWAY), T., 266; P., 20.
- Nitrohydrazo-compounds**, alkaline condensations of (GREEN and BEARDER), T., 1960; P., 228.
- "Nitrolime,"** analysis of (KAPPEN), A., ii, 933.
- Nitrometer**, flasks for use with the (M'CHEL), A., ii, 68.
- "Nitron method,"** estimation of, in Chili salt-petre by the (RUFF), A., ii, 69.
- Nitrosates**, action of, hydrolysis (CZESMANO), A., i, 186.
- Nitrosulphuric acid**, action of, on sulphuric acid, hydrolysis.
- Nitroso-chlorides**, action of, on amine on (CZESMANO), A., i, 186.
 cyclic, action of, with (RUFF and ALLEN), A., ii, 72.
- Nitroso-compounds**, action of, on (SCHUITER and SAZAN), A., ii, 730.
 action of diphenylketone on (SCHUITER and JELAND), A., ii, 730.
- Nitrosyl chloride**, formation of, at various temperatures, and its reaction with chlorine (BOUBNOFF and ALLEN), A., ii, 539.
- Nitrosylous sulphuric acid**, action of, on (RUFF), A., ii, 273.
- Nitrosylsulphuric acid**, by (RUFF and ALLEN), A., ii, 273.
- Nitrous acid**. See under Nitrogen.
- Nomenclature of carboxylic acids** (RUFF), A., i, 179.
- of spians** (RADULESCU), A., ii, 179.
- Nonane**, γ -halogen derivatives of (PICKARD and KENYON), A., ii, 185.
- Non metals**, thermal conductivity of (KICKEN), A., ii, 185.
- n-Nonoyl chloride**, action of, on wood and WEIZMANN, T., 1584, 214.
- n-Nonoylalanine**, α -amino, action of, on (HOPWOOD and WEIZMANN), T., 1583.
- n-Nonylasparagine**, α -amino, action of, on (HOPWOOD and WEIZMANN), T., 1583.
- n-Nonoylaspartic acid**, α -amino, action of, on (HOPWOOD and WEIZMANN), T., 1584.
- n-Nonoylglycine**, α -amino, action of, on (HOPWOOD and WEIZMANN), T., 211.
- n-Nonoyl-leucine**, α -amino, action of, on (HOPWOOD and WEIZMANN), T., 1582.
- n-Nonoylvaline**, α -amino, action of, on (HOPWOOD and WEIZMANN), T., 1582.
- Nonyl bromide** (V. BRAUN and SEN), A., i, 598.
- Nonylamine** and its derivatives (BRAUN and SOBERKE), A., ii, 598.
- n-Nonylglycine**, α -bromo- and hexoyl derivative (HOPWOOD and WEIZMANN), T., 1579.
- Norbixin** and its ethyl ether and tallic derivatives (VAN HASSEL), i, 551.

- Anti American cropper snake, croto-**
toxin (FARST), A., ii, 317.
- Antipyrin, cyano-** (V. BEAUN), A., i,
564.
- Antipyrin, phenylguanidine and its salts**
(FARST), A., i, 564.
- Asparaginase** estimation of, in various
tissues (HITSCHENKO), A., ii, 412.
- Asparaginase, the activity of, by the**
method (PICHINI), A., ii,
317.
- Asparaginase** (LEVENE and MEDIGER-
FARST), A., i, 410.
- Asparaginase, digestion and absorption of**
(LEVENE and SCHITTENHELM), A.,
i, 410.
- Asparaginase** (LEVENE and JACOB), A.,
i, 410.
- Fatty acids, a study of gastro intestinal**
absorption (LEVENE and MEDIGER-
FARST), A., ii, 744; (LONDON,
SCHITTENHELM, and WIRNER), A.,
ii, 745.
- Fatty acids, digestion of, by enzymes** (AMBERG and
JONES), A., i, 824.
- Fatty acids, the fermentation in the**
intestinal body (TSCHERNOWITZ), A.,
ii, 719.
- Fatty acids, metabolism. See Metabolism.**
- Fatty acids, cleavage of, by enzymes**
(AMBERG and JONES), A., i, 823.
- Fatty acids, LEVENE and MEDIGER-
FARST**, A., i, 698.
- Fatty acids, isoelectric point of**
(JONES and McHALES and DAVID
SON), A., i, 313.
- Fatty acids, role of, in plants**
(ZARATE), A., ii, 819.
- Fatty acids, LEVENE and MEDIGER-
FARST**, A., i, 698.
- Fatty acids, LEVENE and MEDIGER-
FARST**, A., i, 698.
- Fatty acids, studies in** (MENDALL and FINE),
A., ii, 1192.

A., ii, 535.
- Oleander bark, Algerian, constituents of**
(LEULIER), A., ii, 922.

- Oleic acid**, solubility of metals in (GATES, A., ii, 394).
 ammonium salt and separation of, from palmitic and stearic acids (FALLOOLA, A., i, 5, 174).
 behaviour of red blood-corpuscles in poisoning by (SCHMINCKE and FLURY, A., ii, 125).
 inhibition of the irritating action of, by cholesterol (LAMM, A., ii, 52).
- Oleocelaic acid**, preparation of (GAWALOWSKI, A., i, 416).
- Olone** and its oxime (EASTFIELD and TAYLOR, T., 2303; P., 279).
- Olivetoric acid**, metallic salts of (HESSE, A., i, 299).
- Olivetrol** (HESSE, A., i, 299).
- Opal**, effect of pressure on the change of, into quartz (SPEZIA, A., ii, 427).
- Open-chain compounds**, absorption spectra of (CHRYMIE, STEWART, WRIGHT, and REA, T., 1292; P., 153).
- Opianic acid** aldoxime, N-benzoyl derivative of, and its cinchonine salt (SCHIEBER and FLEISCHMANN, A., i, 382).
- Opium**, constituents of (VAN ITALLIE and KERESZT, A., i, 76).
 a new alkaloid from (DOBIE and LAUDER, T., 34).
 estimation of codeine in (ANDREWS, A., ii, 1144).
 estimation of morphine in (DEBOURDEAUX, A., ii, 345).
- Opium alkaloids** (VAN ITALLIE and KERESZT, A., i, 76).
 action of, on the alimentary canal (COHNHEIM and MODRAKOWSKI, A., ii, 616).
- Optical activity**. See under Photochemistry.
- Organic compounds**, photolysis of, by ultra-violet light (BERTHELOT and GAUDECHON, A., ii, 86, 242, 835).
 phosphorescence of, at low temperatures (DE KOWALSKI and DE DZIERZBICKI, A., ii, 3).
 influence of three- and four-membered carbon rings on the refractive and dispersive power of (ÖSTLING, P., 315).
 electrical double refraction of (LEISER, A., ii, 563).
 dielectric constants of (DOBROSERD-OFF, A., ii, 458).
 electrical effects accompanying the decomposition of (POTTER, A., ii, 913).
 temperature-coefficients of the molecular surface energy of (WALDEN, A., ii, 97).
- Organic compounds of phosphorus**, importance, heat of formation of (EMERY and BENZIE, A., ii, 1049).
 measurement of the induction period of substitution in, by polarography (A., ii, 713).
 rotatory power of, in, by polarography (PELLET, A., ii, 713).
 solubility equilibria of, in, by polarography (OLIVIERI, A., ii, 713).
 amalgams of, (McGOWAN, A., i, 270).
 reactivity of the halogen derivatives of, (T., 95; (SENIEP and TAYLOR, T., 1049; P., 119).
 additive, with metallic salts (SCHULTZ, A., i, 502).
 reduction and oxidation of, by polarography (SABATIER, A., ii, 1144).
 oxidation of, by polarography (HEIDER, A., ii, 1144).
 spontaneously oxidisable, by polarography (DELLING, A., ii, 1144).
 dihalogen, action of, on, by polarography (V. BRAUN and S. J. J., ii, 701).
 trichlorinated, action of, on, by polarography (BRENNAN and S. J. J., ii, 701).
 relative activities of, in, by polarography (P., 283).
 unsaturated, catalytic action of, by polarography (FUKIN, A., i, 1).
 toxicity of (STADLER, A., ii, 147).
 in soil (SCHREINER and S. J. J., ii, 147).
 colour reactions of, by polarography (A., ii, 1149).
 detection of nitrogen in, by polarography (KLEIN, A., ii, 1149).
 detection and estimation of, by polarography (BRENNAN, A., ii, 1149).
 estimation of arsenic in, by polarography (A., ii, 1023).
 estimation of carbon in, by polarography (V. KERESZT, A., ii, 1023).
 estimation of carbon in, by polarography (FRANKLAND, T., 178; P., 309).
 estimation of the elements in, by polarography (A., ii, 928).
 estimation of halogens in, by polarography (MACRAE, A., ii, 1149).
 A., ii, 532; (WALDEN, A., ii, 97).
 estimation of active hydrogen in, by polarography (ZEREWITINOFF, A., ii, 1023).
 (ODD), A., ii, 826).
 estimation of small quantities of, in (JAHN, A., ii, 1148).
 estimation of nitrogen in, by polarography (A., ii, 534).
 estimation of sulphur in, by polarography (A., ii, 67).

- Organic matter**, calcination of, without loss of phosphorus (FLEURET and LEVY), A., ii, 656.
- destruction of**, by bromine (MAGNIN), A., ii, 1035.
- estimation of**, in water (NOLLE), A., ii, 225.
- estimation of**, in water from sulphur springs (DUTRIEUX), A., ii, 1055.
- Organic radicals**, nature of (HINSBERG), A., ii, 75.
- Organism**, action of chlorinated aliphatic hydrocarbons on the (LIEBOWANN, BEHR, QUADRELLI, FRANZ, HERMANN, KNOBLAUCH, GUNDERMANN, and WERTH), A., ii, 634.
- behaviour of fatty isoacids in the** (PONZIO), A., ii, 1015.
- value of amino-acids in the** (AUBER, HALDEN, FUENO, GODET, and SCHUBERT), A., ii, 1002.
- electrometric method of study of the** reaction of liquids of the (QUASIMARIELLO), A., ii, 962.
- animal**, amount of alcohol excited by the (VOLTZ and BAUDOUIN), A., ii, 218.
- adaptation of the capacity of the**, to over feeding (GEAUF and GRIGAN), A., ii, 511.
- elimination of colouring matters by** the (SISKY and PORCHER), A., ii, 515.
- ratio of fatty acids to unsaponifiable substances in the** (COSTANTINO), A., ii, 627.
- 20's**, value of amino-acids in the (ACQUAVIVONE and MARKWALDER), A., ii, 631.
- Cratichneumon* *lithum***, constituents of the (PIERRE), P., 284.
- Ornithine** monophosphate, crystalline (REINER), A., i, 515.
- Orthite** rich in scandium, from Finland (MAYER), A., ii, 466.
- Orthoclase** and microcline, distinction between (VERNAISKY and HELVINSKY), A., ii, 122; (BARBIER), A., ii, 755.
- Orthoformic acid**, ethyl ester, action of zinc and magnesium organic compounds (SHIMANOVSKI), A., i, 10.
- Ortho-oxalic acid**, diphenyl ester (SCHULKE and MAYR), A., i, 126.
- ethyl ester** (RUDIGERSWERKE and KUNZE-ELSHOFF and GEISCH), A., i, 439.
- rhithio-carbonic acid**, *p*-tolyl ester and its derivatives (ARNET), A., i, 919.
- rhithioformic acid**, benzyl ester, preparation of (SMYTHE), A., i, 966.
- ethyl ester** (ARNET), A., i, 919.
- Osmium**, osyammmonium chloride a (GRIEBER and MAISCH), A., i, 18.
- Osmichlorides** (GRIEBER and WALSINGER), A., i, 191.
- Osmotic pressure**. See under Diffusion.
- Ovary**, frogs, glycogen in the (BLEIBREU), A., ii, 811.
- Oven**, new constant temperature (SIAP), A., ii, 109.
- electrical tungsten resistance** (FISCHER and FIEBIGER), A., ii, 694.
- Oximucoid**, dissociation of salts of (ROBERTSON), A., i, 91.
- Ox**, lact of. See Liver.
- Oxalacetic acid** lacture experiment to show the fermentation of (NEUBERG and KLOTZ), A., ii, 976.
- lacture salt** (HIDDELL), T., 235.
- Oxalotelluric acid**, salts of (ROSENHEIM and WEINBERG), A., i, 109.
- Oxalhydrazinic acid**, ethyl ester, and its oxalate and benzylolene derivative (STOLTE), A., i, 357.
- Oxalic acid**, preparation of, from sawdust (HEDENSTROM), A., i, 767.
- action of light on**, in the presence of mineral salts (BACON), A., ii, 5; (BACON and KODAK), A., ii, 564.
- dissociation constants of** (ENKLAAR), A., i, 419; ii, 1071.
- neutralisation curve of** (ENKLAAR), A., i, 602.
- solubility of**, in other acids (MASSON), P., 328.
- action of**, on starch and dextrin (OCHSNER DE CONTON and RAYNAUD), A., i, 779.
- metabolism**. See under Metabolism.
- fermentative oxidation of** (ZALESKI and REINHARD), A., ii, 700.
- poisoning** (SARONAT and ROUBIER), A., ii, 515.
- oxitability of nerves in** (CHIARI and FROHLING), A., ii, 1019.
- in wines** (MONNIER), A., ii, 648.
- metabolic salts**, decomposition of (GASASSINI and SCANDOLA), A., i, 121.
- reactions of** (OCHSNER DE CONTON), A., i, 419.
- calcium salt**, reactions of (OCHSNER DE CONTON and RAYNAUD), A., i, 352.
- dysprosium salts of** (JANICH and DILL), A., ii, 493.
- sodium salt**, preparation of (BOHRINGER & SOHN), A., i, 419.
- stability of the double salts of**, with sodium and nickel, and with sodium and cobalt (DOBSON), P., 260.
- yttrium potassium salt of** (PRATT and JAMES), A., i, 353.

- Oxalic acid**, preparation of esters of (SCHEIBLE, A., i, 419.
thio-, complex salts of (ROBINSON and JONES, P., 279.
- Oxalomonohydroxamic acid** and its silver salt (PALAZZO and OLIVERI-MANDALÀ, A., i, 428.
- Oxalopyrrotartaric acid**, ethyl ester products of the action of hydrobromic acid on (BLAISE, A., i, 798.
- Oxaluria** (SEEKOWSKI and MOZDZENSKI, A., ii, 311.
- Oxalyl chloride**, action of, on amines and amides (BOENWATER, A., i, 616.
- Oxalylidibenzanilide** (BOENWATER, A., i, 617.
- Oxalylidi diglycylglycine**, ethyl ester (BOENWATER, A., i, 617.
- Oxalylidiglycine**, ethyl ester (BOENWATER, A., i, 617.
- Oxalylidiglycylglycine**, ethyl ester (BOENWATER, A., i, 617.
- Oxalylidi-glutaminic acid**, diethyl ester (BOENWATER, A., i, 617.
- Oxalylidimethylethylurethane** (BOENWATER, A., i, 617.
- Oxalylidureide** (BOENWATER, A., i, 617.
- α -Oxalyl- β -methylsuccinic acid**, ethyl ester, *p*-nitrophenylhydrazone (BLAISE and GATTEL, A., i, 520.
- Oxalylphenylacetoneitrile**, acylation of (DIECKMANN, A., i, 456.
- Oxalylsuccinic acid**, ethyl ester, derivatives of (WISLICENIS and WALDMÜLLER, A., i, 603.
- Oxalylsuccinonitrile**, acylation of (DIECKMANN, A., i, 456.
- Oxamethane**, action of, with potassium bromoacetamide (MARGUIN, A., i, 358.
- Oxamide**, aromatic derivatives of (SUIDA, A., i, 365.
- Oxanil-4 arsinic acid**, and nitro- (FARBWERKE VOHM, MEISTER, LUCIUS, & BRÜNING, A., i, 594.
- Oxanilic acid**, *p*-cyano-, methyl and ethyl esters of (BOGERT and WISE, A., i, 46.
- Oxanilide**, *p*-amino-, and its salts and *m*-hydroxy- (SUIDA, A., i, 366.
- di-p*-cyano-** (BOGERT and WISE, A., i, 46.
- Oxanilide-*o*-carboxylic acid** and its metallic salts (SUIDA, A., i, 365.
- Oxanthrone** and its acetate (MEYER, A., i, 194.
- iso*Oxazolones**, action of diazomethane on (OLIVERI-MANDALÀ and COPPOLA, A., i, 492.
- Oxasonanthrone** (ULLMANN and v. DER SCHALK, A., i, 166.
- Oxidation**, selective (JONES and A., ii, 168.
and reduction by catalysts (JONES and GLINKA, A., i, 579.
- Autoxidation** THUNDER, A., i, 250.
- Oxide**, C_2H_2O , from 3-methyl-2-butyne (UMNOVA, A., i, 250.
- Oxides**, acidic, heat of combustion of, with sodium peroxide (MILLER, ii, 966.
- Oximes**, transformation of (PATTERSON and Mc MILLAN, A., ii, 545.
cyclic, catalytic reduction of (PATTERSON and MURRAY, A., i, 535.
N-phenyl ethers of (ASCHER and SANDRI and ALAZZI, A., i, 544.
- Oxindole-3 aldehyde** and its derivatives (FRIEDLANDER and KIEFER, A., i, 1022.
- Oxindoleanil** and its derivatives (FRIEDLANDER and KIEFER, A., i, 1022.
- Oxindole-3 carboxylic acid**, ethyl ester (KALB, A., i, 68.
- Oxomalonic acid**, ethyl ester, properties of (STRACHAN, A., i, 95.
action of, with arylamines and alcohols (CHRIST, H., and LEWIS, A., i, 367.
- Oxonium** dibromides, influence of masses of reacting substances on formation of, in organic reactions (TSCHILINZEFF and KOSCHKE, A., ii, 706.
- Oxyberberine**, synthesis of, and its salts (PICTET and GAMS, A., i, 18.
- iso*Oxyberberine** and its acetate, and nitroso- (BLAND, PETERSON, and ROBINSON, P., 59.
- neo*Oxyberberine** and its salts (BLAND, PETERSON, and ROBINSON, P., 59.
- neo*Oxyberberineacetone** and its chloride (PYMAN, T., 1934.
- Oxydase** in fruits (BASSETT and JONES, A., ii, 425.
estimation of, in animal tissues (VERNON, A., ii, 790.
- Oxydases**, action of (HARRIS and POLOTZKY, A., i, 955; HARRIS and MERIK, A., i, 956.
colorimetric detection of (HARRIS, ii, 675.
- Oxygen**, production of, in the fraction of air (SWINBURNE, A., 387.
extraction of, from commercial air (GUICHARD, A., ii, 934.
spectroscopy of (KAYSER, A., i, 785; (STETTING: SIMS, A., 563.

- Oxygen**, negative pole spectrum of (CHURCH, A., ii, 1041).
- Absorption of ultra-violet rays by (V. WATKINSON, A., ii, 1).
- Geometrical diameter for (MATTHIAS and THOMAS, A., ii, 387).
- Boiling point of (DANES and CHORWICK, A., ii, 854).
- Rate of evaporation of (BANSCHALL, A., ii, 382).
- Solubility of, in sea-water (WHITFIELD and WHITFIELD, A., ii, 271).
- Properties of (MASS and MONTAGNE, A., ii, 289; TCHOUZOFF, A., i, 415; TAKAGI, A., i, 514).
- Analogy between the behavior of (ANGELL, A., i, 620).
- Influence of inhalation of, on lactate produced by hard work (FENNELL and HILL, A., ii, 738).
- Influence of respiration of, on the blood (WARRING, A., ii, 271, 533).
- Necessity of, for growth of mammal in utero (LOEB and FLEISCHER, A., ii, 1297).
- Description of, in respiration (DODGINS and HADGANG, A., ii, 737).
- Estimation of, dissolved (WINKLER, A., ii, 322, 532).
- Estimation of, in air, volumetrically (WATSON, T., 1460; P., 135).
- Estimation of, dissolved in sewage effluents (TAKAGI, A., ii, 928).
- Oxyhemoglobin**, substances accompanying, in its crystallization (THOMAS, A., i, 590).
- Crystallographic properties of (DE STOKER, A., ii, 620).
- Synthesis of (WATKINSON, A., i, 500).
- 2-Oxy-9-methylpurine** (THOMAS, A., i, 597).
- Oxyproteic acids**, and their role in metabolism (ROSDOLSKY, A., ii, 1).
- Estimation of, in serum fluids and in blood (CZERNICK, A., ii, 302).
- Oxyprotonilphonic acid** (BILKOWSKI and KRAUT, A., i, 198).
- Oxysolanol** (DUBO and CASCINI, A., i, 179).
- Oxy-1-thionaphthencarboxylic acid** (n-butyl, ethyl ester) (KALFA and CO., A., ii, 871).
- Oxythionaphthylacanthrene** (BREZEMANN and ZUPPE, A., i, 187).
- Oxythiophene** (LANERY, A., i, 749).
- Oxytriphenyldihydrotriazole** (BEN-H and RUPPENTHAL, A., i, 37).
- Ozone**, formation of (LECHNER, A., ii, 797).
- Formation of, by electrolysis (ARCHIBALD and V. WATKINSON, A., ii, 1083).
- Preparation of, by chemical means (MARGUIN, A., ii, 387).
- Production of, at a low temperature (JON, A., ii, 387).
- Dry decomposition of (CHAUDMAN and JONES, T., 1811; P., 224).
- Estimation of, volumetrically (LECHNER, A., ii, 822).
- Oxide** (C.H. O.), from a polyimide of diaminodichloride (A., i, 26).
- C.H. O., from polyimide of isoprene (TCHOUZOFF, A., i, 26).
- C.H. O., from polyimide of diisoprene (TCHOUZOFF, A., i, 27).
- Oxkerite** in petroleum (KOSK, A., i, 761).

P.

- Paeonol**, presence of, as a glucoside (HAGEN, A., ii, 426).
- Paeonol** α , β , and γ nitrophenylhydrazones and bromo (TORREY and ADAMS, A., i, 39).
- Palladium**, use of, in hydrogenation (BEEFAP, A., i, 123, 533, 776).
- Palladium alloys** with gold, occlusion of hydrogen by (BERRY, T., 463; P., 56).
- Palmitic acid**, equilibrium of, with its sodium salt (THOMAS and WHITE, T., 1908; P., 216).
- Separation of, from oleic acid (FALCETTA, A., i, 171).
- Amine salts and separation of, from oleic acid (FALCETTA, A., i, 6).
- Sodium salt, solution of (McBAIN and FORTY, A., i, 849).
- Palmitic acid**, a bromo, amide of, and a oleo, calcium salt and amide of (PONZIO, A., ii, 1015).
- Pancreas**, effect of copious water drinking on the activity of the (HAWK, A., ii, 214).
- Pentose from the (LEVENE and JAMES; NEUBERG; REWALD, A., i, 97).
- Presence of the secretion of, in the blood (DRENNAN, A., ii, 995).
- Fetal, passage of the secretion of, into the maternal blood (CARLSON and DRENNAN, A., ii, 995).
- Pancreatic extract** and muscle plasma, action of, on sugars (LEVENE and MAYER, A., ii, 114).
- Papaveraceae**, alkaloids from the (GAS-

- Papaveraldine**, identity of ranthaline with (DOWSON and PERKINS, T., 135; P., 4.
- Paper**, detection of acidity in (STRACHAN, A., ii, 542.
- Paraconic acids**, substituted, conversion of, into cyclopropanedicarboxylic acids (BARHIER and LACQUIN, A., i, 722.
- Paraffin** oil, solubility of water in (GROSCHUFF, A., ii, 595.
- Paraglycocholic acid** (LEITCH, A., i, 784.
- Paraldehyde**. See under Acetaldehyde.
- Parathyroidectomy**, effect of, on metabolism (GREENWALD, A., ii, 507.
- Parathyroid tetany** (CARLSON and JACOBSON, A., ii, 622.
- Parula** root, alkaloids of (SCHOLTZ, A., i, 913.
- Parisite** from Quincy pegmatite (PALACHE and WARREN, A., ii, 614.
- α and β -Particels**. See under Photochemistry.
- Passivity**, phenomena of (HABER and ZAWADZKI, A., ii, 1053.
- Pear**, composition of seeds of (HYDER, A., ii, 1024.
- tree leaves, arbutin in (BOURQUELOT and FICHTENHOLZ, A., i, 803; ii, 143.
- Pearceite**, occurrence of (VAN HORN and COOK, A., ii, 611.
- formula of (VAN HORN), A., ii, 597.
- Pearls**, artificial analysis of (CERRERO and MAYO, A., ii, 824.
- Peas**, constituents removed from, by water and aqueous solutions (POPPE, A., ii, 428.
- Peganum harmala*** (rue), pharmacology of (FLURY, A., ii, 138.
- Penicillium glaucum***, influence of acetic acid on the growth of (REICHEL, A., ii, 144.
- Pentadecyl chloride** (V. BRAUN and SOBECKI, A., i, 598.
- Pentadecylamine**, benzoyl derivative (V. BRAUN and SOBECKI, A., i, 598.
- Pentadecyl- α and β -naphthylamine**, and their salts and derivatives (LESPIEU, T., 830, 832.
- Pentaethylphloroglucinol**, ethyl ester of (HERZIG and ERTHAL, A., i, 777.
- 3:4:2':4':5'-Pentamethoxychalkone** (BARGELLINI and AVIRITIN, A., i, 68.
- 4:2':3':4':8'-Pentamethoxychalkone** (BARGELLINI and BINI, A., i, 212.
- α -Pentamethylacetoacetic acid**, ethyl ester (WAHLBERG, A., i, 708.
- Pentamethyleneoxyanethylpntrescine** (V. BRAUN), A., i, 563.
- Pentamethyleneoxyanpropylpntrescine** (V. BRAUN), A., i, 563.
- Pentamethylenediguanaldine**, synthesis of, and its aurichloride (REICH, A., i, 620.
- Pentamethylene ethylpntrescine**, salts (V. BRAUN, A., i, 562.
- Pentamethylenepropylpntrescine**, salts (V. BRAUN), A., i, 562.
- α -Pentamethylglutaric acid**, ethyl ester, and its silver salt (ZEPP, A., i, 419.
- Pentamethylorcinol** and (HERZIG, WENZEL, ZEPP, A., i, 777.
- Pentamethylphloroglucinol**, ethyl ester of, with magnesium metal (HERZIG and ERTHAL, A., i, 777.
- Pentamethylquercetin**, and its derivatives, dibromonitro-, and dinitro-, and their salts (WILSON, P., 164.
- Pentamethylquercetinazo β -naphthylamine** (WILSON, P., 165.
- Pentamethylquercetindiazonium chloride** and sulphate (WILSON, P., 165.
- Pentane**, *see* tetrabromo- and *see* dinitro-, and its derivatives (V. BRAUN and SOBECKI, A., i, 581.
- n*-Pentane**, *see* tetrabromo- and *see* dinitro-, and its derivatives (V. BRAUN and SOBECKI, A., i, 581.
- n*-Pentane-1 carboxylic acid**, ethyl ester, amino-, preparation of, and copper salt (ZELINSKY, A., i, 777.
- n*-Pentane-1,2-diol**, derivatives of (HERZIG and NERESHMEIER, A., i, 777.
- n*-Pentane-1,1:3:3 tetracarboxylic acid**, ethyl ester (THOLE and LANGE, T., 2185.
- Pentane- $\alpha\beta$ -tricarboxylic acid**, ethyl ester and cyano-, ethyl ester (HOPE and PERKINS, T., 762; P., 415.
- Pentane- $\beta\beta$ -tricarboxylic acid**, potassium salts and resolution of (MARTIN, A., i, 12.
- cyclo*-Pentane**, catalytic hydrogenation of (GODCHOT and TABOURY, A., i, 777.
- Pentan- δ -one**, β -bromo- (WILSON and MAAG, A., i, 25.
- Pentan- γ -one- β -ol** and its cyanohydrin and semicarbazone (GATTHERY, A., i, 415.
- Pentathionic acid**. See under Sulphur.
- Δ^8 -Pentenoic acid**, ethyl ester (LESPIEU, A., i, 106.
- Δ^8 -Penten- γ -ol**, β -bromo-, and its phenylurethane and α -bromo- (LESPIEU), A., i, 347.
- Δ^8 -Pentenylamine** and its derivatives (V. BRAUN), A., i, 613.

- Pentamers** of (LESPICAT, A., i, 147).
- Pentoses** in fungi (WIEGELS and TOLLENS, A., ii, 63; (Box and NIELIG, A., ii, 644).
- in milk (SHOOKY and LATHROP, A., ii, 146).
- oxidation of (BODENBERG and TOLLENS, A., ii, 55; (FROHL, A., ii, 160).
- oxidation of, in cereals and in wood (OGI, ISHIDA and TOLLENS, A., ii, 645).
- Pentose** from the pancreas (LEAFSE and ZACHS, NEUBERG, REWALD, A., i, 27).
- Pentyl-pentananone** and its isomers and semicarbazone (GODHART and LABUREY, A., i, 385).
- Pepper**, white, constituents of (BODENBERG and TOLLENS, A., ii, 64).
- Peppermint oil** (SCHIMMELA GO, A., i, 677).
- Pine**, leaves of *Monilia piperita* (MEYER, A., i, 138).
- Pine**, constituents of (SCHIMMELA GO, A., i, 893).
- Peppin** in the gastric juice of the calf (KASOZY, A., i, 827).
- Perforated transport** of (PEKELHAEGH and RINGEL, A., i, 1051).
- Perforation** of, on elastin and other proteins (AMERHOLDEN and WACHSMUTH, AMERHOLDEN and STRAUH, A., i, 511; (AMERHOLDEN and FRIDOLF, A., ii, 506).
- Perforation**, on the products of hydrolysis (LAWSON, ROBERTSON and BINGG, A., i, 509).
- Perforation**, of, with rennin (VAN HASSELT, A., i, 248; (KROGER, A., i, 698).
- Perforation**, of, by means of elastin (AMERHOLDEN and MEYER, A., ii, 509).
- Peptone**, Witte's action of formaldehyde on (SCHREYER, A., i, 216).
- Peptone**, of, in presence of albumin (SALIKOWSKI, A., ii, 626).
- Peptones**, apparatus for cryoscopic measurements of (LEMAIRE, A., ii, 147).
- Perboric acid**. See under Boron.
- Perferriocyanides**. See under Iron.
- Perhydrazo**, reduction of nitrates by (BACH, A., i, 759).
- Perhydrazo**, preparation of (BACH, A., i, 742).
- Peridotites** in New Caledonia (LACROIX, A., ii, 496).
- Perillaldehyde** and its derivatives (SEMMELER and ZAAR, A., i, 218).
- Perillaldehyde** and delonide (SEMMELER and ZAAR, A., i, 218).
- Perillonitrile** (SEMMELER and ZAAR, A., i, 218).
- Perillyl alcohol** and its derivatives (SEMMELER and ZAAR, A., i, 218).
- Periodic reactions**. See under Affinity, chemical.
- Periodic system** (SEMMELER, A., ii, 198; (BAUR, A., ii, 480).
- Periodic system** of the (ADAMS, A., ii, 193).
- Periodic system** of the (SANDFORD, A., ii, 874).
- Periodic system** of the elements in the, in a spiral (EMERSON, A., ii, 128).
- Periodic system** of the elements in relation to the (HOLKINS, A., ii, 698).
- Periodic system** of the elements in the (SCHERLING, A., ii, 394).
- Periodic system** of the elements in the (VAN DEN BROEK, A., ii, 709).
- Permanganates**. See under Manganese.
- Peroxide**, $C_6H_5O_2Cl_2$ from triphenylmethyl carbonyl chloride (STAUFINGER and UHAR, A., i, 639).
- Peroxides**, preparation of (ERLER and KRASS, A., ii, 891).
- Peroxydase**, effect of heat on, in milk (VAN ECK, A., ii, 1144).
- Peroxydase**, detection of (FISCHER, A., ii, 118).
- Pertitanic acid**. See under Titanium.
- Petroleum**, cholesterol and ozokerite in (KROGER, A., i, 761).
- Petroleum**, light, lecture experiment, on the extinction of burning (RATHEN, A., ii, 385).
- Petroleum**, optical investigation of (RAKUSIN, A., i, 761).
- Petroleum**, optical investigation of (RAKUSIN, A., i, 761).
- Petroleum**, hydrocarbons from (COTACHESCU, A., i, 101).
- Petroleum**, solubility of water in (GROCHUFF, A., ii, 595).
- Petroleum**, action of formaldehyde on (NASTIKOFF and MALJAROFF, A., i, 219).
- Petroleum**, heavy, determination of the density of (SANDERS, P., 250).
- Petroleum**, detection of, in turpentine (KLEIN, A., ii, 341).
- Petroleum**, estimation of sulphur in (SANDERS, P., 323).
- Phagocytosis**, influence of iodoform, chloroform, and other substances on (HANGROBER, DE HAAN, and BUBANOVIC, A., ii, 504).
- Phase rule**. See under Equilibrium.

- Phenacetylhomopiperonylamine** (FARBENFABRIKEN FORM. F. BAYER & CO.), A., i, 1015.
- Phenanthraphenazine**, 4-amino-, and 4-hydroxy- (SCHMIDT and SCHAIERER), A., i, 367.
- Phenanthraphenazinesulnic acid** (BERTHELM), A., i, 1056.
- Phenanthraquinol**, synthesis of acyl derivatives of (KLINGER and ROEDERMANZ), A., i, 633.
- 4-amino-, hydrochloride (SCHMIDT and SCHAIERER), A., i, 386.
- Phenanthraquinone**, action of sunlight on aldehydes and (KLINGER and ROEDERMANZ), A., i, 633.
- and 4-nitro-, semicarbazones (SCHMIDT, SCHAIERER, and GLATZ), A., i, 239.
- 4-amino-, 4-hydroxy-, and 4-nitro-, and their derivatives (SCHMIDT and SCHAIERER), A., i, 386.
- Phenanthraquinoneoxime**, 3-bromo-, 3- and 4-nitro-, semicarbazones of (SCHMIDT, SCHAIERER, and GLATZ), A., i, 239.
- Phenanthraquinone-2-sulphonic acid**, methyl ester (SANDQVIST), A., i, 191.
- Phenanthraquinone-2-sulphonylchloride** (SANDQVIST), A., i, 190.
- Phenanthrene**, synthesis of (KENNER and TURNER), P., 92.
- hydrogenation of, in the presence of palladium (BRETHER), A., i, 123.
- electrolytic reduction of (BRETEAU), A., i, 776.
- 4- and 9-amino-, 2- and 4-nitro-, and their derivatives (SCHMIDT and HEINLE), A., i, 626.
- 4-hydroxy-, synthesis of (BEHREND, LUDEWIG, and KLINCKHARD), A., i, 238.
- Phenanthrene series** (SCHMIDT, SCHAIERER, and GLATZ), A., i, 239; (SCHMIDT and SCHAIERER), A., i, 386; (SCHMIDT and HEINLE), A., i, 626.
- 5:5'-Phenanthrenebis-3-ethylrhodanic acid** (BUTSCHER), A., i, 333.
- 5:5'-Phenanthrenebis-3-phenylrhodanic acid** (BUTSCHER), A., i, 333.
- Phenanthrene-9:10-diketodicarboxylic anhydride** and its silver salt (WILLGERODT and ALBERT), A., i, 833.
- Phenanthrene-2-sulphonic acid**, salts and esters of (SANDQVIST), A., i, 190.
- Phenanthrene-2-sulphonyl chloride** and its derivatives (SANDQVIST), A., i, 190.
- Phenanthridone**, preparation of derivatives of (BADISCHE ANILIN- & SODAFABRIK), A., i, 1026.
- 10-Phenanthrol**, 2-benzoylamino- (AUWELLS, DANNFEL, and BOENNECKE), A., i, 160.
- 9-Phenanthrylacacetamide** (WILKIE and ALBERT), A., i, 882.
- 9-Phenanthrylacetic acid** (WILKIE and ALBERT), A., i, 882.
- Phenanthriazine**, 3-hydroxy-, 3-hydroxy-, and 7-hydroxy-, and 7-hydroxy- (SCHMIDT, SCHAIERER, and GLATZ), A., i, 239.
- Phenazine**, compounds of, resorcinol, and cat. of, off and v. OSTROMER, 849.
- Phenazine**, 2:7-dibromo-, and 2:7-di-iodo-, and the (BAMBERGER and HAN), A., i, 1031.
- Phenazoxonium**, 5-amino-, 5-diamino-, 5-acetyl-derivative of (KEHEMANN and LOWE), A., i, 1031.
- Phenanthionium**, 3:5-diamino-, derivative, salts of (KEHEMANN and STEINBERG), A., i, 1031.
- o-Phenetidine**, 5-chloro-, and derivative (ORTON and KING), A., i, 1199.
- p-Phenetidine**, 5-chloro-, and derivative (ORTON and KING), A., i, 1199.
- p-Phenetyldignanide** and derivative (COHN), A., i, 924.
- Phenol**, molecular complexity of (HARTUNG), A., ii, 607.
- and water, the system (MAARSE), A., ii, 579.
- quantitative examination of, reduction of one atom of (HOLLEMAN and RINK), A., i, 535.
- bromination of (DIANA and KANTLE), A., i, 902.
- oxidation of, by bacteria (ARDEEN and LOCKER), A., i, 1031.
- and o-, and p-nitro-, derivatives of, with benzoyldiamine (EVEREST and McCOMB), A., i, 1031.
- derivatives containing a methyl group, syntheses with (KUNZEN), T., 36, 1031.
- P., 157, 263.
- detection of (WILKIE), A., i, 882.
- estimation of, and p-nitro- (SIEGFRIED and ZIMMERMANN), A., ii, 941.
- Phenol**, o-amino-, salts of, and o-hydroxyphenylamine, and condensation with acetyl- (SUIDA), A., i, 284.
- 2:4:6-tribromo-, red and white, salts and yellow mercuric salt (TORREY and HUNTER), A., i, 1031.
- 2-bromo-4-amino-, and 2-bromo-4-amino- (KAUFMAN), A., i, 993.

- Phenol**, 4-chloro-6-nitro-2-amino, acetyl derivative (AKTIEN-GESELLSCHAFT FÜR ANILIN-FABRIKATION), A., i, 423.
- orange mercurous salt (TOLLEY and HUMER), A., i, 283.
- compound of, with quinonolide (KNORR), A., i, 654.
- nitro-, colour change in, produced by sunlight (BARKER), P., 168.
- nitro (ammon. propenyl) derivative (MILBACH and KUNZEN), T., 2041.
- ortho-amino-, valeryl derivative, A., 1235.
- trans-1,4-diamino-, isovaleryl derivative (MILBACH and KUNZEN), T., 2042.
- Phenols**, capillary rise of (SKARF and PHILLIPS), A., ii, 587.
- scopy of (GONF), A., ii, 553.
- ylation of (HILDE and ELMICH), A., ii, 777.
- ylation of (GILLES and KING), P., 1186; P., 139.
- ylation of, by ferric salts (GILLES and KING), A., ii, 572.
- ylation of, with anthraquinone (SCHALWIN, KUNZEL, NAUMOFF, GANDUIN, BUNSKOFF, and IMITZOFF), A., i, 656.
- zinc of bromine and chlorine on (ZINKE, FRIEDLÉDER, and KEMPE), A., i, 439.
- zinc of iodine on, and their volumetric estimation (WILKIE), A., ii, 546.
- catalytic oxidation of, in presence of iron salts (GILLES and KING), A., ii, 795.
- additive compounds of, with aromatic *p*-nitroderivatives (SUDHONATH and BEARD), T., 209; P., 5.
- alkylated, action of nitric acid on halogen derivatives of (ZINKE and BORNWISER), A., i, 215.
- hydrolytic, arylazo compounds of (BROWN and HICKING), A., i, 244.
- Phenols**, nitro-, ammonium salts of (KOLZANSKI), A., i, 276.
- Phenols**, estimation of, in herbicides (JUNE LIEBRI and MOOSER), A., ii, 212.
- Phenolanthrone**, tetrahydro-, di-, tetra-, and hexahydro- (SCHALWIN, KUNZEL, NAUMOFF, GANDUIN, BUNSKOFF, and IMITZOFF), A., i, 656.
- Phenolase**, behaviour of, to acids (BLACH and BUNSKY), A., i, 524.
- Phenol 3-carboxylic acid**, 4-amino-, vinyl derivative (KALLE & Co.), A., i, 666.
- Phenolcarboxylic acids**, methylcarbonate derivatives of, and their use in synthetic operations (FISCHER and FRIEDBERGER), A., i, 874.
- Phenolic ethers**, elimination of methoxy-groups from (THOMAS and STEINLING), A., i, 717.
- additive compounds of, with aromatic *p*-nitroderivatives (SUDHONATH and BEARD), P., 111; P., 5.
- Phenolphthalein**, physiological action of (KORNER), A., ii, 515.
- salts of (KORNER and MARSHALL), A., i, 500.
- mono- and carbomono-, tetrahydro-, and tetrahydro- (RUFF), A., i, 301.
- estimation of, volumetrically (ZOTTER), A., ii, 163.
- Phenolphthalein diphenyl ether** (FERRARIO and NICOMAS), A., i, 317.
- Phenolphthalic acid**, potassium salts of (KORNER and MARSHALL), A., i, 984.
- Phenolsulphonic acid**, method of estimation in water (CHAMOT, PRATT, and REEDFIELD), A., ii, 381.
- Phenol-sulphonic acid**, isolation of, and its metallic salts (OBERMILLER), A., i, 412.
- Phenol-sulphoxide**, *p*-chloro-, ethyl ether (HILDITCH and SMILES), T., 416.
- benzoyl derivative (HILDITCH and SMILES), T., 980.
- Phenosafranine**, isomide of (KEHRMANN and RIEHA Y PUNTI), A., i, 926.
- Phenosafranine**, salts and derivatives of (KEHRMANN and RIEHA Y PUNTI), A., i, 927.
- Phenothioxin**, formation of (FERRARIO), A., i, 555.
- Phenol-Aktiengesellschaft für Anilin-Fabrikation**, A., i, 903.
- synthesis of derivatives of, and 2,7-di-chloro-, and its oxides (HILDITCH and SMILES), T., 413; P., 44.
- Phenothoxonium hydrochloride**, 2,7-di-chloro- (HILDITCH and SMILES), T., 979.
- Phenoxazine**, 5-amino-, and its hydrochloride and acetyl derivative (KEHRMANN and LOWRY), A., i, 1033.
- Phenoxazonium chloride**, 3:5:9-trinitro-, influence of, on trypanosomes (LANKAS and ROUDSKY), A., ii, 911.
- Phenoxide**, *p*-nitrothio-, sodium (FARBWERKE VOEM. MEISNER, LUCIUS, A. REINING), A., i, 411.
- Phenoxyacetic acid**, salts of the rare earth metals (PRATT and JAMES), A., ii, 893.
- thulium salt (JAMES), A., ii, 892.

- Phenoxyacetylacetophenone** (V. WALTHER and LITTEK, A., i, 237.
- a-Phenoxyacetylphenylacetoneitrile and p-chloro-** (V. WALTHER and HERSCHEL, A., i, 237.
- Phenoxyamyltrimethylammonium hydroxide and iodide** (V. BRAUN, A., i, 612.
- 1-Phenoxyanthraquinone monoxime** (FERUND and ACHENBACH, A., i, 70.
- 8-Phenoxybutyltrimethylammonium hydroxide and its salts** (V. BRAUN, A., i, 612.
- 7-Phenoxy- α -p-chlorophenylacetoacetic acid, ethyl and methyl esters and their derivatives** (V. WALTHER and HERSCHEL, A., i, 238.
- 7-Phenoxy- α -p-chlorophenylcrotonenitrile. Banning-** (V. WALTHER and HERSCHEL, A., i, 238.
- Phenoxymethyl ethyl ketone and its derivatives** (BLAINE and PICARD, A., i, 175.
- 7-Phenoxy- α -phenylacetoacetamide** (V. WALTHER and HERSCHEL, A., i, 238.
- 7-Phenoxy- α -phenylcrotonenitrile. β -amino** (V. WALTHER and HERSCHEL, A., i, 237.
- 7-Phenoxypropyltrimethylammonium iodide** (V. BRAUN, A., i, 612.

- a* Phenyl lactamide (STAUDINGER and RIZOVKA, A., i, 463).

- Phenyl lactic acid, *p*-hydroxy-, behavior of, in the animal body (KOTAKE), A., ii, 53.
- Phenylmalonic acid, 2,6-dinitro-, ethyl ester (BORSCHKE and RANSCHKEFF), A., i, 332.
- Phenylmelamine. See Cyanuric anilide.
- Phenylmercuric oxide, *p*-chloro-4-chloro-2-nitro-, and *o*-nitro- (FARBEN-FABRIKEN VORM. F. BAYER & CO.), A., i, 1056.
- Phenylmetasilicic acid, anhydride of (KIPPING and HACKFORD), T., 141; P., 9.
- Phenylmethanesalicylic acid. See Phenylhomosalicylic acid.
- 1-Phenyl-4-*p*-methoxybenzylhydantoin, 2-thio- (JOHNSON and BEATLEHILL), A., i, 814.
- α -Phenyl-*p*-methoxycinnamic acid (BODOUX), A., i, 783.
- Phenyl *p*-methoxystyryl ketone, *di*-bromide, elimination of bromine from (WILSON and BORN), P., 197.
- Phenyl *p*-methoxy-, and *o*-tolyl iodonium iodides (WILGEBRODT and SCHLOSS), A., i, 716.
- 5-Phenyl-10 methylacridonium thiocyanate (HANTZSCH), A., i, 675.
- 8-Phenyl α methylacrylic acid, crystallography of nitro-derivatives of (RAFFALDI), A., i, 129.
- ethyl ester (POSNER), A., i, 53.
- ω -Phenylmethylaminoacetophenone phenylhydrazones and semicarbazone (BUSCH and HEFFLE), A., i, 584.
- Phenyl- ϵ -methylaminostyryl ketoneanil (KAUFMANN and PLÄY JANINI), A., i, 916.
- Phenylmethylammonium osmiumchloride (GUTHRIE and WALBINGER), A., i, 191.
- platinibromide (GUTHRIE, BAURIED-EL, and OHEFMAIER), A., i, 33.
- 1-Phenyl-2 methylbenzimidazole, 4,7-dinitro-6-hydroxy-*p*-amino-, and *p*-acetyl-amino- (MELDOLA and KUNTZEN), T., 38.
- 1-Phenyl-3-methyl-2-isobutyl-2-benzimidazolol, 4,7-dinitro-6-hydroxy- (MELDOLA and KUNTZEN), T., 2044.
- 1-Phenyl-3-methyl-2-isobutyl-6-benzimidazolone, 4,7-dinitro- (MELDOLA and KUNTZEN), T., 2043.
- α -Phenyl- α -methylbutylmalonic acid (INGLIS), T., 543.
- 1-Phenyl-4-methyl-3-*tert*-butyl-5-pyrazolone (WAHLBERG), A., i, 708.
- d*-Phenylmethylcarbinol, and the bucinic salt of the hydrogen succinate of (PICKARD and KENYON), T., 60.
- 1-Phenyl-4 methylcoumarone (ER and DECKE), A., i, 665.
- 2-Phenyl-4-methylcoumarone bromo-, and 1-nitro- (ST. DECKE), A., i, 665.
- 2-Phenyl-5 methylcoumarone, and 4-bromo-, and 1-bromo- (ER and DECKE), A., i, 665.
- Phenylmethyldiguanide (ST. DECKE), A., i, 629.
- Phenylmethyldihydroacridine (CYADO, KAUFMANN, W. ALBERTINI), A., i, 744.
- 5-Phenyl-10 methyldihydroacridine, 3,7-dibromo-, ethyl ester (CYADO, KAUFMANN, W. ALBERTINI, WIDMER, and A.), A., i, 749.
- α -Phenyl-3,4-methylenedioxyacetic acid (BODOUX), A., i, 784.
- 1-Phenyl-2-methyl-3-ethylbenzimidazolium hydroxide, 4,7-dihydroxy-, and its salts (M. KUNTZEN), T., 1237.
- 1-Phenyl-2-methyl-3-ethylbenzimidazol, 4,7-dinitro-6-hydroxy- (M. KUNTZEN), T., 1236.
- 1-Phenyl-3-methyl-2-ethyl-2-benzimidazol, 4,7-dinitro-6-hydroxy- (M. KUNTZEN), T., 1236.
- 1-Phenyl-2-methyl-3-ethylbenzimidazolone, 4,7-dinitro-6-hydroxy- (M. KUNTZEN), T., 1236.
- 1-Phenyl-3-methyl-2-ethyl-6-benzimidazolone, 4,7-dinitro- (M. KUNTZEN), T., 2041.
- Phenylmethylethylphosphine (MEISENHEIMER and LEHNER), A., i, 344.
- 1-Phenyl-3-methyl-2-ethylpyrazoline (*homantipyrazine*, thio-derivatives) (V. KOSER-NORWALD), A., i, 505.
- Phenylmethylethylsilicol (KIPPING and HACKFORD), T., 141; P., 9.
- 3-Phenyl-1-methylcyclohexan-3-ol, its phenylurethane (MAGRE and MURAT), A., i, 127.
- α -Phenyl- ϵ -methylhexan-7-one (DERENS), A., i, 303.
- 3-Phenyl-1-methylcyclohexan-3-ol, and MURAT, A., i, 127.
- Phenylmethylenitaconic acid, dimethyl esters (STOUBE and A.), A., i, 375.
- Phenylmethylenitaconic ester, preparation of (GADEMANN), A., i, 375.
- Phenylmethylketen and its (STAUDINGER and RUZICKA), A., i, 462.
- Phenylmethylketenquinoline (STAUDINGER and RUZICKA), A., i, 462.

11 Phenylphenonaphthasfluorene (POPE and HOWARD), T., 549.

Phenyl phenoxymethyl ketone, *p*-amino-, acetyl derivative (KUNCKELL), A., i, 999.

3 Phenyl 5 phenoxymethyl-oxazole (V. WALTHER and LUTER), A., i, 237.

4 Phenyl 3 phenoxymethyl-oxazolone, and 5-pheno-4-*p*-chloro-, V. WALTHER and HIRSCHL, A., i, 238.

3 Phenyl 6 phenoxymethylpyrazole (V. WALTHER and LUTER), A., i, 237.

Phenyl β -phenylenediamine, 2,4-dinitro-, and its hydrochloride (BOUSCHE and RANTSCHKE), A., i, 332.

Phenyl *p*-phenylenediamine, 4'-bromo-, and 4-chloro-, and their salts (BAMBERGER and HAM), A., i, 685.

α Phenyl β - α -phenylethyl β -ethyl hydrazine and its derivatives (WIELAND and FRIEDEL), A., i, 195.

Phenyl β -phenylethylmethylamine and its picrate and platinichloride (V. BRAUN), A., i, 35.

Phenylphosphordi-*p*-tolonide (KIPPING and CHALLENGER), T., 639.

Phenylphthalimides, isomeric (KUHARA and KOMATSU), A., i, 295.

Phenylpiperidine, 1-dinitro- (BOUSCHE and RANTSCHKE), A., i, 339.

8 Phenyl α -piperonylfulgenic acid (STORCK, KAUTSCH, and BADENHAUSEN), A., i, 376.

8 Phenyl α -piperonylfulgide (STORCK, KAUTSCH, and BADENHAUSEN), A., i, 377.

1 Phenyl 4 piperonylhydantoin, 2-thio- (JOHNSON and BRATFLECHT), A., i, 814.

1 Phenyl 4 piperonylidenehydantoin, 2-thio- (WHEELER and BRATFLECHT), A., i, 591.

Phenylpropionic acid, α -methylhexyl-carbinyl ester of (HILDITCH), T., 222; P., 6.

dl-, *d*-, and *l*-octyl esters of (PICKARD and KENYON), T., 67.

Phenylpropionamide, α -cyano- β -hydroxy- (SCLAVI), A., i, 398.

α -Phenylpropionanilide (STAUDINGER and RZICKA), A., i, 464.

8 Phenylpropionic acid, *d*-methylhexyl-carbinyl ester of (HILDITCH), T., 222; P., 6.

d- and *l*-octyl esters of (PICKARD and KENYON), T., 66.

8-Phenylpropionic acid, *dl*- α -amino-3:4-dihydroxy-, benzoyl derivative (FUNK), T., 556.

β -hydroxy- (β -phenylthiacyrylic acid), ether derivatives of (SCHRAUTH, SCHOELLER, and STRIENSEE), A., i, 641.

8-Phenylpropionic acid, α -ethyl ester, and its ENFABRIKES VOEM., A., i, 629.

d 8 Phenylpropionic hydroxy- (FRIEDLICH), A., ii, 521.

d-, and *l*-Phenylpropionic hydroxy-, ethyl ester (FARRER), T., 1921.

α Phenylpropionyl chloride, and α -chloro derivatives (RZICKA), A., i, 433.

Phenylpropylcarbinyl ether (DEL BOSCO), A., i, 44.

γ Phenylpropyldiethylamine picrate and picrate (BRAUN), A., i, 36.

γ Phenylpropylpropylamine picrate and picrate (BRAUN), A., i, 36.

γ Phenyl α - β -propylene-pyrazole-*p*-chloro- STORCK, A., i, 376.

γ Phenylpropylethylamine (A.), i, 36.

γ Phenylpropylethylcyanamide (BRAUN), A., i, 36.

α Phenyl α - β -propylethylamine (NEE), A., i, 999.

1 Phenyl 4- α -propylhydantoin (BRATFLECHT), A., i, 814.

Phenyl isopropyl ketone, properties and derivatives (WORTH and STEIN), T., 1921.

γ Phenylpropylmethylamine derivatives (V. BRAUN), A., i, 35.

Phenyl β - β -propylmethylamine (KUNKE), A., i, 999.

γ Phenylpropylmethylcyanamide (BRAUN), A., i, 35.

γ Phenylpropylpropylamine picrate and its picrate (BRAUN), A., i, 36.

γ Phenylpropylpropylcyanamide (BRAUN), A., i, 36.

γ Phenylpropyltrimethylamine bromide and its picrate (BRAUN), A., i, 35.

Phenylisopropyltrimethylamine hydroxy-, and *dl*-picrate (ROSENMUND), A., i, 43.

1-Phenylpyrazole, 2,3-dibromo-, 3-chloro-, 2,3-dibromo-, 4:5-dichloro-, 2,3-dibromo-, 3:4:5-trichloro-, 2,3-dibromo-, 3:4:5-trichloro- (MICHAELIS and WATSON), A., i, 1039.

1-Phenylpyrazole 3-carboxylic chloride, 4:5-dichloro-, 2,3-dibromo-, and their salts (MICHAELIS and WATSON), A., i, 1039.

- Phosphoric acid**, behaviour of uranyl salts of, with indicators (STARKENSTEIN), A., ii, 537.
- absorption of, by plants (PERIFFER and BLANK), A., ii, 764.
- analysis (TOFFET and CHOCHAK), A., ii, 145.
- fraction of, in soils (PRILL), A., ii, 149.
- influence of various salts on the assimilation of (PRIANISCHNIKOFF), A., ii, 432.
- precipitation of phenyl barium and phenyl ammonium salts (EPHRAIMI), A., i, 285.
- precipitation of salts of (KIPLING and CHALLENGER), T., 630; P., 66.
- reduction of asymmetrical derivatives of (KIPLING and CHALLENGER), T., 626; P., 66.
- and chloro-, chlorotolyl esters of (RASCHE), A., i, 636.
- fraction of (WAGENAAR), A., ii, 961.
- estimation of (KRASER), A., ii, 331; (BANG), A., ii, 664; (SEIFERTER and SCHREFFER), A., ii, 768.
- estimation of, colorimetrically (TOFFET and CHOCHAK), A., ii, 123.
- estimation of, gravimetrically (V. LOFFENS), A., ii, 1028.
- estimation of, volumetrically (WUYIS), A., ii, 654; (RUSIN), A., ii, 768.
- estimation of, as magnesium ammonium phosphate (JORGENSEN), A., ii, 437, 536.
- estimation of, in the presence of vanadic acid (EIGAR), A., ii, 71.
- estimation of, in superphosphates and bone-meals (ROMANSKI), A., ii, 227.
- estimation of, in soils (KASPER and GHEISENGER), A., ii, 152.
- estimation of, colorimetrically, in soils (PASSERINI), A., ii, 535.
- estimation of, in steel (HINCHESON and DREHMANN), A., ii, 156.
- Phosphates**, influence of, on glycolysis (LOH), A., ii, 504.
- organic (BOESMAN), A., ii, 427.
- transformation of, in soils (STOKER and PARR), A., ii, 429.
- effect of soluble salts on the adsorption of, by soils (PATTEN), A., ii, 1128.
- fraction of, with intercalant chloride (SESE), A., ii, 537.
- analysis of, and conversion of, into superphosphates (HARDY and VANDORMAERE), A., ii, 331.
- Phosphoric acid**:
- Phosphates**, estimation of (HUNDENBERG), A., ii, 961.
- estimation of, refractometrically, in urine (AMANN), A., ii, 536.
- Phosphoric acids**, ortho-, meta-, and pyro (HOFF and MATES), T., 584; P., 21.
- physiological action of the (STARKENSTEIN), A., ii, 533.
- esters and amides of (LANGREID), A., i, 705.
- Orthophosphoric acid**, dissociation constants of (PEIDREAU), T., 1234; P., 121.
- condensation of acetone in the presence of (NEIGEL), T., 1249; P., 71.
- Metaphosphoric acid**, heat changes during the hydration of (BARRETT), A., ii, 798.
- velocity of hydration of (BARRETT), A., ii, 974.
- ethyl ester, compounds of, with alcohols and amines (LANSCHIED), A., i, 796.
- Metaphosphates**, alkali and meta-borates, fusion of mixtures of (VAN KROONSTEDT), A., ii, 110.
- Pyrophosphoric acid**, rate of hydration of (ATWOOD), A., ii, 108.
- Phosphorous acid**, kinetics of the reduction of mercuric chloride by (GARNER, FOGGESSON, and WILSON), A., ii, 973.
- ethyl ester (RASCHE), A., i, 636.
- Hypophosphites**, estimation of (RUPP and KNOTT), A., ii, 1133.
- Thiophosphoric acid**, α - and β - trimethyl esters and their derivatives (EMMETT and JONES), T., 713; P., 72.
- armino-, diphenyl ester, and its sodium and ammonium salts (EPHRAIMI), A., i, 285.
- Phosphoryl chloride** as a cytoscope solvent (GORDON and MANNESSIE), A., ii, 1060.
- reduction of, by hydrogen (BESSEN and FORNIER), A., ii, 37.
- interaction of, with metallic oxides (BASSETT and TAYLOR), T., 1402; P., 155.
- Phosphorus organic compounds** (ARLISOFF), A., i, 100.
- optically active (MEISENHEIMER and LUDWIGSHAF), A., i, 314.
- Phosphorus**, detection of, in cases of poisoning (PEIDREAU), A., ii, 438.
- electroscopic detection of, in the organic (SCHMIDT), A., ii, 616.

Phosphorus, estimation of, volumetrically (BOWSER), A., ii, 437.

estimation of, in iron, without separation of silicon (MELLER), A., ii, 1132.
estimation of, in meat (GRINDLEY and ROSS), A., ii, 332.

estimation of, in milk (BOEDAS and TOUPLAIN), A., ii, 438, 535; (FLEURENT and LEVI), A., ii, 535.

estimation of, in oils (FREY), A., ii, 535.

estimation of, in tissues (WOLF and OSTERBERG), A., ii, 57.

estimation of, in wines (DORMANE), A., ii, 931.

Phosphoryl chloride. See under Phosphorus.

Phosphotungstic acid, precipitation of (WECHLER), A., ii, 523.

Photochemistry :—

Light, chemical action of (CIAMICIAN and SILBER), A., i, 513, 647, 650; (INGHILLERI), A., i, 709.

classification of reactions influenced by (PLOTNIKOFF), A., ii, 834.

absorption of, by inorganic salts (HOUSTON; HOUSTON and BROWN), A., ii, 785; (HOUSTON and ANDERSON), A., ii, 786.

absorption of, by mixtures of substances (RUFF), A., ii, 237.

action of, on aldehydes and phenanthraquinone (KLEGER and ROERDANSZ), A., i, 633.

dispersion of, by vapours of the alkali metals (BEVAN), A., ii, 349.

action of, on chlorophyll (DANGEARD), A., ii, 86.

development of colours in fibres by (BAUMSCH), A., ii, 952.

refraction and dispersion of, in gases (GRUCHKE), A., ii, 349; (JULIUS and VAN DER PLAATS), A., ii, 449.

ionisation of gases by (CANNECIER), A., ii, 455.

influence of, on the composition of the sugar-beet (STROHMER, BRIEM, and FALLADA), A., ii, 763.

effect of, on sulphur insulation (BATES), A., ii, 836.

ultra-violet, intensity of, from quartz-mercury lamps (HENRI), A., ii, 833.

influence of, on chemical reactions (POUGNET), A., ii, 85.

measurements of photochemical action in (SCHALL), A., ii, 835.

conversion of stable stereoisomerides into labile modifications by (STOERMER, FRIDERICI, BRÄUTIGAM, and NECKEL), A.,

PHOTOCHEMISTRY :—

Light, ultra violet, for disinfecting agents and action of, on various substances (CHLOPIS, A. GUNTZ and M.), 241.

action of, on (JOLLE; PIERRE, R. RANG; V. ELLER), A., i, 524.

action of, on chlorophyll and LAEGREID), A., i, 735.

action of, on diastase (A.), ii, 243.

action of, on enzymes (and MAZOTTI), A., ii, 246.

ionisation of gases by (A.), ii, 246.

nitrification by (GAUDECHON), A., ii, 170.

influence of, on (BERTELLO and A.), ii, 170.

photolysis of organic by (BERTELLO and CHON), A., ii, 56.

action of, on organic and metallic substances (and GAUDECHON), 242.

action of, on plants (A.), ii, 528.

effects of, on serum (A.), ii, 997.

decomposition of water (A.), ii, 452, 564.

Sunlight, organic synthesis of (PATERNO and CHON), 65; (PATERNO and A.), i, 66.

Photochemical investigation, occurrence near the surface (KEEON), A., ii, 834.

in aqueous solution (A.), ii, 681.

in gases, energy (BURCH), A., ii, 834.

in laboratory work (A.), ii, 66.

studies (PLOTNIKOFF), A., ii, 834.

synthesis of carbohydrates (LASA and ZIMMERMAN), 178; (LÖB), A., ii, 178.

Photokinetics of labile compounds (BRUNER and CAZENA), 241; (BRUNER and LA)

PHYS. CHEMISTRY.—

Photographic images, development of, from silver salts (LUMIERE; L. W. HALL and SEYFWEITZ), A., ii, 55.

Optical activity and chemical constitution (ISOLIS), T., 538; P., 46.
influence of double linking on (FRANKLAND and O'SULLIVAN), T., 2325; P., 319.

influence of aromatic position-isomerism (HILDEBRAND), A., i, 822.
relation of position isomerism to (COHEN), T., 1658; P., 123.

effect of contiguous unsaturated groups on (HILDEBRAND), T., 223; P., 6.

dispersion (HAYLOCK), A., ii, 165.
points on, Walden's (McKENNIE and BARLOW), T., 1910; P., 232;
(FISCHER), A., i, 418; (FISCHER and SCHREIBER), A., i, 527;
(SCHREIBER and WHEELER), A., i, 855.

scattering (WINSTON), A., ii, 236.

Optically active compounds, influence of the solvent on the rotatory power of (LANTIER), A., ii, 459.

Radiation, homogeneous, copious (LANTIER), A., ii, 839.

Rays, method of making visible the paths of, through a gas (WILSON), A., ii, 555.

engraved list, isolation of, by quartz (RUSSELL and SODDY), A., ii, 99.

• **Rays**, ionisation of gases by (MULLIN), A., ii, 171.

• **Particles**, distribution of (SKOW), A., ii, 682.

range of (GRIGER and NOTTAGE), A., ii, 953.

• **Rays** from radium and thorium v. BAYLEY HARRIS and MEDFORD, A., ii, 567.

production of γ rays from (GRAY), A., ii, 355.

• **Particles**, ionisation produced by (GARDNER and KOVARIK), A., ii, 754.

secondary (KATSONIKOFF), A., ii, 849.

variation of ionisation with velocity of the (WILSON), A., ii, 566.

• **and β Particles**, scattering of, by matter (HUTHERFORD), A., ii, 133.

• **Rays** of thorium and actinium (RUSSELL and SODDY), A., ii, 88.

secondary, produced by β -rays (GRAY), A., ii, 355.

PHYS. CHEMISTRY.—

• **, β , and γ Rays**, influence of, on colour of solids (PORTER and SIECK), A., ii, 174.

• **Rays** (CAMERON), A., ii, 841.

Canal rays, Kohnstamm and KILBING, A., ii, 86; (THOMSON), A., ii, 457.

in hydrogen, 10950 spectrum of (GUTHRIE and ROBINSON), A., ii, 166; (STARK), A., ii, 568.

chemical action of (PERMAN), T., 834; P., 314; (KILBING), A., ii, 684.

chemical action of, of various elements v. (DEBEND and HAMM), A., ii, 434.

ionisation of gases by (STIEGLER), A., ii, 928.

Cathode rays, chemical action induced by (LEMAN), T., 834; P., 314.

absorption and relation of (BUTLER), A., ii, 1046.

action of on metals (POCHINETTI), A., ii, 357.

chemical phenomena by (DORTER), A., ii, 569.

Röntgen rays, production of, characteristic (WILKINSON), A., ii, 568; spectrum of (BARKER), A., ii, 839.

ionisation of heavy gases by (BEATTY), A., ii, 245.

homogeneous secondary (CHAPMAN), A., ii, 557.

intensity of (CHAPMAN and GRAY), A., ii, 568.

energy transformations of (BROOK and PORTER), A., ii, 683.

Radioactive content of the tufa of Elzeul (PORTER and NORRIS), A., ii, 846.

Radioactive elements, fraction of (SCHALL), A., ii, 172.

decomposition of, at ordinary temperature (MARTIN), A., ii, 454.

Radioactive emanations, transformation in (RUTHERFORD and GILBERT), A., ii, 355.

Radioactive equilibrium (MITCHELL), A., ii, 87.

in Vesuvian columnite (ROSSI), A., ii, 174.

Radioactive minerals, ratio between uranium and radium in (GLEDITSCH), A., ii, 845.

from the Caracous (SOKOLOFF), A., ii, 485.

from Malagascari (LAUREIX), A., ii, 295, 296.

Radioactive products of short life (MULLIN), A., ii, 171.

PHOTOCHEMISTRY:—

- Radioactive recoil** (MAKOWER and RUSSELL, A., ii, 172).
- Radioactive rocks and minerals** (GOSSEL, A., ii, 174).
- Radioactive substances, concentration and isolation of** (EHLER and FELLNER, A., ii, 957).
- variation in the activity of, with time (CURIEL, A., ii, 1047).
- heat produced by (D'ANE, A., ii, 358).
- Radioactivity, apparatus for measuring** (V. WESZELASKY, A., ii, 453; (SZILARD, A., ii, 565).
- units of measurement of (JABON, A., ii, 8).
- as a property of matter (WELF, A., ii, 709).
- influence of temperature on induced (SARASIN and TOMMASINA, A., ii, 244).
- local atmospheric, probable influence of soil on (SANDESON, A., ii, 818).
- and enzyme action (V. KÖRÖSY, A., ii, 9).
- of gases from the sulfoni of Larderello, concentration of (FORLEZZA and NORZI, A., ii, 842).
- of Leinster granite (FLETCHER, A., ii, 89).
- of igneous rocks from Antarctic regions (FLETCHER, A., ii, 570).
- of mineral springs. See under Water.
- Refraction constants, theory of** (WIENER, A., ii, 557).
- Molecular refraction of organic compounds, influence of three- and four-membered carbon rings on** (ÖSTLING, P., 316).
- Refractive index of binary mixtures** (MAZZUCHELLI, A., ii, 781).
- of halogen salts of the alkali metals (BAXTER, BOYLSTON, MUELLER, BLACK, and GOODE, A., ii, 557).
- Refractivity, relation between density and magnetic rotation of solutions** (SCHWERS, A., ii, 92).
- Atomic refractivity** (EISENLOUGH, A., ii, 81).
- Electrical double refraction of organic compounds** (LEISER, A., ii, 563).
- Magnetic double refraction of the rare earths** (ELIAS, A., ii, 81).
- Magnetic rotation, relation between, refractivity and density of solutions** (SCHWERS, A., ii, 92).
- Molecular rotation in normal homologous series** (HILDITCH: CHRISTOPHER and HILDITCH, P., 311).

PHOTOCHEMISTRY:—

- Rotatory dispersion** (T. A., ii, 450, 787).
- anomalous (ELIAS, A., ii, 352).
- natural and magnetic (A., ii, 352).
- Rotatory power and rotation** (PICKARD, T., 45; P., 324; H., 218, 224; P., 6).
- of optically active substances (A., ii, 459).
- Micro-polarisation** (FISHER, A., ii, 85).
- Spectra, origin of** (677; (STARR, A., 1042).
- of gases (DONATI, 1042).
- separation of, in (STEAD, A., ii, 104).
- of hydrocarbons (MEUNIER, A., ii, 67).
- absorption (EYDMAN, STEWART and W., 1043).
- of open chain and compounds (WRIGHT, and RAY, P., 153).
- influence of conjugation on (WRIGHT, and G., T., 451; P., 46).
- relation between, and (BRÜNING, 562).
- of halogen derivatives and toluene (P., 218).
- of derivatives and 1:2-diketo- Δ^3 - α - β - γ - δ - ϵ - ζ - η - θ - ι - κ - λ - μ - ν - ξ - \omicron - π - ρ - σ - τ - υ - ϕ - χ - ψ - ω (P., 167).
- of hydrocarbons and their derivatives (STORRE and H., ii, 561).
- of metallic ions, relation and their valency (P., 68, 328).
- of permanganate (P., 637; P., 66).
- of salts as affected by reagents (STRONG, A., ii, 167).
- of sulphur compounds (A., ii, 560).
- and fluorescence, influence of temperature and magnetic field (DU BOIS and ELIAS, 832).
- anode and cathode, of vapours (STEAD, A., ii, 104).

PHYSICAL CHEMISTRY:—

- Spectra**, arc, effect of pressure on (DEFFIELD, A., ii, 350).
- Heat, energetics and chemistry of (STARK, A., ii, 783).
- Dissociation, of solid stoichiometric substances (GOLDSTEIN, A., ii, 560).
- of the alkali metals in the glow discharge (GERHOF, A., ii, 83).
- of luminous gases (JUNGLOHANN, A., ii, 82).
- stellar, sequence of chemical forms in (LICKYER, A., ii, 82).
- ultra-violet absorption, of nitro compounds (ZEINSKY and ROSANOFF, A., ii, 1044).
- Spectral lines**, structure of, in weak magnetic fields (LUNELUND, A., ii, 217).
- Photographic images**. See under Photography.
- Phototropy and thermotropy**, studies in (SIEDEL and CLARKE, T., 2981; P., 29).
- Phthalene**, evolution of (MALOTTA, A., i, 980).
- Phthalanil**, imino, pyrimino, and thio (REISSER and HOLLER, A., i, 981).
- Phthalbromonitril**, bromomimino, and its nitrile (REISSER and HOLLER, A., i, 982).
- Phthalins**, spectrographic studies of the (MAYER and FISCHHO, A., i, 723).
- 6, 6'-bis-(3,5,3',5'-tetrahydroxydiphenyl) and their derivatives (MAYER and FISCHHO, A., i, 872).
- Phthalic acid salts**, composition of (MAYER and FISCHHO, A., i, 875).
- Phthalic acid**, acetyl, phthalyl, and phthalyl esters of, and their silver salts (WILHELM, MAYER, and HUST, A., i, 145).
- Carbonyl salt of (FREUND, A., i, 561).
- Trimethylbenzyl-, hydrogen, potassium β -butyl hydrogen, and bromine salts of (FICKARD and KENNEDY, T., 58).
- Yodium salt of (PRATT and JAMES, A., ii, 893).
- 2-hydroxy-, and its anhydride (ELLMASS and KOPETSCHEK, A., i, 292).
- Phthalic acid**, and 2-hydroxy-, and 2-amino-, methyl and ethyl esters and derivatives of (WOLFF and NAGEL-SCHMIDT, A., i, 58).
- Phthalic acid**, 4,6-diamino-, and its derivatives (ROGERS, A., i, 953).
- 2-oxo-, and its methyl ester (MAYER, A., i, 969).
- Phthaliminoacetophenone**, α -amino-, acetyl derivative (KUNCKEL, A., i, 990).
- Phthaliminobromoacetone** (GABRIEL, A., i, 645).
- Phthalimino- β -bromoacetone** (GABRIEL, A., i, 645).
- Phthalimino- γ -bromoacetone** (GABRIEL, A., i, 645).
- Phthalimino- δ -bromoacetone** (GABRIEL, A., i, 645).
- Phthalimino- α,β -dibromopropane** (GABRIEL, A., i, 645).
- Phthalimino- γ -butyric acid** and its chloride (GABRIEL, A., i, 212).
- Phthalimino- γ -butyric anhydride** (GABRIEL, A., i, 212).
- Phthalimino- γ -butyropenone** (GABRIEL, A., i, 212).
- Phthalimino- γ -butyryl bromide** (GABRIEL, A., i, 982).
- Phthalimino- γ -butyrylmaleic acid** (GABRIEL, A., i, 213).
- Phthaliminohydroxyacetone** (GABRIEL, A., i, 645).
- Phthalimino- α -hydroxybutyric acid**, and its lithium and calcium salts (FEDER and GORDON, A., i, 19).
- Phthaliminopimaric acid** (WIDMAN and WOLFF, A., i, 703).
- Phthaliminopropane**, α,β -dibromo- (GABRIEL, A., i, 982).
- Phthalimino- β,γ -propane** (GABRIEL, A., i, 645).
- Phthalimino- α,β -propane**, α,β -dibromo- (GABRIEL, A., i, 982).
- Phthaliminopropylene**, and bromine, dibromo-, and α,β -dibromo- (GABRIEL, A., i, 982).
- Phthalaceperinone** (SACHS and MOSKOWITZ, A., i, 961).
- 2,3-Phthaloyldiphenyl 3'-phthaloylo acid, 4,4'-dihydroxy (SCHOLL and SEEL, A., i, 558).
- 6,7-Phthaloyl-N-methylthiodiphenylamine 2-phthaloylic acid (SCHOLL, SEEL, and FREUND, A., i, 559).
- Phthaloylphenyl sulphide (SCHOLL and SEEL, A., i, 558).
- 2,3-Phthaloylthianthren (SCHOLL and SEEL, A., i, 557).
- Phthalyl- β -bromophenylhydrazide (CHATTAWAY and WUNSCH, T., 2260).
- Phthalyl- β -chlorophenylhydrazide (CHATTAWAY and WUNSCH, T., 2261).
- Phthalylhydrazides, polymorphic (CHATTAWAY and WUNSCH, T., 2253; P., 193).
- Phthalyl- α - and β -naphthylhydrazide (CHATTAWAY and WUNSCH, T., 2265).
- Phthalylphenylphenylhydrazide (CHATTAWAY and WUNSCH, T., 2264).

- Phthalylphenylmethylhydrazide** (CHAT-TAWAY and WUN-SH, T., 2261).
- Phthalyl-o, and p-tolylhydrazide** (CHAT-TAWAY and WUN-SH, T., 2259).
- Phyllocladene** (BAKER and SMITH), A., i, 479.
- Phyllohammin**, preparation of (MARCHLEWSKI and ROBEL, A., i, 735).
- Phylloporphyrin**, preparation of (MARCHLEWSKI and ROBEL, A., i, 552).
- Physiological action and chemical constitution** (EMDE, A., ii, 313; (HEBENK, A., ii, 515).
- Physiological fluids**, so-called, replacement of calcium in (BUGLIA), A., ii, 131.
- Physiological processes**, the optimum temperature for (VAN AM-TEL and VAN IJERSON), A., ii, 319.
- variation in temperature coefficients of (SNYDER), A., ii, 618.
- Physovermine** (SALWAY), T., 2152; P., 273.
- Phytadiene** (WILLSTATTER, MEYER, and HUNZ), A., i, 147.
- Phytane**, and *di-iodo*-, and *tri-hydroxy*-, (WILLSTATTER, MEYER, and HUNZ), A., i, 147.
- Phytanic acid** and its derivatives (WILLSTATTER, MEYER, and HUNZ), A., i, 146.
- Phytanol** and its derivatives (WILLSTATTER, MEYER, and HUNZ), A., i, 145.
- Phytase** in lower fungi (DOX and GOLDEN), A., ii, 1022.
- Δ^8 -Phytenic acid** (WILLSTATTER, MEYER, and HUNZ), A., i, 146.
- Phytin**, preparation of pure, and its physiological importance (STAEKENSTEIN), A., ii, 132.
- and its derivatives (VORBRDIT), A., i, 263.
- Phytochlorin** -e, -f, -g, and -i, and their salts and esters (WILLSTATTER and UTZINGER), A., i, 662.
- α - and β -Phytol** and their derivatives (WILLSTATTER, MEYER, and HUNZ), A., i, 144.
- Phytosterol**, $C_{28}H_{48}O$, and its derivatives from *Linaria vulgaris* (KLOBB and GARNIER), A., i, 972.
- $C_{27}H_{46}O$, from *Withania somnifera* (POWER and SALWAY), T., 493; P., 53.
- and its derivatives from *Tilia europaea* (KLOBB and GARNIER), A., i, 972.
- from bryony root (POWER and MOORE), T., 942; P., 118.
- from the root of *Lasiosiphon Meissnerianus*, and its acetyl derivative (ROGERSON), A., ii, 325.
- Phytosterols**, relations of (with SALOWSKI), A., i, 45.
- Phytosterols** KLOBB, A., i, 972.
- Phetyl ether** (WILLSTATTER, MEYER, and HUNZ), A., i, 145.
- Picea excelsa*, resin from (KIEPAL), A., i, 295.
- Picoline methonitrite** (NEWMAN), P., 208.
- a-Picoline**, betaine of, and (KIEPAL), A., i, 157.
- compound of, with carbonyl chloride, and auribromide (DEWEY), A., i, 915.
- Picolinic acid**, betaine of, and (KIEPAL), A., i, 157.
- Picolinic acid**, 3:5-dichloro-, and 3:5-dichloro-4-hydroxy-, and 3-or 5-hydroxy- (SEID), A., i, 221.
- a-Picolinium o-nitrochloride** (WALHINGER), A., i, 191.
- platinilumide (GRIFFER, BAUMANN, and OBERMAYER), A., i, 185.
- ruthenium-bromide and chloride (LEUCHS), A., i, 185.
- o-, m-, and p-Picraminobenzoic acid**, and their salts (CROOKER and THIEWS), T., 301; P., 22.
- Picric acid**, colour and metallic salts of (DREAFER), T., 204; P., 1.
- metallic salts of (KAST), A., i, 451.
- crystallography of metallic salts (BAUMHAUER), A., i, 451.
- dyeing with (V. GEORGIJEV), A., 537.
- sodium salt, solubility of, and of sodium salts (FISCHER and SZEWSKI), A., i, 163.
- compound of, with benzaldehyde (EVEREST and MCGOWAN), 1759.
- Picrotoxin** (ANGELICO), A., i, 1.
- Picrotoxinin** and its derivatives (VELLO), A., ii, 419.
- Picryl chloride**, additive compound of, with isopropyl alcohol (BOERIS), A., i, 290.
- o-Picrylamino-phenylmercaptan** (MANN and STEINBERG), A., i, 1.
- Piszochemical studies** (GOLIN, FINE, and EUWEN), A., ii, 24.
- Pigments**, cutaneous (DUNN), A., 307.
- from oxidation by bacteria (INSER), A., ii, 518.
- Pilocarpine**, physiological action (WATKINS), A., ii, 224.
- benzaldehyde and (MAYER), A., i, 224.
- p-Pimaric acid** from (KÖHLER), A., i, 295.

- Pinacolia derivatives** (RICHARD, A., i, 102; DELACREY, A., i, 102).
- Pinacolone** (LINDNER, A., i, 522).
- Pinacolin, α -bromo-, and α -cyano-** and potassium salt of the latter (WIDMAN and WÄHRBERG, A., i, 702).
- Pinacoly alcohol, derivatives of** (RICHARD, A., i, 7).
- Pinacolyl alcohol, catalytic hydrogenation of** (COUTURIER, A., i, 522).
- Pinacolylamine hydrochloride** (WIDMAN and WÄHRBERG, A., i, 703).
- Pinacolylphthalimido acid** (WIDMAN and WÄHRBERG, A., i, 703).
- Pinacone, quantitative dehydration of** (DELACREY, A., i, 347).
- Pinone and emide, products of hydrolysis of** (DELACREY, A., i, 339).
- Pinone, preparation of** (PARRY, T., 1559; P., 141).
- Pinacone, synthesis of** (PARRY, T., 1559; P., 141).
- Pinene dwarf. See *Pinus pumila*.**
- Pinene. See *Coniferae*.**
- Pinel gland, effect of injection of extract of, on blood pressure** (EYSTER and JORDAN, A., ii, 215).
- Pinene, catalytic isomerisation of** (ZELINSKY, A., i, 397).
- Pinenechloro oxime, action of** (Piperidyl-BUSCHKEFF, A., i, 313).
- Pinene nitrosoazide, two isomerides and their derivatives** (FORSTER and NEWMAN, F., 247; P., 19).
- Pinewood oil, detection of, in turpentine** (GRIMALDI, A., ii, 231).
- Pinewood tar, constituents of** (MUELLER, A., i, 597).
- Pinol nitrosoazide** (FORSTER and VAN GOTTREKEN, T., 2067).
- Pinolone, constitution and synthesis of** (WALLACH, A., i, 891).
- Pinophanic acid, synthesis of** (KOMPA, A., i, 612).
- Pinus bambolii*, constituents of the oil of** (ROBINSON, P., 247).
- Pinus parviflora* dwarf pine, constituents of the oil of the** (BÖCKEN and HAHN, A., i, 549).
- Pinicoline, preparation of aliphatic nitrogen compounds from** (V. BEAUX and SOHRECK, A., i, 413).
- Piperazine, 2,5-dithio-, and its metallic salts** (JONSSON and BURNHAM, A., i, 713).
- Piperidine, action of, on *d*-pinene chloro-oxime** (BUSCHKEFF, A., i, 313).
- Compound of, with carbon tetrachloride, and auribromide** (DERS and DEWEY, A., i, 314).
- nitrite** (NEGGI, T., 1599; P., 208).
- Piperidine methenitrite** (NEGGI, T., 1599; P., 208).
- Piperidylacetyl catechol and its hydrochloride** (MANNICH and HÖRNER, A., i, 568).
- Piperidylstyryl phenyl ketone** (ANDRE, A., i, 299).
- Piperil* 3 naphthylhydrazone** (PADUA and SANI, A., i, 694).
- Piperil* 3 tolyloxazone** (PADUA and SANI, A., i, 694).
- Piperine, salts and stannic salts of** (PFEIFFER, FRIDMANN, GOLDBERG, PLES, and SCHWABKOPE, A., i, 792).
- Piperonaldehyde, action of, on the sodium derivative of phenylacetone nitrile** (BOLTON, A., i, 783).
- Piperonaldehyde, methoxyphenylhydrazones** (PADUA and SANI, A., i, 692).
- Piperonyl* acrylic acid, α -cyano-, ethyl ester** (CLARKE and FRASER, A., i, 275).
- Piperonyl* acrylic acid and its derivatives** (STORBE, FRIDBERG, BRAUNBEAM, and NECKE, A., i, 297).
- Piperonyl* 33 dimethylfulgenic acid** (STORBE and LENZNER, A., i, 374).
- Piperonyl* 33 dimethylfulgide** (STORBE and LENZNER, A., i, 374).
- Piperonyl*ideneamino 2 acetyl α naphthol** (TOLLEY and CALDARELLI, A., i, 68).
- Piperonyl*idenehydrazoic acid** (WHEELER and HOLMAN, A., i, 490).
- Piperonyl*idene γ methylenedioxyphenylparaconic acid** (STORBE, VIDWIG, FICKERT, and REDERLIEN, A., i, 378).
- Piperonyl* δ methyl Δ^8 pentene $\gamma\delta$ -dicarboxylic acid** (STORBE and LENZNER, A., i, 374).
- Piperonyl* naphthoflavanone, 6-nitro-** (TOLLEY and CALDARELLI, A., i, 68).
- Piperonyl* 3 2 naphthyl-3 methylfulgide** (STORBE and LENZNER, A., i, 379).
- Piperonyl* 3 phenyl 3 methylfulgenic acid** (STORBE, GADEMANN, and ROSE, A., i, 379).
- Piperonyl* 3 phenyl 3 methylallofulgenic acid** (STORBE, GADEMANN, and ROSE, A., i, 379).
- Piperonyl* 3 phenyl 3 methylfulgide** (STORBE, GADEMANN, and ROSE, A., i, 379).
- Piperonyl* 3 phenyl 3-methylallofulgide** (STORBE, GADEMANN, and ROSE, A., i, 379).
- Piperonyl*oin, properties of, and its carbamide and thiocarbamide** (TOLLEY and SEMMEL, A., i, 66).

- 2-β-Piperonylpropionyl-α-naphthol, β-hydroxy-6'-nitro-, and its derivatives** (TORREY and CARDARELLI), A., i, 68.
- Pipette, automatic** (PERMIN), A., ii, 221.
- Pitchblende, rate of development of heat by** (POOLE), A., ii, 86.
- Pituitary body, effects of extracts of different parts of the** (MILLER, LEWIS, and MATTHEWS), A., ii, 217.
- absence of iodine from the (DENIS), A., ii, 746.
- effect of injury to the, on carbohydrate tolerance (GORESCH, CUSHING, and JACOBSON), A., ii, 745.
- possible vicarious relationship between the thyroid and the (SIMPSON and HUNTER), A., ii, 1112.
- Pivalic acid, anilide of** (SCHROETER), A., i, 506.
- Pivalophenone chloride** (SCHROETER), A., i, 505.
- Placenta, mature human, constituents of the** (KOELKER and SLEMONS), A., ii, 746.
- Plague, use of chromium salts in combating** (KORNIG), A., ii, 311.
- Plant, annual, conservation of salts by an** (ANDRÉ), A., ii, 141, 423; (MAZE), A., ii, 424.
- assimilation, mechanism of (USHER and PRIESTLEY), A., ii, 817.
- assimilation and respiration (BLACKMAN and SMITH), A., ii, 423.
- cells, albumin and tannin in (LOEW and BOKORNY), A., ii, 324.
- development, influence of aluminium and manganese on (STOKLASA), A., ii, 643.
- extracts, presence of catechol in (WHELDAL), A., ii, 318.
- organs, diffusion of salts through (ANDRÉ), A., ii, 760.
- respiration (ZALESKI and REINHARD), A., ii, 1021.
- action of salts on (REINHARD), A., ii, 141.
- action of stimulants on (IWANOFF), A., ii, 522.
- tissues, betaines in (SCHULZE and PFENNINGER), A., ii, 426.
- Plants, chemistry of** (KEEGAN), A., ii, 917.
- micro-chemistry of (TUNMANN), A., ii, 1022, 1023.
- action of ultra-violet light on (POUGNET), A., ii, 529.
- action of formaldehyde on (BOKORNY), A., ii, 1021.
- electromotive phenomena in (BRITISH ASSOCIATION REPORTS), A., ii, 817.
- Plants, oedema in** (ARMSTRONG), A., ii, 91.
- action of anaesthetics on (LEPECHKIN), A., ii, 91.
- action of methylene-blue on respiration and fermentation (PALLADIN, HUBER, and KORSAKOFF), A., ii, 91.
- death of, at low temperatures (RICHTER), A., ii, 61.
- genesis of alkaloids in (TAM), RAVENNA, A., ii, 761.
- production of amines (ZIN), A., ii, 323.
- influence of anaesthetics on coumarin-producing (A.), ii, 761.
- degradation of arginine (A.), ii, 1124.
- isolation of betaine from (A.), ii, 813.
- wandering of betaine in (A.), ii, 1124.
- function of the catalase (A.), ii, 813.
- formation of chlorophyll in (VERDE and LEBMESKE), A., ii, 424.
- influence of enzymes on the action of (LWOFF), A., ii, 641.
- assimilation of nitrogen by the (A.), ii, 819.
- role of nucleoproteins in (A.), ii, 819.
- relation of the odorous (A.), ii, 819.
- of, to plant metabolism (A.), ii, 819.
- absorption of substances by (A.), ii, 522.
- tolerance of, to boric acid (A.), ii, 142.
- calcium requirements of (A.), ii, 222.
- assimilation of carbon by (A.), ii, 642; (MAQUENNE), A., ii, 760.
- effect of chromium compounds (KORNIG), A., ii, 524.
- disinfection of (DANESI and F.), A., ii, 820.
- absorption of phosphoric acid (PFEIFFER and BLANK), A., ii, 529.
- effect of heating soil on the (FLETCHER), A., ii, 529.
- respiration enzymes of (ZALESKI), A., ii, 323.
- influence of various toxic compounds (SCHREINER), A., ii, 425.
- green, assimilation of carbon by (GRAFE), A., ii, 521.
- action of alcohols on (A.), ii, 522.

- Plants green, aldehyde in the leaves of** (FRANKS), A., ii, 524.
- action of gaseous formaldehyde on** (IRAPEL), A., ii, 818.
- action of insecticides from coal tar on** (MIRANDE), A., ii, 223.
- action of hydrolysable salts and colloids on** (GRÉGOIRE), A., ii, 422.
- assimilation of nitrogen by** (HUTCHINSON and MILLER), A., ii, 920.
- assimilation of atmospheric nitrogen by** (MANELLI and POLLACCI), A., ii, 759.
- glut and lower, increase in the activity of, by small amounts of poisons** (FRED), A., ii, 1123; (KOWH), A., ii, 1124.
- non-leguminous, relation of, to the nitrate content of soils** (LYON and RIZZELLI), A., ii, 1025.
- tropical, fats extracted from the fruits of** (HEBERT), A., ii, 819.
- water, estimation of the gaseous exchange of** (BLACKMAN and SMITH), A., ii, 423.
- detection of arbutin in** (TUSMANN), A., ii, 669.
- Plasma membrane, composition of the** (LEFSCHIKIN), A., ii, 817.
- Plastin formation** (RAKOZAY), A., i, 1050; (HENRIQUES and GRADBECK), A., ii, 595.
- Platinocyanides.** See under Platinum.
- Platinum, sodium chloride and mercury, reactions in the system** (FEERS), A., ii, 1095.
- double salts of** (GUTHRIE, BAIRDIEHL, and OBERMAIER), A., i, 32.
- stereoisomeric sulphanilic salts of** (KIEHMREUTHER), A., ii, 1098.
- Platinocyanides, crystallography of** (BACHMAYER), A., i, 431.
- Platinum, assay of** (STEINMANN), A., ii, 1035.
- separation of, and tin** (WOHLER and SPENGEL), A., ii, 338.
- Platinum triangle, substitute for the** (PENSER), A., ii, 269.
- Psain TURNBERG**, A., ii, 627; (BAIRDIEHL and STERN), A., ii, 719.
- Poison of fish, method of action of** (PRIENS), A., ii, 638.
- from tetraodon** (TAHARA), A., ii, 133.
- toad, reactions of** (BUFALINI), A., ii, 348.
- Poisons, increase in the growth of plants by small amounts of** (FRED), A., ii, 1123; (KOWH), A., ii, 1124.
- metallic, action of** (MULLER, SCHÖLLER, and SCHRAUTH), A., ii, 755.
- Poisons, mineral, destruction of organic matter in the detection of** (BRETFEAU), A., ii, 226.
- influence of, on the enzymes of blood** (DUSCHKE and JOELHAUER), A., ii, 756.
- Poisoning, cobra** (BANG and OVERSON), A., ii, 316.
- by oleic acid, behaviour of red blood corpuscles in** (SCHMINCKE and FELLAY), A., ii, 125.
- by oxalic acid** (SARVONAT and ROBINET), A., ii, 815.
- excitability of nerves in** (CHIHARI and FROTHINGHAM), A., ii, 1018.
- by phosphorus, changes in the liver in** (STEWART), A., ii, 315; (WOLGEMUTH), A., ii, 517.
- metabolism in** (FRANK and ISAAC), A., ii, 815.
- inefficiency of the suprarenals in cases of** (NEUBAUER and PARGES), A., ii, 637.
- by sewer gas** (DODDIE), A., ii, 221.
- Polarity.** See under Electrochemistry.
- Polonium, spontaneous charging of** (CAMERON), A., ii, 950.
- effect of electric and magnetic fields on the charging of** (HAUSER), A., ii, 685.
- intervals of emission of a particle of** (CURIE), A., ii, 1017.
- emission of gases by the particles from** (TAYLOR), A., ii, 351.
- is Polycide** (ROSENHEIM and WEINHEIMER), A., i, 109; (ROSENHEIM and PINSKER), A., i, 265; (ROSENHEIM and KOHN), A., ii, 116; (ROSENHEIM), A., ii, 612.
- Polybasite, formula of** (VAN HOHN), A., ii, 807.
- Polycinnamic acid and its esters** (LIEBERMANN and ZUFFA), A., i, 370.
- Polyhalite from Nancy** (DURFELD), A., ii, 295.
- Polymerisation and bleaching** (STORR and EBERL), A., ii, 452.
- Polymorphism and isomerism** (BILMANN), A., i, 367, 963; (CITSA and VEDCHITTY), A., i, 810; (STORR), A., ii, 970.
- Polypeptides, synthesis of** (HOPWOOD and WEIZMANN), T., 1577; P., 214; (ABDERHALDEN, CHANG, and WURM), A., i, 526.
- diethylated** (ABDERHALDEN and KAUFMANN), A., i, 528, 954.
- optically active, preparation of, from racemic compounds** (ABDERHALDEN and GEDDEH), A., i, 842.
- Polysperma fructuosa, chemistry of** (BAMBERGER and LANDSIEDL), A., ii, 920.

- Polysaccharides**, action of invertase on, derived from levulose (BOUQUELOT and BEIDEL), A., i, 512.
 colorimetric method of determining the molecular size of (WACKER), A., i, 355.
- Porcelain membranes**, permeability of (BARTELL), A., ii, 1072.
- Position isomerides**, aromatic, influence of molecular symmetry on optical activity of (HILDETHUN), A., i, 592.
- Position isomerism**, relation of, to optical activity (COHEN), T., 1058; P., 123.
- "Potash,"** history of (v. LIPPMANN), A., ii, 38.
- Potash bulb** (WATERS), A., ii, 153.
- Potash-salt deposits**, iron compounds in the (BOEKKE), A., ii, 293.
 distribution of borates in (BILTZ and MARCUS), A., ii, 1101.
- Potassium**, relation between chemical affinity and the photoelectric effects of (POHL and PRINGSHEIM), A., ii, 90.
 and sodium compounds, isomorphism of (SOMMERFELDT), A., ii, 38.
 and sodium salts, antagonism in the toxicity of (LOEB and WASTENEYS), A., ii, 420.
- Potassium salts**, radium content of (SARTERLEY), A., ii, 243.
 effect of, on the circulation and on muscle (MATTHESON), A., ii, 753.
 and sodium, action of, on water (BANERJEE), A., ii, 109.
- Potassium bismuthide** (VOURNASOS), A., ii, 405.
 bromide and cuprous bromide, thermal analysis of mixtures of (DE CESARIS), A., ii, 804.
 rhodobromide (GOLOUBKINE), A., ii, 45.
 cupric carbonates (PICKERING), T., 800; P., 55.
 hydrogen carbonate, action of, on soluble magnesium salts (NANTY), A., ii, 282.
 equilibrium between, and magnesium carbonate (NANTY), A., ii, 103.
 sodium carbonates (OSAKA), A., ii, 723.
 chlorate, ratio of the molecular weights of, and potassium chloride (STAHLER and MEYER), A., ii, 881.
 detection and estimation of potassium perchlorate in (SCHERINGA), A., ii, 153.
 perchlorate, detection and estimation of, in potassium chlorate (SCHERINGA), A., ii, 153.
- Potassium chloride**, ratio of the weights of potassium chloride and sulphate, transfer of elements with (MAKAY), A., ii, 77.
 influence of sodium chloride on the toxicity of (LOEB and WASTENEYS), A., ii, 517, 770.
 antagonism of salts of the rare earths to the action of (WASTENEYS), A., ii, 457.
 and sodium chloride in (SACK), A., ii, 635.
 platinumchloride, reduction of (FR), A., ii, 933.
 dichromate and iodide, reaction between (KESSEL and PIETHAFESA), A., ii, 187.
 fluoride, hydrates of (LOEB), A., ii, 458.
 hydroxide, preparation of alcoholic (GAZE), A., ii, 97.
 (MALFATTI), A., ii, 97.
 manganate, thermal (BAHR and SACKEL), A., ii, 101.
 nitrate, formation of, from (JANECKE), A., ii, 759.
 fused, specific conductivity of (ATKIN), A., ii, 1651.
 and sodium nitrates, heat of fusion of fused mixtures of (ZACH and SCHAGGER), A., ii, 157.
 nitrite (DONATH), A., ii, 759.
 permanganate, kinetics of oxidation of hydrogen on (JUST and KAVKA), A., ii, 339.
 oxidation of organic compounds (HETPER), A., ii, 339.
 ferric sulphate as a standard, titration of (MILLER and QUADRAT), A., ii, 936.
 ammonoplumbite (FRANKLIN), A., ii, 393.
 dibromo-, dichloro-, and disulphaminoplatinates (KREFFNER), A., ii, 1969.
 sulphate, copper sulphate and the system (MEERHUIS), A., ii, 380.
 mixed crystals of, with sulphate (SACKEL), A., ii, 635.
 acid sulphate (SPORTENBERG), A., ii, 392.
 lead sulphate, formation of (STED), A., ii, 856.
 persulphate, interaction of, with nitrate and its catalytic effect on the oxidation of organic substances (AUSTIN), T., 262; P., 21.
 barium orthothioantimonate (G. ZEL), A., ii, 980.

- Potassium barium orthothiocarbonate** (VIARDEL, A., ii, 801).
- Phosphate, hydrates of (Jo)**, A., ii, 153.
- Potassium organic compounds:—**
- azobenzene, conductivity of (GEBELSON, A., ii, 460).
 - azide, reduction of (LITOFF, A., i, 777).
 - basic action of formaldehyde on (FRANZEN, A., ii, 323).
 - basic action of hydrogen sulphide on (RUE, T., 658; P., 60).
 - benzoyl, isomeride of (BELLER and LUSABATINI, A., i, 430).
 - action of, with silver nitrate and ammonia of amines (GASTALDI, A., i, 185).
 - acid and ferro-cyanides, magnetic susceptibilities of (OALEY, A., ii, 224).
 - benzoyl, purification and analysis, control of (SCHROEDER, A., ii, 1143).
 - isopropylcyanohydrin (CAMET, A., i, 431).
 - nitrosulphitocyanide (CAMET, A., i, 431).
 - triamine formate (STÄHLER and BACHMAN, A., ii, 1097).
- Potassium, detection of (BOWSER, A., i, 1031).**
- estimation of (FRESENIUS and REINOLD, A., ii, 333).
 - estimation of, volumetrically (SHEDDEN, A., ii, 333; (BOWSER, A., ii, 1135).
 - estimation of, in urine (GREEN, A., ii, 155).
- Pot culture experiments (VOELCKEL, A., ii, 322).**
- Potential.** See under Electrochemistry.
- Powders, agglomeration of (SCHUYLEN, A., ii, 78).**
- smokeless, estimation of sulphur in (MARGREYNATH, A., ii, 774).
- Praseodymium ammonium molybdate** (GARNER, A., ii, 291).
- Pr. Alum nitrate (JANISCH and WILHELM, A., ii, 115).**
- sulphide and oxysulphide (BILIZ, A., ii, 391).
- Precipitates, agglomeration of (HELDKES, A., ii, 190).**
- colloidal appearance of (BARDACH, A., ii, 59).
 - washing of (SCHERINGA), A., ii, 765.
- Precipitation, coefficient of (PAWLOFF, V. WEIMARS, A., ii, 201).**
- apparatus for, in an inert gas (FIELD and MYERS, P., 96).
- Precipitin reaction (WELSH and CHARMAN, A., ii, 809).**
- Preserves, estimation of copper in (LAKES, A., ii, 771).**
- Pressure, apparatus to vary (VIDMERS), A., ii, 594.**
- constant, apparatus for the maintenance of (WAIN and MERRIMAN), T., 984; P., 64.
- Pressure gauge, influence of water vapour on measurements in a McLeod (GICHARD, A., ii, 582).**
- Proline, formation of, in digestion of gluten (FISCHER and LONDON, A., ii, 905).**
- estimation of (VAN STYKE), A., ii, 780.
- Propylglycineanhydride, formation of (LEVIN, A., i, 97).**
- Propaldehyde bisulphite (MAYER), A., i, 253.**
- Propaldehyde, and thionine, condensation of, with malonic acid (LESPIRAT), A., i, 106.**
- Propane, isobutylidene, synthesis of (ROSENKEN and FRIS, A., i, 173).**
- adyltrivane (THOR and THORPE), T., 1052.**
- prop. Propane isobutylene derivatives (MONTANA, A., i, 62, 459).**
- prop. Propanecarboxylic acid, action of the cyanohydrin of, on benzene in presence of aluminium chloride (KUNZEL, A., i, 989).**
- prop. Propanedicarboxylic acids, conversion of substituted paracane acids into (VIERTEL and LOEQUIN, A., i, 722).**
- prop. Propanepentapentane-1:1)-aspiran-2:5 dione 3:4 dicarboxylic acid, and its ethyl ester (HÄDELSTET), A., i, 158.**
- Propane $\alpha\beta$ tricarboxylic acid (BLAISÉ and GAULT, A., i, 529).**
- prop. Propenyl 2-cyclobutanone, and its derivatives (LEHMEFF), A., i, 775.**
- prop. Propenylphenol (PAUL, V. BUTLER, and LOCKEMANN, A., i, 785).**
- Propenylphthalamic acid (JOHNSON and JOYCE, A., i, 455).**
- Propenylphthalimide (JOHNSON and JOYCE, A., i, 455).**
- Propiolamide (MOORE and BONGRAND), A., i, 22.**
- Propionamide, α nitro, and its ammonium salt, and α -bromo- α -nitro, and α -chloro- α -nitro (STEINROFF and STERN, A., i, 4).**
- Propionatochromo base, salts of a green and of a violet (WEINLAND and BORN, A., i, 104).**
- Propionic acid, α -bromo, α - and β -chloro, and α -bromo menthyl esters (COHEN, T., 1064).**

- Propionic acid, α -nitro**, and its salts (STEINKOPF and SUPAN), A., i, 4.
- dl*-**Propionyl-*dl*-alanine, α -iodo**, and its ethyl ester (ANDERHALDEN, HIRSCH, and GUGGENHEIM), A., i, 954.
- dl*-**Propionylglycine, α -iodo**, and its ethyl ester (ANDERHALDEN, HIRSCH, and GUGGENHEIM), A., i, 954.
- 3 Propionylindole** and its derivatives (ODDO and SESAN), A., i, 487.
- p*-**Propionylphenylcarbamide** (KENCHEL), A., i, 990.
- Propiophenone, *p*-amino**, and its derivatives (KENCHEL), A., i, 990.
- Propiophenone 4:5-dimethyl ether, 2:4:4-trihydroxy-** (BARGELLINI), A., i, 305.
- a*- and *b*-**Propoxyinnamamide** (STORMER, FRIDERICI, BRAUTIGAM, and NECKEL), A., i, 296.
- a*- and *b*-**Propoxyinnamic acid** (STORMER, FRIDERICI, BRAUTIGAM, and NECKEL), A., i, 296.
- b*-**Propoxyphenylpropionic acid**, (STORMER, FRIDERICI, BRAUTIGAM, and NECKEL), A., i, 296.
- β -Propoxy- β -phenylpropionic acid**, (SCHRAUTH, SCHUELLER, and STRENGER), A., i, 642.
- m*-**Propoxy- β -phenylpropionic acid** (FAHRENFADENKUN VONM. F. BAYER & Co.), A., i, 865.
- β -Propoxypropionic acid, propyl ester** (PALOMAA and KILPI), A., i, 176.
- iso*-**Propyl alcohol**, boiling points of aqueous solutions of (DOROSCHESKY and POLJANSKY), A., i, 253.
- Propyl ether, monochloro**, β -chloro-, α , β -dibromo-, and tetrachloro-, and their derivatives (ODDO and CUSMANO), A., i, 942.
- β -*iso*Propyl- γ -acetylbutyric acid** and its semicarbazone and oxime (WALLACH), A., i, 310.
- β -*iso*Propyladipic acid** (WALLACH and CHALLENGER), A., i, 472.
- Propylallylmalonic acid, β -hydroxy**, and its silver salt (JOHNSON and HILL), A., i, 503.
- Propylamine peroxide**, preparation of (KROVSKI and NISENMANN), A., i, 608.
- Propylaminoacetic acid, menthyl ester** (FRANKLAND and O'SULLIVAN), T., 2336; P., 319.
- Propylammonium telluri-bromide** and -chloride (GUTHRIE, FLURY, and MICHELER), A., i, 182.
- nitrite (RÄY and RAKSHIT), P., 291.
- n*- and *iso*-**Propylammonium osmichloride** (GUTHRIE and MAISCH), A., i, 19.
- iso*-Propylammonium** -ruthen- and -chloride (GUTHRIE and LEUBS), A., i, 183.
- telluri-bromide and -chloride (GUTHRIE, FLURY, and MAISCH), A., i, 182.
- 2-*n*-Propylanthranol-9** (POTSCHWAUSCHEG, and LENKO), A., i, 1093.
- 2-*n*-Propylanthraquinone, α : β : γ -tri-iodo**, and tri-iodo- (POTSCHWAUSCHEG, and LENKO), A., i, 1095.
- 2-*iso*-Propylanthraquinone, α : β : γ -tri-iodo**, and tri-iodo- (POTSCHWAUSCHEG, and LENKO), A., i, 1099.
- 2-*n*-Propylanthrone-9** (POTSCHWAUSCHEG, and LENKO), A., i, 1099.
- 2-*iso*-Propylanthrone-2** (POTSCHWAUSCHEG, and LENKO), A., i, 1099.
- Propylbenzene, equilibrium** of antimony trichloride (MAYR), A., i, 532.
- d*-**Propylbenzene, α -chloro** (and KENYON), T., 71.
- 4-*n*-Propylbenzophenone-2'-carboxylic acid** (SCHOLL, POTSCHWAUSCHEG, and LENKO), A., i, 1098.
- 4-*iso*-Propylbenzophenone-2'-carboxylic acid** (SCHOLL, POTSCHWAUSCHEG, and LENKO), A., i, 1098.
- cyclo*-Propylbenzylamine** and -hydrochloride (KILNER), A., i, 989.
- 4-*iso*-Propylbenzylidenetherodanone-3-nitro** (PIZZETTI), A., i, 622.
- 1-*iso*-Propyl-2-*cyclo*butanone semicarbazone** (LEBLONC), A., i, 775.
- cyclo*-Propylbutylcarbinol** (MICHELIS), A., i, 63.
- cyclo*-Propyl-*iso*butylcarbinol** (MICHELIS), A., i, 63.
- cyclo*-Propylbutylcarbiol** (MICHELIS), A., i, 63.
- cyclo*-Propyl butyl ketone** (MICHELIS), A., i, 63.
- cyclo*-Propyl isobutyl ketone** (MICHELIS), A., i, 63.
- iso*-Propylcarbamidecarboxylic ethyl and methyl esters** (MICHELIS), A., i, 358.
- cyclo*-Propylcarbinol** and -hydrochloride (MICHELIS), A., i, 63.
- cyclo*-Propylcarbinyl ethyl ether** (MICHELIS), A., i, 64.
- cyclo*-Propyl chloromethyl ether** (MICHELIS), A., i, 63.
- n*-Propyl- β -chloropropylene** (ODDO and CUSMANO), A., i, 487.

- Propylcoumaric acid.** See *o*-Propoxy-
coumaric acid.
- Propylcoumarinic acid.** See *o*-Propoxy-
coumarinic acid.
- Propyldimethylcarbinol.** trans-
isomers of (KJNER and KLAWIKORIOFF), A., i, 635.
- Propyldiphenylmethane 2' carb-
oxylic acid** (SCHOLL, POISCH-
WOLSKOFF, and LENKOWSKI), A., i, 1008.
- Propyldiphenylmethane 2' carb-
oxylic acid** (SCHOLL, POISCH-
WOLSKOFF, LENKOWSKI, and BOCKERT),
A., i, 1009.
- Propylenediammonium anti bromide and
chloride** (GUTHRIE and MAISON),
A., i, 19.
- Propylethylpropylcarbinol and its
isomers** (MICHELSEN), A., i, 63.
- Propylhydroxyrautinine and its
salt** (LEBER and LEDERER), A., i,
27.
- Propylhydroxyrautinine and its
salt** (LEBER and LEDERER), A., i,
27.
- Propylenecyclohexane, β -chloro, and
 β -1,1-dibromo** (ORD and CLIMANCO),
A., i, 943.
- Propylenetetramethyl-
aminodiphenylmethane** (LENGUE),
A., i, 309.
- Propylalonylbenzidine** (REMERY), T.,
i, 612.
- Propylalonylmalonamide** (REMERY),
T., i, 613.
- Propyloranthranol, β -bromo, brom-
ide, and $\alpha\beta$ -dibromo** (KONDO),
A., i, 67.
- Propylpentan-3-one and its
isomers** (WALLACH and CHAL-
LONER), A., i, 472.
- Propylphenol, 2,6-diamino, and its
diastyl derivative, and 2,6-dinitro,
and their derivatives** (THOM and
BROCKHOFF), A., i, 716.
- Propylpropionic acid, α -hydroxy**
KJNER and KLAWIKORIOFF, A., i,
- Propylpropylcarbinol, rotation of
isomers** (KENYON), P., 321.
- Propyl- Δ^2 -propylene** (KJNER and
KLAWIKORIOFF, A., i, 635).
- Propyl propyl ketone** (MICHELSEN),
A., i, 63.
- Propylpyridinium salts** (DECKER,
KAFFMANN, SASSER, and WISLOKI),
A., i, 1024.
- Propyl 2 pyridone** (DECKER, KAFF-
MANN, SASSER, and WISLOKI), A., i,
1024.
- 1-Propylpyrrolidine and its salts
(v. BUAEN), A., i, 563.**
- 2-Propylquinoxaline 3-carboxylic acid,
ethyl ester** (WALL), A., i, 109.
- Protease from bacteria** (MEYER), A., i,
511.
- Protein formation in ripening seeds**
SCHULTZ, A., ii, 322.
- coagulation, relationship between
muscular rigor and** (ROSSI), A., ii,
812.
- in case of, during the fattening of
pig grown animals** (PROFFER and
FRISKE), A., ii, 504.
- Bence-Jones, formation** (HOPKINS and
SAVOY), A., ii, 417.
- of plasma formation of, by yeasts and
molds** (HUBER), A., ii, 1122.
- metabolism.** See under Metabolism.
- Proteins, general chemistry of** (Mc-
CHARLES and ROSS), A., i, 99.
- in Egyptian mummies** (APPELHAUSEN
and WEIT), A., ii, 630.
- electrochemistry of** (ROBERTSON), A.,
i, 91, 196, 197, 194; ii, 490.
- isoleucine, constants of** (MICHAELIS
and DAVIDSON), A., ii, 192.
- refractive indices of** (ROBERTSON), A.,
i, 341; (ROBERTSON and GLENN),
A., i, 339.
- heat coagulation of** (SORENSEN and
JURGENSEN), A., i, 165; (CHICK
and MALLIN), A., i, 822.
- biochemical classification of** (ROD-
ERICKS), A., i, 90.
- digestion of** (VAN SLYKE and WHITE),
A., ii, 623.
- digestion of, in the dog fish** (VAN
SLYKE and WHITE), A., ii, 624.
- fixation of acids by** (KING), A., i,
196.
- partial hydrolysis of** (CARBERGHALDEN),
A., i, 580; (LEVEN, VAN SLYKE,
and RICHARDS), A., i, 822.
- cleavage of, in the alimentary canal**
(CARBERGHALDEN, KLEINSMANN, and
FALLERBERG), A., ii, 508.
- cleavage products of, in expired air**
(WEICHAEDT), A., ii, 993.
- action of bacteria on** (BAINBRIDGE),
A., ii, 1123.
- action of the Bulgarian ferment on**
(BRELAND), A., ii, 110.
- influence of catalytrates on the
spring of, in incubation** (WIMMER),
A., ii, 1993.
- action of intestinal juice on the pro-
ducts of digestion of** (LONDON;
LONDON and SOLOWEY), A., ii,
1090.
- precipitation of** (VANDERVELDE), A.,
ii, 630.

- Proteins**, precipitation and coagulation of (ROBERTSON), A., i, 695.
 precipitation of, by zinc sulphate (LIPPICH), A., i, 934.
 regeneration of, in the stomach (GLAGOLEFF), A., ii, 625.
 compounds of, with inorganic acids and bases (ROBERTSON), A., i, 993.
 of blood-serum (BEKIN), A., ii, 741.
 animal, action of, on vegetarians (ALBERTONI and ROSSI), A., ii, 411.
 in the ovary of fish (McCRUDEN), A., ii, 415.
 of living muscle, reactions between chemical compounds and the (VRELY), T., 180; P., 3.
 of milk (VANDERVELDE), A., i, 91; (BAUER and ENGEL), A., ii, 307.
 of wheat and barley, utilisation of (MENDEL and FINE), A., ii, 1109.
 sulphur in (JOHNSON and BURNHAM), A., i, 696; (JOHNSON), A., i, 753.
 iodo- (WHEELER and MENDEL; NEUBERG), A., i, 97.
 preparation of 3:5-di-iodotyrosine from (OSWALD), A., i, 203, 372.
 detection of (ABDERHALDEN and SCHMIDT), A., ii, 674.
 detection of, with the biuret reaction (KANTOR and GIES), A., ii, 554.
 diacetyl reaction for (HARDEN and NORRIS), A., i, 583.
 Liebermann's reaction for (ALBERDA VAN EKENSTEIN and BLANKSMA), A., ii, 554.
 analysis of (VAN SLYKE), A., ii, 944.
 identification and estimation of, in honey (MOREAU), A., ii, 347.
 estimation of (WESTHAUSE), A., ii, 674.
 estimation of, in milk (RICHMOND), A., ii, 236.
 estimation of the amide nitrogen in (DENIS), A., ii, 163.
Proteoses (ZUNZ), A., i, 1050.
Proteosomes, formation of, by caffeine (BOKORNY), A., ii, 142.
Proteus vulgaris, biochemistry of (HERTER and TEN BIGGEEK), A., ii, 758.
Protocatechnaldehyde, salts and derivatives of (PAULY, SCHÜBEL, and LOCKEMANN), A., i, 788.
 dimethyl mercaptal and *di-p*-nitrobenzyl mercaptal (PAULY, V. BUTTLAR, and LOCKEMANN), A., i, 786.
cyclocarbonate and its derivatives (PAULY, SCHÜBEL, and LOCKEMANN), A., i, 787.
Protocatechnaldehyde-*m*-carboxylic acid, methyl ester (PAULY, SCHÜBEL, and LOCKEMANN), A., i, 787.
Protocatechnaldehyde-*m*-carboxylic acid (PAULY, SCHÜBEL, and LOCKEMANN), A., i, 787.
Protosyringins, effect of, on the nerve (WALLER), A., ii, 1.
Protozoa, biochemistry of (PAULY), A., ii, 813.
Prussian blue, constitution of (A.), i, 618.
 composition of (MULLER, TREADWELL, and DUBOIS), A., i, 844.
Pulegonolide and its reduction (WALLACH and MEYER), A., ii, 1023.
Pulsoglyoxaline and its reduction (KJENSEN and ZAVARZINSKY), A., i, 1023.
Pamilon and its semicarbazone (A.), i, 559.
Pump, automatic mercury (A.), ii, 105.
 modified Boltwood (A.), i, 263.
 Geryk air, application of, to distillations (DOBY), A., ii, 480.
 suction-pressure (LIEBERMANN), A., i, 597.
 water, safety-valve for (A.), ii, 714; (BEHREND), A., ii, 714.
Purine metabolism. See **amino acid** metabolism.
Purine, 3-amino- derivatives (A. & Co.), A., i, 597.
Purines (JOHNS), A., i, 214.
Purine diuresis, excretion of metals in (BOCK), A., ii, 1023.
Pyknometer, new (V. KERN), A., i, 967.
Pyramidone, detection of (A.), ii, 777.
 ψ -Pyramidone (modified *pyrrole*) (MICHAELIS, GRAVE, and BOIE), A., i, 231.
Pyranthrone vat dyes (SCHÜBEL), A., i, 656.
Pyrazine derivatives, preparation of (LANGE), A., i, 565.
1:2-Pyrazinoanthraquinone, synthesis of (thraquinolinequinone) (LIVERANI), A., i, 929.
Pyrazolones, syntheses of (A.), A., i, 929.
Pyrazolone dyes, preparation of (A.), A., i, 929.
5-Pyrazolone-3-carbamoyl, imino-, methyl ester (A.), A., i, 462.
5-Pyrazolone-3-carboxylamide, imino-, and its ammonium salt (A.), A., i, 462.
5-Pyrazolone-3-carboxyloxazone, oximino-, and its derivatives (A.), A., i, 462.

- Pyrazolone 3-carboxybenzoylhydrazide** (BERTHO and GUCKEL), A., i, 165.
- Pyrazolone 3-carboxylohydrazide and 3-carboxylidene derivative** (CEHLIS and KELL), A., i, 402.
- Pyrazonanthrone** (ULMANN and VAN DER HAACK), A., i, 165.
- Pyrazole**, action of, on blood pigment (KATZ and ZEYNEK), A., i, 95.
- Pyrazole nitrate**, equilibrium in the system (WALTON and JUDDO), A., ii, 565.
- Pyrazole**, compound of, with carbon tetrabromide and anhydride (DEHN and JEWEL), A., i, 914.
- Pyrazole**, compound of copper benzoate and (KATZ), P., 94.
- Pyrazole**, compounds of organic salts of bivalent metals with (GROSSMANN and KATZ), A., i, 944.
- Pyrazole**, compounds of, with tin halides (FRIEDER, FRITTMANN, LEHN, and FRIEDENSTEINER, FRIDE, and SCHNEIDER), A., i, 746.
- Pyrazole**, polymorphism of (HARTZSCH), A., i, 673.
- Pyrazole** (Nelson), T., 1699; P., 745.
- Pyrazole**, plates, metallic (BUEHLER and KATZ), A., ii, 889.
- Pyrazole**, derivatives of (SELL), T., 1679; P., 220.
- Pyrazole**, estimation and estimation of ammonia (BUEHLER and SOBEL), A., ii, 565.
- Pyrazole**, amino-, synthesis of derivatives of 1,8-naphthylidine from (KATZ and TAMMUN), A., i, 167.
- Pyrazole**, and 3,5-dibromo-, methiodide (DICKER, KATZMANN, SASS, and WISLOCKI), A., i, 1921.
- Pyrazole**, monochloride (REITZENSTEIN and BREISING), A., i, 226.
- Pyrazole**, 3,5-dibromo-, 3,5-dichloro-, 1,8-bis-, and 4,5-dichloro-3,5-bis- (SELL), T., 1681; P., 221.
- Pyrazole ring**, rupture of the (REITZENSTEIN and BREISING), A., i, 225; KATZ and HAYER, A., i, 399.
- Pyrazole series**, pseudo-bases of the (KATZ), A., i, 485.
- Pyrazole**, nitride, preparation of (Nelson), T., 1254; P., 71.
- Pyrazole**, nitride (GUTHRIE and WALTON), A., i, 161.
- Pyrazole**, bromide (GUTHRIE, RAYRIEDEL, and OFFENBACHER), A., i, 33.
- Pyrazole**, bromide and chloride (GUTHRIE and LUCAS), A., i, 183.
- Pyridineanthraquinone**. See 2-Ant-raquinolanthraquinone.
- Pyridineanthraquinone**, acid and its salts (DUFFING), A., i, 81.
- Pyridineanthraquinone**, metallic (DUFFING), A., i, 565.
- Pyridylacetylacetic acid** and its hydrochloride (MANNICH and HURBER), A., i, 566.
- Pyridylacetylacetic acid**, hydrobromide (MANNICH and HURBER), A., i, 566.
- Pyrimidine** (JOHNSON and HILL), A., i, 562; JOHNSON, PECK, and AMBLER, A., i, 575; JOHNSON and AMBLER, A., i, 576; JOHNSON and SHEPARD, A., i, 224.
- Pyrimidine**, 5,6-diamino-, salts of (JOHNSON), A., i, 242.
- Pyrimidine**, 5-acetic acid, 2-thio-, and its ethyl ester (JOHNSON, PECK, and AMBLER), A., i, 576.
- Pyrimidine**, 5-carboxylic acid, 2-thio-, (JOHNSON and AMBLER), A., i, 576.
- Pyrites**, chemical constitution of (HENSEL), A., ii, 11; (FUMMER), A., ii, 901.
- Pyrites**, crystallography of (Pöschel), A., ii, 268.
- Pyrites**, from Hungary (LIEB), A., ii, 46.
- Pyrites**, estimation of arsenic in (HAFENSAUER), A., ii, 1928.
- Pyrites**, estimation of copper in (MAJEWSKI), A., ii, 335; (LWANG), A., ii, 660.
- Pyrogallol**, compound of, with p-benzoquinone (SCHMIDT), A., i, 654.
- Pyrogallol**, dibromo-, and tribromide (HEMMELMAYER), A., i, 984.
- Pyrogallolcarboxylic acid** (trimethyl ether, ethyl and butyl acid anhydride) (HARDING), T., 1787; P., 215.
- Pyrogallolcarboxylic acid**, monobromide, c. (HEMMELMAYER), A., i, 984.
- Pyrogallol** (trimethyl ether, 5-amino-, acetyl derivative) (HARDING), T., 1594.
- Pyrogallol**, 4,6-dibromo- and 4,6-dichloro- (THOMAS and STEELING), A., i, 721.
- Pyrolusite**, chemical constitution of (BENTLEY), A., ii, 11.
- Pyromellitic acid**, synthesis of (FEIST), A., i, 133.
- Pyromucic acid**, oxidation of (CHAVANNE), A., i, 796.
- Pyronone** synthesis (WEDERKIND, HAFENSAUER, WEISSWANG, and MILLER), A., i, 219.
- Pyrophosphoric acid**. See under Phosphorus.
- Pyrosols** (LORENZ), A., ii, 379.
- Pyroxene** (SMITH), A., ii, 501.
- Pyroxene minerals**, analyses of (SOMMER), A., ii, 992.

- Pyrrole** compounds, synthesis of, from imino-acids (JOHNSON and BENOIS), A., i, 564.
- Pyrrale**, nitro-, and its salts (ANGELI and ALBRANDI), A., i, 397.
- Pyrrale-2-carbanilide** (FISCHER and VAN SLYKE), A., i, 1020.
- α -Pyrralecarboxyl chloride** (FISCHER and VAN SLYKE), A., i, 1020.
- Pyrrale-2:5-dicarboxylic acid, 3:4-dichloro-** (COLACICCHI), A., i, 225.
- α -Pyrraleglycine** and its ethyl ester (FISCHER and VAN SLYKE), A., i, 1020.
- Pyrrale group**, synthesis in the (ODDO), A., i, 498.
- Pyrrale ring, 8-unsubstituted**, reactivity of (KÖNIG), A., i, 803.
- Pyrralidine ring**, stability of the (v. BRAUN), A., i, 583.
- splitting of, by bacteria (ACKERMANN), A., i, 808.
- Pyrralidone, 3-hydroxy-** (FISCHER and GÖLDERTZ), A., i, 20.
- 5-Pyrralidene-2-carboxylic acid**, esters and amide (FISCHER and BOEHNER), A., i, 455.
- Pyrric acid**, decomposition of, by ultra-violet light (EULER), A., ii, 452.
- lecture experiment to show the fermentation of (NEUBERG and KARCZAG), A., ii, 976.
- cetyl and phytanyl esters of (WILLSTÄTTER, MAYER and HÜND), A., i, 146.
- brucine salt (HILDITCH), T., 234.
- Q.**
- Quadrirates** (ROSENHEIM), A., i, 403; (KÖHLER), A., i, 690; (RINGER), A., i, 1044.
- Quartz**, specific heat of (LASCHTSCHENKO), A., ii, 253.
- optical characters of (RINNE and KOBBS), A., ii, 209.
- effect of pressure on the change of opal into (SPEZIA), A., ii, 497.
- Quartz-mercury lamps**, intensity of ultra-violet light from (HENRI), A., ii, 833.
- Quaternary systems**, composition of solid phases in (BELL), A., ii, 973.
- thermal analysis of (PARRAVANO and SROVICH), A., ii, 973, 1078.
- Quercetin**, amino-, and its salts (WATSON), P., 164.
- Quinaldine**. See 2-Methylquintoline.
- Quinaldinium bases** (VONGERICHEN and BOITA), A., i, 677.
- Quinazolines** (BOGERT, BELL, and AMEND), A., i, 162; (BOGERT, GORTNER, and AMEND), A., i, 580.
- Quindeline bromo-perbromide** (FICHTER and RÖHNER), A., i, 165.
- Quindolinecarboxylic acid** (FICHTER and STRUEN), A., i, 165.
- Quindolinium nitrite** and bromide (FICHTER and RÖHNER), A., i, 85.
- Quinhydrone**, preparation (MUNDS), A., i, 854.
- constitution of (RICHTER, A., i, 854; (KNORR), A., i, 854).
- Quinic acid**, cupric salts (T.), 177; P., 7.
- Quinidine**, action of sulphate (PFANNL; PANSEH), A., i, 484.
- hydrochloride, double salt with antimony pentachloride (A.), i, 484.
- Quinidine** and its salts (T.), i, 560.
- Quinine**, absorption spectrum (and FOX), P., 325.
- and its isomerides, absorption of (DOBIE and LARSEN), P., 148.
- action of sulphuric acid (and HOROWITZ), A., i, 111.
- and its derivatives, induction of trypanosome infection (ROTH and HALBERSTADT), ii, 219.
- excretion and estimation of (A.), ii, 1013.
- hydrochloride, double salt with antimony pentachloride (A.), i, 484.
- sulphate, mobility of in air during hydration (LIE and BRIZARD), A., i, 111.
- (DE BROGLIE), A., i, 837.
- ionisation and brightness produced by heating (LIE and BRIZARD), A., ii, 111.
- activity and luminescence (BROGLIE and BRIZARD), 837.
- benzaldehyde sulphite (A.), i, 224.
- diglycollic esters of (LIE and SÖHNE), A., i, 1011.
- distinction between, and (ASTRUC and CORBIN), A., i, 944.
- estimation of (COCKBURN), A., ii, 944.
- estimation of, in emulsion (VIGNERON), A., ii, 230.
- estimation of, volumetrically (KATZ), A., ii, 79.
- Quinine alkaloids**, estimation (JAVILLIER and GILBERT), ii, 778.

- Quinone esters of phenylarsonic acid** derivatives (OSCHMIDT), A., i, 760.
- Quinoketene** attempts to prepare (STAUDINGER and CLAR), A., i, 638.
- Quinol**, course of chemical change in, under the influence of radiant energy (HARTLEY and LITTLE), T., 1079; P., 137.
- Quinol**, copper compound of (THOMPSON), P., 155.
- Quinol**, compound of, with phenazine (ZERNIKOFF and V. OSTROMINSKY), A., i, 849.
- Quinol**, butyl ether, nitration of (NIELSEN and KESSELER), A., i, 39.
- Quinol**, ethyl ether, dinitro-, constitution of (REYERIN and DE LUC), A., i, 965.
- Quinol**, hydroxy-, derivatives of (BARGELLINI and AVUTINI), A., i, 63; (BARGELLINI), A., i, 305; (BARGELLINI and MARIEGGIANI), A., i, 354, 965; (BARGELLINI and ABBATI), A., i, 855.
- Quinol**, compound of, with p-benzoquinone (SIGMUND), A., i, 654.
- Quinol**, compound of, with 1-monomethyl ether, and their metallic salts (SNOW), T., 1609; P., 98.
- Quinol**, estimation of (PINNOW), A., ii, 779.
- Quinolecarboxylic acid**, hydroxy-, barium salt, and bromohydroxy-, and dihydroxy-, (V. HEMMELMAYER), A., i, 394.
- Quinoline**, constitution of the ϕ -bases of (KAUFMANN and PLÄY JANINI), A., ii, 915.
- Quinoline**, salts of (HILDEICH), T., 236.
- Quinoline**, salts, chromoisomerism of (HANSCH), A., i, 673.
- Quinoline**, compound of copper benzoate and (BRADY), P., 94.
- Quinoline**, salts and compound of, with carbon tetrabromide (DEHN and DEWAY), A., i, 945.
- Quinoline**, methonitrate (NOLLI), T., 1601; P., 298.
- Quinoline**, gaseous, salts and derivatives of (DECKER, KAUFMANN, FREIER, PRONAIKZA, and ALBERTINI), A., i, 1925.
- Quinoline**, methiodide (KAUFMANN, WIGDER, and ALBERTINI), A., i, 749.
- Quinoline**, hydroxy-, absorption spectrum of (DORRIS and FOX), P., 325.
- Quinoline alkaloids** (HOFF and ROBINSON), T., 2114; P., 265.
- Quinoline**, synthesis in the group of (HOFF and ROBINSON), T., 1153; P., 125.
- Quinolins** colouring matters (KAUFMANN, STRUBIN, ANASTACHEWICH, FRIEDL, and SZNAJDER), A., i, 328.
- Quinolins** derivatives (PYMAN), T., 1690; P., 215.
- Quinolins**, formation of (PICTET and SPENGLER), A., i, 750.
- Quinolins**, physiological action of (LAIDLAW), A., ii, 220.
- Quinolinscarbinol**, hydroxy-, new" (COHN), A., i, 567.
- Quinolins-5-carboxylic acid**, preparation of (V. JAKUBOWSKI), A., i, 81.
- Quinolinsic acid**, betaine of, and its hydrochloride (KIEPAL), A., i, 157.
- Quinolinsium** osmichloride (GUTHRIE and WATKINS), A., i, 191.
- Quinolinsium**, platinum bromide (GUTHRIE, BAIRDRELL, and OBERMAIER), A., i, 33.
- Quinolinsylacetyleveratrole** hydrobromide (MUNICH and HUBNER), A., i, 566.
- Quinolinsylphenyleneketonecarboxylic acid** (NOLLI and HERZATM), A., i, 917.
- Quinolinsylphenylenemethanocarboxylic acid** (NOLLI and HERZATM), A., i, 917.
- Quinone**. See p-Benzoquinone.
- Quinones** (HACKER), A., i, 135.
- Quinones**, condensation products from (LESER), A., i, 994.
- Quinones**, chloro-amino- (HAEFELI), A., i, 993.
- Quinones**, action of diphenylketone on (STAUDINGER and BEERZ), A., i, 459.
- Quinones**, estimation of, volumetrically (KNECHT and HIEBEL), A., ii, 76.
- Quinones**, synthesis of (LIEBERMANN), A., i, 656.
- Quinones**, anilidiphenylhydrazones, and p-hydroxy-, hydrochlorides (WILLAND and WICKERT), A., i, 82.
- Quinonediimine**, compound of, with pentrophenol (KNOBE), A., i, 654.
- Quinonediimonomium** nitrate (PICCARD), A., i, 569.
- Quinone-imides** (MIGRUPA and KUNZENS), T., 1283, 2034; P., 157, 263.
- Quinonoid compounds** (WILLATÄTTER and CHAMER), A., i, 90, 736.
- Quinonoid compounds** (MADLER), A., i, 323; (WILLATÄTTER and MILLER), A., i, 728, 729.
- Quinonoid colouring matters** (PICCARD), A., i, 568.
- Quinonoid** and *meri* Quinonoid salts of benzidine (PICCARD), A., i, 493.
- Quinotoxine**, oximinine, decomposition of (KABE and MILARCH), A., i, 741.

B.

- Babbies**, nephritis in (HARVEY), A., ii, 1013.
- Racemic compounds**, recognition of (VAN DER LINDEN-KREYER), A., ii, 477.

Racemic compounds, application of the phase rule to the recognition of (LADENBURG), A., ii, 265, 707.
preparation of optically active polypeptides from (ABDERHALDEN and GEDDERT), A., i, 842.

Racemic acid as an analytical reagent (KLING), A., ii, 539.

Radishes, red, the colouring matter of (SACHER), A., ii, 148.

Radioactivity. See under Photochemistry.

Radio-elements, arrangement of, in the "cubic" periodic system (VAN DEN BROEK), A., ii, 709.

Radium content of rocks (BUCHNER), A., ii, 243.

and uranium, ratio between, in minerals (PIRRET and SODDY), A., ii, 454; (GLEDITSCH), A., ii, 845.

content from borings at Beachville, Ontario (EVZ and McINTOSH), A., ii, 540.

content of potassium salts (SATTERLY), A., ii, 243.

metallic, attempts to prepare (HERSCHFINKEL), A., ii, 844.

units of measurement of (JABOIN), A., ii, 8.

production of helium by (BOLTWOOD and RUTHERFORD), A., ii, 953.

transport of the active deposit of (WELLISCH), A., ii, 358.

influence of the rays of, on the photoelectric sensitiveness of metals (DEMNER), A., ii, 567.

new perpetuum mobile for (GREENACHER), A., ii, 684.

problems concerning (VERESADSKY), A., ii, 359.

and its compounds, probable chemical properties of (DE FORCEAND), A., ii, 172.

influence of acids and salts on the amount of emanation liberated from a solution of (EVZ and McINTOSH), A., ii, 841.

β rays of (DANYSZ), A., ii, 840.

chemical effects of the rays of (LIND), A., ii, 841.

direct action of, on ammonia (PERMAN), T., 132; P., 7.

introduction of, into the tissues (HABER, DANNE, and JABOIN), A., ii, 418.

changes in normal tissues produced by (GRÜNBAUM and GRÜNBAUM), A., ii, 132.

Radium emanation (*niton*), relation between atomic weight and viscosity (RABENHORN), A., ii, 27.

Radium emanation (*niton*), relation between atomic weight and viscosity (RABENHORN), A., ii, 27.

disintegration of (GRAY and RAMSAY), A., ii, 27.

volatilisation of, at low pressure (BOYLE), A., ii, 6, 7.

solubility of, in water (RAMSDEY), A., ii, 27.

action of, on thorium (SCHFINKEL; RAMSDEY), A., ii, 27.

bactericidal action of (PRYTZ), A., ii, 321.

action of, on blood (RUSSE), A., ii, 802.

estimation of (TILLOT), A., ii, 27.

amount of, in a sample of (BERES-SUR-ORLEANS), A., ii, 144.

amount of, in soil (CRÉMIER), A., ii, 144.

atmosphere (JOLY and RUSSE), A., ii, 1048.

estimation of, in rocks (JOLY), A., ii, 645.

estimation of, in minerals (MARCKWALD and RUSSE), A., ii, 360.

residues, separation of a (WELLS), A., ii, 7.

Radium ϵ , complex nature of (MAKOWER), A., ii, 844.
new radiation from (WELLS), A., ii, 651.

ionisation produced by the β rays of (EVZ), A., ii, 954.

Radium-D, β -rays from (HAHN and MEISNER), A., ii, 371.

Raffinose, hydrolysis of (HARRIS), A., ii, 371.

Rain-water. See under Water.

Rats, tame, volume and growth of blood in (CHISOLM), A., ii, 117.

Rays. See under Photochemistry.

Reagent bottles, method of cleaning (WALTON), A., ii, 276.

Rectification tubes, new (EWING), A., ii, 256.

Reduction and oxidation by (ZELINSKY and GLINKO), A., ii, 841.

Reflex action under chloroform (RINGTON and SOWTON), A., ii, 371.

Refractivity. See under Photochemistry.

Rennet, preparations of solution from pepsin (HAMMAL-SUR-ORLEANS), A., ii, 998.

specific inhibition of digestion by (HEDIN), A., ii, 998.

curdling of milk by (BANKS), A., ii, 826.

Rennin (*chymosin*), identity with pepsin (VAN HASSELT), A., ii, 998.

(PORTER), A., i, 298.
in the gastric juice of (RABENHORN), A., ii, 827.

- Renals** (Ammoria), and its zymogen, *in* the calf's stomach (HEBIN, A., ii, 403).
- Resin** from an Egyptian sarcophagus, constituents of (REUTER, A., i, 877).
- Resin acetic* (KOHLEB, A., i, 125).
- Resin acids** (KOHLEB, A., i, 295).
- Resin spirit**, detection of, in turpentine (GIMACH, A., ii, 231).
- Resodicarboxylic acid**, position of the substituents in (WATZ, A., i, 541).
- Resoreinol**, formation of iodine derivatives of (GERARD, A., i, 289).
- Resoreinol*, of, with phenazine (ZEEWITSOFF, and A. OSTROMISLANSKY, A., i, 849).
- Resoreinol*, and its nitro-derivatives (KOFFMANN and KUGEL, A., i, 268).
- Resoreinol* and hydrochloride (MCCAS and McINTOSH, A., i, 289).
- Resoreinol*, carbonate of (EINHORN and REINHART, A., i, 794).
- Resoreinol*, amine, hydrochloride (KOFFMANN and KUGEL, A., 1950).
- Resoreinol**, 2:4:6 tribromo-, yellow mercurous salts, and dimethyl ether of (FOLLEY and HINTER, A., i, 283, 284).
- Resoreinol*, benzoylamino- (KYM and KOWERSKI, A., i, 1945).
- Resoreinolanthrone**, *derivative* (SCHARIN, KUNZOFF, NACOFF, GANDERIN, BENKOFF, and DMITRIEFF, A., i, 676).
- Resorcinyl dip-nitrobenzoate**, 1:6-*derivative* (KYM and KOWERSKI, A., i, 1944).
- Respiration** apparatus for estimation of expired carbon dioxide (BENEDICT and ROMANS, A., ii, 498).
- Respiration*, of dyspnea (HUGH, A., ii, 293).
- Respiration*, of mice with carcinoma (CHINSON, A., ii, 211).
- Respiration*, of plants. See: Plant respiration.
- Respiration*, by the blood (WINTERSTEIN, A., ii, 211).
- Respiration*, action of drugs on (V. ISSERLITZ, A., ii, 1917).
- Respiration*, of injected saline solutions on (VIRBAY, A., ii, 739).
- Respiration*, of air rich in oxygen (BENEDICT and HUGHES, A., ii, 498).
- Respiration*, rates of absorption of oxygen in (DOUGLAS and HALLDANE, A., ii, 767).
- Respiration*, influence of, on the blood (WARRER, A., ii, 211, 503).
- Respiration*, as affected by body position (EMMES and RICHET, A., ii, 910).
- Respiration**, influence of diet on (BENKOFF, EMMES, and RICHET, A., ii, 211).
- Respiration*, influence of exertion of sleep on (AMER, A., ii, 48).
- Respiration*, effect of electric bath on (JESK, A., ii, 215).
- Respiratory centre**, excitability of the (LINDHARD, A., ii, 617).
- Retenocarboxylic acid** (LIEBERMANN and ZIEFF, A., i, 388).
- Rhamnoflorin** (TSCHIRCH and BROMBERGER, A., ii, 528).
- Rhamnose-carboxyanilide** (IRVING and HYSK, T., 165, P., 9).
- Rhamnose** (TSCHIRCH and BROMBERGER, A., ii, 528).
- Rhamnose*, influence of, constituents of the bark of (TSCHIRCH and BROMBERGER, A., ii, 528).
- Rhein**, also emodin and chrysophanic acid, relation between (BUTSCHER, A., i, 887).
- Rhein*, and its derivatives (FELT and CLEWER, P., 351; P., 89).
- Rhein**, *glucoside* (LAGER, A., i, 140).
- Rheinolic acid** and its acetyl derivative (FELT and CLEWER, T., 951, P., 89).
- Rhodanic acids**, substituted, and their condensation products (BUTSCHER, A., i, 333).
- Rhodonic acid*, and its barium salt and lactone (VODICK and KRAUZE, A., i, 179).
- Rhodose**, stereochemical configuration of (HUSON, A., i, 355).
- Rhodose* (VODICK), A., i, 354.
- Rhodose*, and its methylphenylhydrazine (VODICK and KRAUZE, A., i, 179).
- Rhodium**, electrical properties of (BROSLAWSKI and HACKFIELD, A., ii, 1935).
- Rhodium*, and hydroxy-bromides and tri-iodide (GOLDSTEIN, A., ii, 35).
- Rhodizite** from pegmatites of Madagascar (HUTER, WUNDER, and SAGOT, A., ii, 1195).
- Rhubarb**, constituents of (TUTIN and CLEWER, T., 946; P., 89).
- Rhubarb*, occurrence of alizarin in (MULLER, T., 967; P., 101).
- Ribose*, hexoses from (LEVENE and JACOB, A., i, 14).
- Rice**, value of, as a food (ARON and HOSON, A., ii, 625).
- Rice*, hemolytic action of the fat of (SHIMAZONO, A., i, 765).
- Ricinoleic acid**, aromatic acyl esters of (VEERINDEK CHININPABIREN ZIMMER & Co., A., i, 197).
- Riebeckite**, a variety of, from Mysore (CHANDLER, A., ii, 777).

- Riebeckite** from Quincy pegmatite (PALACHE and WARREN), A., ii, 615.
- Ring, six-carbon**, attempts to form a (SACHS and BRUGL), A., i, 719.
- Rinnelite**, composition and occurrence of (RINNE and KOLB), A., ii, 613.
- Rocks**, radioactivity of (GÖCKEL), A., ii, 174.
radium content of (BÉCHNER), A., ii, 243; (JOLY), A., ii, 685.
- Röntgen rays**. See under Photochemistry.
- "Romauxankalk"** in animal metabolism (HAGEMANN), A., ii, 507.
- Roots**, excretion of substances by (MAZÉ), A., ii, 324.
asparagus, constituents of (MORSE), A., ii, 324.
- Rotation**. See under Photochemistry.
- Rotatory dispersion**. See under Photochemistry.
- Rubber**. See Caoutchouc.
- Rubidium**, rays of (HENRIOT), A., ii, 571.
magnesium chromate (BARKER), T., 1327; P., 198.
fluoride, hydrates of (DE FORCHAND), A., ii, 603.
lanthanum acid nitrate (JANTSCH and WIGDOROW), A., ii, 114.
neodymium and praseodymium nitrates (JANTSCH and WIGDOROW), A., ii, 115.
rhodolomide (GELOUTKINE), A., ii, 45.
- Rubies**, artificial, analysis of (CERERO and BAYO), A., ii, 824.
- Rue**. See *Peganum harmala*.
- Rufgallol hexamethyl ether** (FISCHER, GROSS, and NEBER), A., i, 887.
- Ruminants**, digestion in (MARCOFF), A., ii, 810.
- Rumpfte**, analysis* of (GROSSPIETSCH), A., ii, 808.
- Ruthenium**, alkylammonium derivatives of (GURMER and LEUCHS), A., i, 183.
- S
- Sabinene**, reduction of (TSCHUGAEFF and FOMIN), A., i, 72.
- Saccharic acid**, behaviour of, in the organism (SCHOTT), A., ii, 514.
cupric salts of (PICKERING), T., 175; P., 7.
- "Saccharin"** (*o*-benzoisulphinide), detection of (COMANDECCI), A., ii, 80.
See also *o*-Benzoisulphinide.
- Saccharin**, viscosity of solutions of
- Saccharinic acids** (KILIAN), A.
- apo-Safranine**, isomerides of (EISENBERG and RIZRA Y PENTU), A., ii, 89.
(KEHRMANN and MASSON), A., i, 927.
- isoap-Safranine**, salts of (EISENBERG and RIZRA Y PENTU), A., ii, 89.
- Safranines**, synthesis of (EISENBERG), A., ii, 89.
- iso-Safrrole**, dehydration of (PAULIN), A., i, 779.
- Salicylaldehyde** (PFAIFFER, FREIDMANN, PLOS, and SCHWARTZ), A., ii, 791.
bromine sulphite (MAY), A.
- Salicylaldehydedipiperidil** (SCHUBEL and LOREMAN), A., ii, 1030.
- Salicylaldehyde-*p*-methoxyphenylhydrazone** (PADOA and SANI), A., ii, 1030.
- Salicylamide**, combination with chloride with (TITCHELEV), A., ii, 866; P., 102.
- Salicylbenzamidine** (TITCHELEV and HUGHES), A., ii, 1594.
- Salicyldiphenylbenzamidine** (TITCHELEV and HUGHES), T., 1594.
- Salicylthylbenzamidine** (TITCHELEV and HUGHES), T., 1592.
- Salicylhydrobromoquinine** (CHINNEABERES ZIMMER and CHINNEABERES ZIMMER), A., ii, 559.
- Salicylic acid**, action of, on rare metals (MILLER), A., ii, 449.
bismuth salt, assay of (RAQUET), A., ii, 667.
basic bismuth salt of (NABE and BJÖRKSTEN), A., i, 449.
sodium salt, crystallisation of (HARRIS), A., i, 53.
yttrium salt (PRATI and JAMES), A., ii, 893.
ethyl ester, carbonic acid ester (EINHORN and ROTHE), A., 704.
 β -chloroethyl and glycol esters (BOEHRINGER & SOHNER), A., ii, 704.
- Salicylic acid**, *ortho* salt of *carbithionic acid* (BROCK and BIGGE), A., i, 46.
and its salts and esters (BROCK), A., i, 49.
- Salicylic acid**, detection of (WILSON), A., ii, 547; (McCRACKEN), A., ii, 547.
estimation of, in fruit juices (HOUT), A., ii, 775.
- Salicylidene-*p*-aminobenzhydrol** (REY and PORTER), A., i, 339.
- Salicylide-*p*-aminobenzophenone**

- Salicylideneamino-2-methyl-4-quin-
aroline and its derivatives** (Bogert,
Bell, and Amend), A., i, 163
Salicylideneamino- α -phenylacetamide
(Coke and Francis), T., 321.
**Salicylideneamino-2-styryl-4-quin-
aroline** (Bogert, Bell, and Amend),
A., i, 163.
Salicylidene-N-methylbenzidine (Ras-
now and Berger), A., i, 821.
Salicylmethylbenzamidine (Thiherley
and Jotus), T., 1501.
Salicyloxybenzoyl chloride (Bohr-
sche and Sorbka), A., i, 987.
Salicylphenylacetamidine (Thiherley
and Jotus), T., 829; P., 102.
Saliva, alkaline colour of (V. Frey), A.,
ii, 142.
Salts, magnetic changes in the concentra-
tion of a solution of a, in a non homo-
geneous magnetic field (Votie and
Stavrou), A., ii, 578.
Salts, capillary rise of (Skraup, A.,
Bühler, Lang, Philipp, and
Pöhlenger), A., ii, 21.
Salts, distillation of (Lecoq de Boisbaud-
ran), A., ii, 270.
Salts, absorption of positive ions from heated
(Richardson), A., ii, 1051.
Salts, vapour of the vapour of, in a flame
(Moulet), A., ii, 455, 456.
Salts, conductivity and ionisation of (Hunt),
A., ii, 688.
Salts, conductivity of the vapours
of (Schmidt), A., ii, 788.
Salts, tension of solutions of,
in alcohol (Cederberg), A., ii,
159.
Salts, molecular complexity of, in phenol
(Hartung), A., ii, 697.
Salts, behaviour of, in solution (Ferguson), A.,
ii, 719.
Salts, solubility of, in the corresponding
acids (Massoni), T., 1132; P.,
125.
Salts, poorly soluble, solubility of (Petrici-
u-Mme), A., ii, 1073.
Salts, effect of, on the solubility of other
salts (Noyes and Bray; Noyes,
Brown, Farrell, and Stewart),
A., ii, 1074; (Bray and Winnick-
off; Bray), A., ii, 1075.
Salts, heterogeneously magnetic solutions of,
in a heterogeneous magnetic field
(Stafford), A., ii, 850.
Salts, osmotic action of (Loeb), A., ii,
1018.
Salts, osmotic action and toxicity of
(Loeb), A., ii, 221.
Salts, mechanism of the toxic action of acids
by (Loeb and Wasteneys), A., ii,
225.
Salts, diffusion of, through plant organs
(Anstey), A., ii, 760.
Salts, complex, magnetism of (Feynman), A.,
ii, 367.
Salts, double, formation of (Foot), A., ii,
394; (Foot and Hagen), A., ii,
397; (Foot and Walters), A.,
ii, 726.
Salts, formed from alkali sulphates and
sparingly soluble sulphates
(Harris), A., ii, 979.
Salts, double halogen, solutions of, in water
and ether (Mason), P., 328.
Salts, fused, electrolytic valve action in
(Schiff), A., ii, 799.
Salts, hydrated, dissociation of (Bolla), A.,
ii, 375.
Salts, water of crystallisation in (Baker
and Adam), T., 507; P., 17.
Salts, determination of the dissociation
pressure of (Parrington), T.,
166; P., 45.
Salts, inorganic, absorption of light by
(Houshous, Houshous,
Boggs), A., ii, 789; (Houshous
and Anderson), A., ii, 786.
Salts, neutral, adsorption of (Lachs and
Michaelis), A., ii, 100, 1009.
Salts, pent- and hexabasic, conductivity
and ionisation of (Noyes and Low-
bald), A., ii, 864.
Salts, qualitative analysis of complex
mixtures of (Moulet), A., ii,
331.
Salt gardens, mother liquors of (Schlöss-
ing), A., ii, 392.
Salt petre, Chile. See Sodium nitrate.
Salt solutions, properties of, in relation
to the ionic theory (Noyes and
Farr), A., ii, 861.
Salt solutions, gelatinisation and hydration of (V.
Wittmann), A., ii, 860.
"Salvarsan" (*diminosylhydroarseno-
benzoic hydrochloride*), titration of,
with iodine solutions (Garbell), A.,
ii, 679.
Salts, detection of, and its distinction from
other forms of arsenic (Garbell), A.,
ii, 418.
Samarium ammonium molybdate (Bar-
ford), A., ii, 291.
Samarokite from Madagascar (Lacroix),
A., ii, 226.
Salts, from Malina (Tiffert), A., ii, 1105.
Sandalwood oil, constituents of (Schim-
mel and Chou), A., i, 894.
Sandmeyer's reaction (Heller and
Tischner), A., i, 243.
Santalal, copper salt of (Brooks), A., i,
553.
Santene and its derivatives (Konjak-
owa), A., i, 666.

- Santolina chamaecyparissus*, constituents and derivatives of the essential oil of, and the action of hydroxylamine on it (FRANCIGNONI and SCARAFIA), A., i, 1001.
- Saponin**, extraction of, from *Torresia sandaica* leaves (FLIERINGA), A., i, 489.
- influence of, on the toxicity of digitoxin (POSTOFF), A., ii, 1018.
- detection of, by various reactions (REICHARD), A., ii, 235.
- Saponins** (KOBERT), A., i, 893.
- Sapphires**, oriental, colour of (VERSEK), A., ii, 43.
- Sarcosinedithiocarboxylic acid**, benzyl hydrogen ester, and its barium salt (STIEGRIED and WEIDENRUPF), A., i, 117.
- Sawdust**, preparation of oxalic acid from (V. HEDENSTROM), A., i, 767.
- Scandium** in orthite (MEYER), A., ii, 408.
- Scapolite group**, chemical and physical characters of the (HIMMELBAUER), A., ii, 297.
- Scatole** (3-methylindole), behaviour of, in rabbits (BLUMENTHAL and JACOBY), A., ii, 58.
- detection of (SASAKI), A., ii, 80.
- Schardinger's reaction** in cow's milk (REINHARDT and SEIBOLD), A., ii, 418.
- Schaumopal**. See Floatstone.
- Schenck's law** (BERNOULLI), A., ii, 363.
- Schiff's bases**, preparation of (PORAT-KOSCHITZ, AUSCHKAP, and AMSLER), A., i, 688.
- Schizus molle* oil (LALOUE), A., i, 138.
- Schwarzembergite** (SMITH and PRIOR), A., ii, 1100.
- Scolecite** (SMITH), A., ii, 501.
- Scopoletin**, constitution of (MOORE), T., 1043; P., 119.
- Scopolia japonica*, constituents of (WATANABE), A., ii, 427.
- Sealed-tube reactions**, detection of gas in (WALKEN), A., ii, 925.
- Sea-urchin's eggs**. See Eggs.
- Sea-water**. See under Water.
- Secale**, constituents of extract of (ENGLAND and KUTSCHER), A., ii, 528.
- Secale cornutum*, extraction of clavicepsin from (MARINO-ZUCCO and PASQUERO), A., i, 1003.
- Secretin**, presence of, in foetal life (PRINGLE), A., ii, 745.
- Sedimentation tube**, for microscopic analysis (SCHWABE), A., ii, 651.
- Seeds**, induced germination of (MAZE), A., ii, 141.
- effect of heating soil on the germination of (FLETCHER), A., ii, 530.
- Seeds**, carbohydrates in (PRENNINGHA), A., i, 17.
- phosphorus compounds in (BRODT), A., i, 263.
- variation in the amount of phosphorus compounds in (ZWSKI), A., ii, 641.
- ripening, protein for (SCHLIZE), A., ii, 322.
- Selenite**, rate of dissolution on crystalline surface (TAYLOR), A., ii, 24.
- Selenites and Selenious acid** and Selenium.
- Selenium**, preparation of, and reactions of (POCHETTING), A., ii, 119.
- equilibrium of mixtures of (PELABON), A., ii, 119.
- salts, action of, on iodine (JONES), A., ii, 119.
- boride, preparation of (HILL), A., ii, 721.
- Selenites, anhydrous** (ESPER), A., ii, 119.
- Selenious acid**, action of, on manganese dioxide (MARTIN and TANI), A., ii, 608.
- Seltzer water**, action of, on antimony (BARRETT), A., ii, 119.
- Semicarbazide**, action of, on (HOFFMANN, HOCK, and REUTHER), A., i, 359.
- action of, with cyclic amines (RUPE and ALLENBERG), A., ii, 119.
- Semicarbazidecarboxylic acid** α -ethyl ester (BUSCH and F.), A., i, 689.
- Semicarbazones** (HEILBRON and SON), P., 315.
- conversion of azines into (A.), i, 1033.
- Senecio alkaloids**, toxicity of (A.), ii, 912.
- Separating apparatus**, new (A.), ii, 385.
- for heavy liquids (AIRINSON), 105.
- Serological studies** (ABERHOLD and PINCUSOHN), A., ii, 119.
- (HALDEN and RATHSMANN), A., ii, 119.
- (HALDEN and KAMPEL), A., ii, 119.
- (ABERHOLD and SCHUBERT), A., ii, 513.
- Serpentine** from the Ural (WUNDER), A., ii, 405.
- Serum**, calcium content of (TAKAHASHI), A., ii, 392.
- effect of ultra-violet light on (A.), ii, 997.
- behaviour of chloride in (A.), ii, 50.
- fat-splitting power of (ANDERSON and RONA), A., ii, 119.

- Silica**, estimation of chlorine in (RONA), A., ii, 126.
 action of on diastases (WOLFFMUTH), A., ii, 743.
 analysis of esters and fats by (RONA and MICHAELIS), A., ii, 302.
 passage and nucleic content of, in kidney (PEHRIN), A., ii, 632.
 estimation of oxyphosphoric acids in (GRENDEL), A., ii, 302.
Serum albumin, denaturation of (MICHAELIS and RONA), A., ii, 30.
Serum globulin, refractive index of (GRENDEL), A., ii, 341.
Serum reactions, chemical dynamics of (MICHAELIS), A., ii, 618.
 speed of, mechanism of (WEIL and SAUER), A., ii, 618.
Swage, use of, in agriculture (MUNIZ and LAINEZ), A., ii, 764.
 purification of (MUNIZ and LAINEZ), A., ii, 629.
 action of nitrogen during the purification of (MUNIZ and LAINEZ), A., ii, 629.
 estimation of dissolved oxygen and of carbon in (CLARKE), A., ii, 928.
Sweat gas, poisoning by (GORDON), A., ii, 121.
Synthesis, relation of, to metabolism (KEARSE and CLARKE), A., ii, 752.
Silica - See under Silicon.
Silicates - See under Silicon.
Silicates, crystallography of (D. S. HOFFER), A., ii, 186.
Silicofluorides, detection of (BROWNING), A., ii, 1039.
Silicic acid, tertiary, preparation of (KIEFFER and HARKNER), T., 135; P., 8.
Silicic methane, isomeric and oligomeric (BESSON and FORENIER), A., ii, 18.
Silicon amorphous (CAMBI), A., ii, 600.
 ethyl and ethyl bromides (BESSON and FORENIER), A., ii, 38.
 chlorobromides and chlorobromides of (BESSON and FORENIER), A., ii, 29.
Silicon alloys with carbon and iron (GOTTFELMANN), A., ii, 1091.
 with metals (FRIEDLEY), A., ii, 879.
Silicon dioxide carbon and aluminum silphane, hydrolytic and montmorillonite (THOMAS), A., ii, 219; (STILMEIER), A., ii, 196.
 equilibrium of, calcium and aluminum oxides (SHEPHERD, RANKIN, and WRIGHT), A., ii, 725.
 purities of magnesian oxide with (DORNINGER), A., ii, 608.
Silicic acid (CAMBI), A., ii, 691.
Silicic acid, structure of the gel of (ZIMONDSKY), A., ii, 889.
Silicon -
Silicic acid, colloidal, preparation of (KEFER and FRITZNER), A., ii, 723.
 history of (WALDEN), A., ii, 1086.
 vegetation of (PAIDAPAY), A., ii, 1077.
Silicates, formation of, in binary systems (VAN KROOSTER), A., ii, 111.
 constitution of complex (SINGER), A., ii, 979.
 thermochemistry of the (DITTLER), A., ii, 96.
 mean specific heat of fused and crystallized (SCHULZ), A., ii, 1059.
 hydrothermal (BAUR and BROCKE), A., ii, 391.
 fusion of (LIEFFERT), A., ii, 604.
 decomposition of, by pure water (VAN DER LEIDEN), A., ii, 239.
 molten, absolute viscosity of (DITTLER and STICK), A., ii, 880.
 detection of (BROWNING), A., ii, 1030.
 analysis of (RIEF and LEHMANN), A., ii, 658.
 microchemical analysis of (CANAVAT), A., ii, 1029.
 estimation of ferrous iron in (DITTLER), A., ii, 343.
 estimation of fluorine in (KLEIN-STICK), A., ii, 1020.
Silicon organic compounds (KIEFFER and HARKNER), T., 135; P., 8.
Silicon, estimation of, in iron containing graphite (REICHARD), A., ii, 929.
 estimation of, in vanadium and molybdenum and in their iron alloys (FRAMMANN), A., ii, 538.
Silicetungstic acid, atropine, cocaine and sparteine salts of (JAVILLIER), A., ii, 152.
Silk, composition of (STRACHY), A., ii, 511.
 composition of different kinds of (CARDEWALDEN), A., ii, 1050.
 Indian, Tusser, amino acids from (STRACHY), A., ii, 511.
Silver, atomic weight of (BAUTER), A., ii, 112.
 spectrum of (KASPER), A., ii, 831.
 arc spectrum of (DUFFIELD), A., ii, 359.
 electrolytic deposition of (HUGHES and WHITELOW), A., ii, 154.
 an allotropic form of (PALITZCH), A., ii, 724.
 colloidal forms of (LEPP-GRAMER), A., ii, 394.
 hydroxide, absorption of light by (PHILLIPS), A., ii, 1043.

- Silver**, extraction of, from its ores (KCHN), A., ii, 884.
 the system tin, lead and (PARRAVANO), A., ii, 281.
 zinc and lead, equilibrium in the system (KREMMANN and HOFMEIER), A., ii, 884.
 and lead halogen salts, ternary systems of (MATTHES), A., ii, 476.
 compounds of, with cadmium (PETRENKO and FEDOROFF), A., ii, 890.
 staining, histological, colloidal chemistry of (LIESEGANG), A., ii, 971.
 combination of the halogens with finely divided (KANTLE), A., ii, 481.
Silver alloys with cadmium (PETRENKO and FEDOROFF), A., ii, 281.
 with calcium (BAAR), A., ii, 611.
 with copper and gold (JANECKE), A., ii, 1089.
 with magnesium, electrical conductivity and hardness of (SMIRNOFF and KURNAKOFF), A., ii, 888.
 with mercury, relation of the conductivity of, to temperature (CALVO), A., ii, 574.
 with mercury and tin (JOYNER), T., 195; P., 5.
 with zinc and lead, potential of (KREMMANN and HOFMEIER), A., ii, 848.
Silver conometer, use of silver fluoride in the (EISENREICH and FOERSTER), A., ii, 461.
Silver chloride, mixed crystals of, with sodium chloride (BOTTA), A., ii, 293.
 constitution of the compound of, with ammonia (STRAUB), A., ii, 883.
 fluorides (VANINO and SACHS), A., ii, 884.
 iodide, absorption of ultra-violet light by (SCHELL), A., ii, 831.
 equilibrium diagram of (TAMMANN), A., ii, 195.
 mercuric iodide, uniformity of (WEGELIUS), A., ii, 884.
 photohalides (REINDERS), A., ii, 39, 490; (LIESEGANG), A., ii, 39; (TRIVELLI), A., ii, 281; (SICHLING), A., ii, 680; (BAUR), A., ii, 681.
 nitrate, action of, with potassium ferrieyanide and ammonia or amines (GASTALDI), A., i, 185.
 reaction of, with iodoacetonitrile (LOY and ACREE), A., i, 360.
 interaction of, with potassium persulphate and its catalytic effect in oxidation of organic substances (AUSTIN), T., 262; P., 24.
Silver nitrite, decomposition of (OSWALD), A., ii, 281.
 and gold telluride, new compound (A.), ii, 901.
Silver, assay of, by the (STEINMANN), A., ii, 1137.
 estimation of (DUTOITABLE), A., ii, 1137.
 estimation of, by (GOUGH and FEISLER), A., ii, 1137.
 estimation of, in copper (BENNER and ROSS), A., ii, 338.
Sinigrin, saponification of (MANN), A., i, 139.
Skin, influence of feeding on (BORSCHID), A., ii, 902.
Smithsonite, synthesis of (A.), ii, 902.
Snake, North American, toxin from the (A.), ii, 317.
Snowdrop. See *Galanthus*.
Soap, constitution of, in (DEN), T., 191; P., 5.
 solutions, constitution of (and TAYLOR), A., i, 340.
 density of (CORNISH), A., ii, 771.
Soaps, production of (DOFFER), A., ii, 791.
 estimation of glycerol in (HEMPEL, SIMMICH, SCHAEFER and WIESEMANN), A., ii, 771.
Sodamide, action of hydrogen on (STOLLE), A., ii, 241.
 action of ketones with (BAUER), A., i, 726.
Sodium, metallic, action of, on hydrate (SCANDOLATO), A., ii, 241.
 action of, on mercury (KARL and KLEIN), A., ii, 726.
 and potassium, action of, on (BANERJEE), A., ii, 199.
 and potassium compounds, isomorphism of (SOMMERFELD), A., ii, 420.
 and potassium salts, action of, the toxicity of (LOEB and WATKINS), A., ii, 420.
 vapour, influence of neutral gas on the absorption of (FRIEDRICH), A., ii, 1043.
Sodium alloys with gold (MATHIAS), A., ii, 732.
Sodium bismuthide (VORONOV and BEAU), A., ii, 405.
 diborate, technical preparation of (LEVI and GARAVINO), A., ii, 981.
 rhodobromide (GOLOUBKINE), A., ii, 45.
Sodium carbonate, solubility of (XER), A., ii, 603.

- sodium carbonate and hydrogen carbonate, reciprocal solubility of, in water (DE PARPEL, A., ii, 459; HERGEN, A., ii, 724).
- hydrogen carbonate and water, equilibrium in the system (McCoy and TESTI, A., ii, 379).
- and sulphate, calcium carbonate and sulphate, equilibrium between (HERZ, A., ii, 794).
- effluence of crystals of (CEM-SING, A., ii, 111).
- action of, on calcium carbonate (OCHSNER DE COSINCK, A., ii, 396).
- action of, on sugar solutions (JOLLES, A., i, 421).
- hydrogen carbonate, dissociation pressure of (CAVEN and SAND, T., 1309; P., 147).
- potassium carbonates (OSAKA, A., ii, 723).
- carbonate, circular double refraction (MESTIN, A., ii, 679).
- chloride, crystal-habit of (RITZEL, A., ii, 488).
- electrolysis of (PETERS, A., ii, 1136).
- conductivity of, and of its mixtures with hydrochloric acid (BRAY and HUNT, A., ii, 688).
- depression of the freezing point of, and calcium chloride (LAMP-LOGG), A., ii, 581).
- mixed crystals of, with silver chloride (BOITA, A., ii, 293).
- and sulphate, copper chloride and sulphate, and water, the system (SCHREINEMAKERS and DE HAAT, A., ii, 38; (SCHREINEMAKERS, A., ii, 592).
- mercury, and nickel or platinum, reactions in the system (PETERS, A., ii, 1095).
- decomposition of (VOIRNASOS, A., ii, 392).
- action of solutions of, on iron (FRIEND and BROWN, T., 1302; P., 156).
- and potassium chloride in food (BIERNACKI, A., ii, 633).
- influence of, on the toxic action of potassium chloride (JOHN and WASILEWYS, A., ii, 517, 756).
- action of injections of (WILENKO, A., ii, 1015).
- chromate, use of the transition temperatures of, in thermometry (RICHARDS and KELLEY, A., ii, 695).
- hydroxide, action of, on triethyl phosphate (OCHSNER DE COSINCK, A., ii, 396).
- Sodium hydroxide, action of, on sugar solutions (JOLLES, A., i, 421).
- and potassium nitrates, heat of solution of fused mixtures of (v. ZAWITZKI and SCHLAGGER, A., ii, 257).
- nitrate, estimation of, by the "nitrous" method (RAPLEFRGER, A., ii, 69).
- nitride, corrosion of metals in (TUGENSTINE, A., ii, 693).
- peroxide, heat of combination of acidic oxides with (MIXIER, A., ii, 966).
- action of, on bismuth salts (HANTÉ and KATZNER, A., ii, 404).
- hydrochloride, formate, benzoate, and ethyl acetate (JABERRI, A., ii, 489).
- phosphate, discharge of positive ions from heated (HODGES, A., ii, 216).
- hydrogen phosphate, standardisation of acids by (FRIEDLIX, A., ii, 1129).
- barium phosphate (QUARFAROLI, A., ii, 489).
- hypophosphite, action of, on copper sulphate in aqueous solution (FIRTH and MYERS, T., 1329; P., 139).
- metasilicate, fusion temperature of (JAGER, A., ii, 981).
- sulphate, mixed crystals of, and potassium sulphate (NACKEN, A., ii, 409).
- sulphite and hydrogen sulphite, action of, on azo-dyes (LEFFELL and LEVI, A., i, 930).
- hyposulphate, conductivity and dissociation of, compared with analogous sulphur-oxygen compounds (JEFFERSON, A., ii, 362).
- thiosulphate as a standard in alkalimetry (EID, A., ii, 769).
- fused, as a cryoscopic solvent (BOITARD, A., ii, 1060).
- parathionate, use of, in fusion of carbonates and nitrates (GOUGH and KUZELIAN, A., ii, 657).
- Sodium organic compounds:—
- cyanamide, oxidation of (LIDOFF, A., i, 418).
- ethoxide, action of hydrogen sulphide on (RULE, T., 558; P., 60).
- manganitrate (JON and GOIRSZ-DEI, A., i, 176).
- Sodium, micro-chemical detection of (LENZ and SCHUOK, A., ii, 439).
- Soils, dihydroxyacetic acid in (SCHREINER and LATHROP, A., ii, 923).
- influence of, on local atmospheric radioactivity (SANDERSON, A., ii, 846).

Soils, effect of heating, on the growth of plants and the germination of seeds (FLETCHER, A., ii, 530).

effect of lime and humus on the properties of (THAYER, A., ii, 648).

influence of, on the root development of wheat and barley (POLLE, A., ii, 224).

acids in (SCHREINER and SHOREY, A., ii, 147).

production of acids and alkalis in (HALL and MILLER, A., ii, 429).

aluminium silicate minerals in (VAN DER LINDEN, A., ii, 299).

bacteriology of (HEINZE, A., ii, 320).

injuries bacteria in (EMMERICH, ZIL LEININGEN, and LOEW, A., ii, 420).

barium in (FALLER, A., ii, 146).

biological-chemical processes in (MOORE, A., ii, 530).

addition of carbohydrates to (HUTCHINSON and MARR, A., ii, 430).

cholesterols in (SCHREINER and SHOREY, A., ii, 327).

manganese in (CONTINO, A., ii, 649).

chemical nature of organic nitrogen in (JONIDI, A., ii, 820).

ammonia and nitrate formation in (LIFMAN, BROWN, and OWEN, A., ii, 642).

relation of the nitrate content of, to non-leguminous plants (LYON and BIZZELL, A., ii, 1025).

organic compounds in (SCHREINER and SHOREY, A., ii, 147).

oxidation in (SCHREINER, SULLIVAN, and REID, A., ii, 146).

pentosans in (SHOREY and LATHROP, A., ii, 146).

phosphoric acid in (SEWERIN, A., ii, 61; (POUGER and CHOIRCHAR, A., ii, 145; (PETIT, A., ii, 649).

transformation of phosphates in (STOKLASA, A., ii, 429).

effect of soluble salts on the adsorption of phosphates by (PATTEN, A., ii, 1128).

products of protein cleavage in (SCHREINER and SHOREY, A., ii, 65).

arable, production of nitrates in (KOCH, A., ii, 922).

estimation of colloids in (KÖNIG, HASENBÄUMER, and HASSLER, A., ii, 1033).

peat, constituents of (ROBINSON, A., ii, 431).

estimation of the methoxyl group in (SHOREY and LATHROP, A., ii, 327).

estimation of nitrogen in (MITSCHERLICH and MERRES, A., ii, 68).

Soils, estimation of phosphorus in (KASZEE and GREIF, A., ii, 152; (PASSERINI, A., ii, 1927).

estimation of sulphur in (SORNAV, A., ii, 1927).

estimation of weathering products of (HISINK, A., ii, 1927).

Soil humus, biological stimulation of (REMY and ROSING, A., ii, 1927).

Solanaceae, active constituents of (ANDREWS, T., 1871; P., 1927).

Solanidine from *Solanum* and its salts and derivatives (FERRELLI and MONETA, A., ii, 1927).

Solanine extracted from *solanum* and its salts and acetyl derivative (OBERMAYER, A., ii, 670).

Solanol (ODRO and CESARI, A., ii, 1927).

Solanum dulcamara, (ODRO and CESARI, A., ii, 762).

Solanum sodomaeum, (ODRO and CESARI, A., ii, 670; OBERMAYER, A., ii, 671).

Solid solutions. See **Solutions**.

Solids, energy content of (NOLAN, A., ii, 964).

specific heats of, at low temperatures (HARSCHALL, A., ii, 580).

molecular weight and viscosity (BINGHAM, A., ii, 572).

viscosity and fluidity of colloids, finely-divided, in liquids (BINGHAM and DURHAM, A., ii, 580).

surface areas of finely-divided combustible (LANGRUD and LANGE, A., ii, 1927).

homogeneous, determination of, of, by the "floating" method (ANDERAE, A., ii, 1000).

with monatomic molecules, relation between the elasticity and specific heat of (EINSTEIN, A., ii, 1927).

molecular vibrations of (SHIMADA, A., ii, 84).

Solubility (BRITISH ASSOCIATION REPORTS, A., ii, 794).

influence of (HERZ, A., ii, 1927).

effect of salts on the, of (NOYES and BRAY; NOYES and FARRELL and STEWART, A., ii, 1074; (BRAY and WINSTON, A., ii, 1075).

Solubility coefficients, determined by aspiration (JONES, T., 321; P., 1927).

Solubility product, constant ionic (KENDALL, A., ii, 474).

Solute, volume of a, in solution (TAYLOR, T., 871; P., 96).

Solution, variation of distribution of substances in (DE KROM, A., ii, 705).

- Solution**, volume of a solute in (TYLER), T. 871; P., 96.
- Solutions**, VICHONSKY; HEIZOG, A., ii, 23; (SCHWERS), A. ii, 92.
- Solubility** (GAY-GARVER), A., ii, 122; WASHBURN, A., ii, 862; (JACKSON), A., ii, 1071.
- Thermodynamic theory of** (SUTHERLAND), A., ii, 792.
- Contribution to the thermodynamic theory of** (HARDMAN and PARLING), A., ii, 1769; P., 221.
- Effect of affinity in** (ROZSA), A., ii, 1073.
- Changes in formation of** (WATSON), A., ii, 968.
- Effect of the processes operative in** (WATKINS), T., 349; (GLOVER), T., ii, 579.
- Study of, in acetic and propionic acids** (SACHSOFER), A., ii, 689, 691.
- Effect of temperature and pressure on the electrolytic conductivity of** (KASSAN), A., ii, 462; (KORBER), A., ii, 863.
- Reaction of** (MARC), A., ii, 258; (SHWIM), A., ii, 969.
- Calculation of the specific heat of** (POPOV), A., ii, 851.
- Curves and potentials of, separated by membranes, in presence of non-diffusing electrolytes** (DOSSAN), A., ii, 848.
- Evaporation and vapour tension of** (VETSKY), A., ii, 256.
- Calculated internal pressure in** (POLOWZOFF), A., ii, 101.
- Migration of, through the lymph spaces** (MELTZER), A., ii, 220.
- As anode, electrochemistry of** (ROSENSTWENSKY and LEWIS), T., 238; P., 266.
- Chemical, influence of substitution in the components on the equilibrium of** (KREMAN, DISCHENDORFER, FRANKOVIC, HATSER, HONEL, SCHOLTZ, and VALENCA), A., ii, 871.
- Concentrated, laws of** (WASHBURN and MANNES), A., ii, 1076.
- Modified, vapour pressure and law of solution of** (SPEKANSKI), A., ii, 1963; (WOLFSCHWESKY), A., ii, 1964.
- Aqueous, boiling points of** (BERKELEY and ASHLEY), A., ii, 1932.
- Effect of metals, thermoelectric forces of** (BERNARDI), A., ii, 563.
- In dissolving oxides** (WOLBER), A., ii, 295.
- Transition between colloidal and** (WEIMANN), A., ii, 102.
- Solution pressure and electrolytic dissociation** (KRUGER), A., ii, 789.
- Solvents, nature of** (OSWALD), A., ii, 1068.
- Solvents, influence of the, on the equilibrium constant** (PISARJEWSKY and SHATOVLENKO), A., ii, 11; (PISARJEWSKY and LITVIN), A., ii, 12.
- Somnirol and its acetyl derivative** (POWER and SAWAY), T., 502; P., 53.
- Somnirol and its diacetyl derivative** (POWER and SAWAY), T., 504; P., 53.
- Sopherin, isolation of a sugar from** (TER-MULLEN), A., i, 391.
- Sorbic acid, ethyl ester** (ALWERS and EISENBERG), A., ii, 784.
- Sorbose, photochemical synthesis of** (SCHULTZ), A., i, 354.
- Soxhlet extraction apparatus, improved** (SHIBERAD), A., ii, 877.
- Soy bean, phytoestrogens of** (MATHES and DAHL), A., i, 848.
- Soy bean oil, constituents of** (KIDMAISKI), A., i, 764; (MATHES and DAHL), A., i, 831.
- Spark, new radiant emission from the** (STEFING), A., ii, 836.
- Spark gap** See under Electrochemistry.
- Sparteine, reaction of** (JURISKE), A., ii, 1114.
- Shooting rate** (LAVILLIER), A., i, 152.
- Sparteine, and its derivatives** (MOUTIER and VALERIE), A., i, 319, 362.
- Species, chemical differentiation of** (WHITFIELD), A., ii, 769.
- Specific gravity** See Density.
- Specific heat** See under Thermochemistry.
- Spectra** See under Photochemistry.
- Spermatozoa, histochemistry of** (STEDER), A., ii, 626, 905.
- Spermatozoa, neutralisation of, by extract of the testis and epididymis** (METZSKOFF), A., ii, 217.
- Spirans, nomenclature of** (RADULESCU), A., i, 197.
- Spirita, analysis of, by means of colour reactions of aromatic aldehydes** (V. FEILERSBERG), A., ii, 667.
- Spirocyclic compounds, synthesis of** (RADULESCU), A., i, 458.
- Spirothion, mercury therapeutical of** (LAVISOV and LEVAGI), A., ii, 912.
- Spleen, function of, in fixation of antigens and in production of immune substances** (EL-KHARIT and BRECHT), A., ii, 812.
- Spodiosite** (CAMERON and McCAGHEY), A., ii, 721.
- Stachydrine** (SCHULZE and THIEKE), A., i, 79.

- Stachyose**, hydrolysis of, by enzymes (BIZERY), A., i, 354.
- Stannic salts**. See under Tin.
- Star anise oil**, constituents of (SCHIMMEL & Co.), A., i, 894.
- Starch**, occurrence of, in sugar-beet roots (PEKLO), A., ii, 763.
 action of ultra-violet light on (MARSH), A., i, 356.
 velocity of saccharification of (VAN LAER), A., ii, 28, 478.
 chemical hysteresis of (RAKOW-KU), A., ii, 470.
 acid hydrolysis of (DURVEY), A., i, 711.
 action of acids and hydracids on (OECHSNER DE CONINCK and RAYNAUD), A., i, 423.
 action of hydracids on (OECHSNER DE CONINCK), A., i, 181; (OECHSNER DE CONINCK and RAYNAUD), A., i, 607.
 action of oxalic, lactic, malonic, and tartaric acids on (OECHSNER DE CONINCK and RAYNAUD), A., i, 770, 771.
 adsorption of substances by (LOYD), A., ii, 700.
 formation of dextrins from, by bacilli (SCHARINGER), A., i, 181.
 nature of so-called gallsin in syrup of (GATTERBAUER), A., i, 837.
 preparation of viscose from (OST, WESTHOFF, and GESSNER), A., i, 710.
 metabolism. See Metabolism.
 excretion of, by the kidneys (VOIGT), A., ii, 1116.
 paste, catalytic transformations of (FERNBACH and WOLFF), A., i, 356.
 detection of, in dressed food (CARLES), A., ii, 340.
 estimation of (SCHUBERT), A., ii, 75; (GREIFENHAGEN, KÖNIG, and SCHOLL), A., ii, 1037.
- Starvation**, changes in blood-serum during (POLANYI), A., ii, 741.
- Statice gmelini** (Kernck), constituents of the root of (POVARNIN and SEKRTEFF), A., ii, 64.
- Stearanilide**, *o*- and *p*-chloro- (KING and ORTON), T., 1380.
- Stearic acid**, separation of, from oleic acid (FALCIOLA), A., i, 174.
 ammonium salts and separation of, from oleic acid (FALCIOLA), A., i, 5.
 sodium salt, conductivity of (BOWDEN), T., 191; P., 5.
- Stearic acid**, α -bromo-, amide of, and α -iodo-, calcium salt and amide of (PONZIO), A., ii, 1015.
- Stearic acid**, *tribromostearic*, *tri-iodo*, and *tri-iodostearic* salts of the first series (MANN), A., i, 601, 602.
dihydroxy, in soils (MANN and LATHEOP), A., ii, 92.
iodo-, guaiacol ester of (RIKEN YOKO. F. RYU), A., i, 630.
- Stearoelaidic acid**, preparation of (GAWALOWSKIA), A., i, 602.
- Stearoyl chloride**, *dibromostearoyl*-, *iodo*- (HOFFMANN-LA ROCHE), A., i, 601.
- Steel**. See under Iron.
- Stereoisomerides**, transformation of, into labile modification, by violet light (STOERMER and BRÄUTIGAM, and NEUBAUER), A., ii, 477.
- Stereoisomerism**, application of phase rule to (VAN DER WEGE), A., ii, 477.
 spatial change of position, in (STOERMER), A., i, 424.
 of quinquivalent nitrogen (STOERMER), A., i, 326.
- Stibiotantalite**, analyses of (STIBITZ), A., ii, 1104.
- Stibnite**, influence of light on electrical conductivity of (STIBITZ), A., ii, 1045.
 "Stickstoffkalk," analysis of (STIBITZ), A., ii, 1027.
- Stilbene**, *p*-amino-, and *p*-nitro- derivatives (PFEIFFER and MATTON), A., i, 448.
pp-dichloro-, dichloride (PFEIFFER and MATTON), A., i, 1115.
- 7-nitro-**, action of sodium on, and its isomeric (PFEIFFER and MATTON), A., i, 717.
- oo*'-dinitro-, dichloride** (PFEIFFER and MATTON), A., i, 433.
- Stilbene-2-carboxylic acid**, *2*'-nitro-, *2*'-nitro-4'-nitro-, and *4*'-nitro-2'-cyano-, and *pp*-dichloro- (PFEIFFER and MATTON), A., i, 448.
- Stilbene-4-carboxylic acid**, *2*'-nitro-, ethyl and methyl esters (PFEIFFER and MATTON), A., i, 449.
- Stilbene-2'-2'-dicarboxylic acid**, *2*'-nitro-, (PFEIFFER and MATTON), A., i, 448.
- Stilbene-2'-4'-dicarboxylic acid**, *2*'-nitro-, and its methyl ester (PFEIFFER and MATTON), A., i, 448.
- α - and β -Stilbenediol diacetates**, separation of (FRANCIS and KEASE, T. C.), A., ii, 44.
- Stokes's law**, validity of (FRANCIS and KEASE, T. C.), A., ii, 104.
 correction to (MILLIKAN), A., ii, 175.

- Stomach**, presence of bile in the (CATHART), A., ii, 749.
 behaviour of lead compounds in the (THOMASON), A., ii, 60.
 regeneration of proteins in the (GLANZBERG), A., ii, 625.
 saliva, rennin and its xymogen from the (HEDIN), A., ii, 621.
Stomata, excretion of substance by (MATT), A., ii, 324.
Storaine and its homologues, physical and physiological properties of (VELLY and SYMES), A., ii, 516.
Strontium and calcium, separation of the spectral lines of, in the magnetic field (MOORE), A., ii, 559.
 salts, action of, on algae (LOEW), A., ii, 322.
Strontium, detection of, barium, calcium and lead (BROWNING and BLUMENFELT), A., ii, 1032.
 separation of, from calcium (MOSE and MACHUKIN), A., ii, 432.
 (HINDS), A., ii, 440.
 separation of, barium, calcium and (HORN VAN DER BOSS), A., ii, 228.
 (HENSEN), A., ii, 770.
Strophantus and digitoxin, comparative action of, on the heart (ROBINSON), A., ii, 515.
Stroverite from South Dakota (Hess and WEISS), A., ii, 429.
Strychnine, inhibition of the toxic properties of, by peripheral nerves (WADAT), A., ii, 315.
 persistence of, in a corpse (GRAM and MEYER), A., ii, 315.
 influence of, on bacteria (SAPIROFF), A., ii, 1918.
 hydrochloride, double salt of, with antimony pentachloride (THOMSEN), A., i, 484.
 hydrate (KEATZ), A., i, 1916.
 formaldehyde sulphite and anhydrosulphite (MAYER), A., i, 221.
Strychnine, monobromo-, tetrachloro-, and octachloro-, and their derivatives (CHISA and SCAGLIARINI), A., i, 1916.
Strychnine, detection of (DENIGES), A., ii, 673.
 detection of, colorimetric (MAMELL), A., ii, 552.
 detection of, colorimetrically (SANTANA), A., ii, 553.
Stychnos alkaloids (LEUCHS and ANDERSON), A., i, 749, 1018.
 (LEUCHS and GRIFFEL), A., i, 1018.
 (TILMANN), A., ii, 141.
Styrene and its derivatives, heats of combustion of (LEMOULT), A., ii, 583.
 C. II.
Styrene, action of magnesium organic compounds on (OPIEL), A., i, 433.
Styrene, *p*-chloro- α -nitro-, α -nitro- α -hydroxy-, and its 3 carboxylic acid, α -nitro- α - and β -hydroxy-, and α -3,4-dinitro-2-hydroxy (REMPER, T., 286; P., 21).
Styrenes, heats of combustion of (ATWEINS, ROTH, and EISENTHORN), A., ii, 1065.
Styryl 88 dimethylfulgenic acid (STORRE, BENARY, and SEYDEL), A., i, 381.
Styryl 88 dimethylfulgide (STORRE, BENARY, and SEYDEL), A., i, 380.
Styryl 8' furyldivinyl ketone (BAKER and DIKERT), A., i, 922.
Styryl methyl diketone benzylidenediacetyl and its hydrazone derivatives (HILLS and ANDERSON), A., i, 164.
2-Styryl 3 methyl 4 quinoxalene, and amino (BOCKEL, REIT, and AMEND), A., i, 162, 163.
Styryl- α , and *p*-oxyacetic acid, α -nitro-, ethylester (REMPER, T., 286; P., 21).
2-Styryl 4 quinoxalene and 3 amino-, 7- α -styrylamino-, 3,7-diacetylamino-, and α -hydroxy-, and their derivatives (BOCKEL, REIT, and AMEND), A., i, 162.
Styryl 8 styrylvinyl ketonephenylhydrazones BATH and DIETHELM), A., i, 902.
Sublimation, apparatus for (DIEPOLDER), A., ii, 96.
 (WRIGHT), A., ii, 384.
 in a vacuum, apparatus for (CHRISTOPHER), P., 236.
Substance, C_6H_5Cl , from acety-88 hexachloro-2,3-butylene and quinoline (NORRMEIST), A., i, 316.
 $C_6H_5Cl_2$, from the action of light on acetone and ethyl alcohol (CIAMICIAN and SILBER), A., i, 514.
 $C_6H_5Cl_2N_2$, from ethyl bromosuccinate and hydrazine hydrate, and its derivatives (CITRUS and GUCKEL), A., i, 492.
 $C_6H_5Cl_2N_2$, from oxidation of 3 and 7-methylcyclic acids (GROHMANN), A., i, 691.
 $C_6H_5Cl_2N_2$, from oxidation of 3- and 7-methylcyclic acids (GROHMANN), A., i, 691.
 C_6H_5S , from α -chloroiodohexane and potassium sulphide (V. BIAEN), A., i, 75.
 C_6H_5NCl , from α -dimethylpyrrole and sulphuryl chloride, and its derivatives (GELACCHIO), A., i, 225.
 $C_6H_5S_2$, from α -thienyl methyl ketone, carbon disulphide and potassium hydroxide and its derivatives (KEILNER and SCHWARTZ), A., i, 740.

- Substance.** $C_6H_5O_2N_2$ from condensation of nitromethane and 5-nitrosalicylaldehyde (REMPER), T., 287.
- $C_7H_{10}O_2N_2$ from hydrazine hydrate and ethyl dimethylpyronecarboxylate (PALAZZO and LIVERANI), A., i, 921.
- $C_8H_{12}O_2$ from condensation of crotonaldehyde (SMEDLEY), T., 1631.
- $C_8H_{10}O_2$ from condensation of crotonaldehyde (SMEDLEY), T., 1632.
- $C_8H_{10}O_2$ from oxidation of camphene (HENDERSON and SUTHERLAND), T., 1548; P., 212.
- $C_8H_{10}OS_2$ from acetophenone, carbon disulphide, and potassium hydroxide, and its ethers (KELBER and SCHWALZ), A., i, 741.
- $C_8H_8O_2N_2$ from cinnamoylhydrazide hydrochloride and sodium nitrite (MUCKERMANN), A., i, 682.
- $C_8H_{10}O_2N_2$ from extract of mushroom, and its aurichloride (KUTSCHER), A., ii, 528.
- $C_8H_{10}O_4P$ from α -hydroxy- $\beta\beta$ -dimethylbutyric acid and phosphorus pentachloride (RICHARD), A., i, 8.
- $C_{10}H_{16}O_4$ from 3:4-dihydroxycinnamic acid and methyl alcohol (POSNER), A., i, 53.
- $C_{10}H_{16}OS_2$ from *p*-tolyl methyl ketone, carbon disulphide and potassium hydroxide, and its derivatives (KELBER and SCHWALZ), A., i, 740.
- $C_{10}H_{14}O_2N_2$ from condensation of methyl ethyl ketone cyanohydrin and sodioacetoacetic ester (INGLIS), T., 544; P., 46.
- $C_{10}H_{15}O_2N$ from bornylene and nitrous acid (HENDERSON and HEILBRON), T., 1898; P., 249.
- $C_{10}H_{15}O_2N$ from bornylene and nitric acid (HENDERSON and HEILBRON), T., 1900; P., 249.
- $C_{10}H_{18}O_2N_4$ from chloralurethane (DIELS and GUKASSIANZ), A., i, 24.
- $C_{11}H_{18}O_4$ from α -bromomethylfurfuraldehyde and barium carbonate (COOPER and NUTTALL), T., 1200; P., 135.
- $C_{11}H_{18}O_4$ from 3:4-dihydroxycinnamic acid and methyl alcohol (POSNER), A., i, 53.
- $C_{11}H_{18}O_4$ from acetophenone and ethyl chlorocarbonate (HALLER and BAUER), A., i, 300.
- $C_{11}H_{18}O$ from $\alpha\delta$ -di-iodopentane and potassium sulphide (V. BRAUN), A., i, 75.
- Substance.** $C_{11}H_{15}ON$ from methylglutamic acid and aniline (THOLE and THOLE), T., 2231.
- $C_{11}H_{15}O_2N_2$ from chloralurethane (DIELS and GUKASSIANZ), A., i, 24.
- $C_{12}H_{20}O_2N_3$ from ethyl pyruvate and ammonia (DIELS), A., i, 8.
- $C_{12}H_{19}O_2N_2S_2$ from pyruvate and sodiumhydrogensulphide (DERRSCHNABEL and LANGE), A., i, 1006.
- $C_{12}H_{20}O_2N_8$ from 5-ethyl-2-methyl-2-diethylhydantoylcarbamide and acetone (BILTZ and TROST), T., 693.
- $C_{14}H_{19}O_4N_3$ from nitric acid and diisobutyl ether (NITZSCH and KESSELRING), A., i, 34.
- $C_{16}H_{21}O_3$ from angelica root and its derivatives (BOKER and LANGE), A., i, 313.
- $C_{16}H_{23}O$ from the oil of *P. ...* (BÜCKER and HAHN), A., i, 11.
- $C_{16}H_{27}O_6$ from the seeds of *C. ...* (POWER and GALLAGHER), T., 2006; P., 258.
- $C_{16}H_{25}O_4$ from undecyl alcohol and formaldehyde (FORIS), A., i, 27.
- $C_{18}H_{19}ON_2Cl$ from 2-ethyl-2-naphthylpentan-3-one and carbazide (SACHS and BILTZ), T., 721.
- $C_{17}H_{19}O_2$ from benzophenone and ethyl ether (PACER and GALLAGHER), A., i, 65.
- $C_{17}H_{15}O_2N$ from α - and β -naphthyl quinone and *p*-methylphenol (ZINCKE and JORGENSEN), T., 143.
- $C_{17}H_{19}O_2NCl$ from quinone, veratrole and hydrochloric acid (MANNICH and HUENNER), A., i, 14.
- $C_{18}H_{25}O_8Br_{10}$ from the "mercuric" (FRANK and GNAHN), A., i, 647.
- $C_{18}H_{15}ON$ from 2-methyl-2-methiodide and benzaldehyde (VONGERICHTEN and BILTZ), T., 677.
- $C_{18}H_{25}ON_2$ from oxidation of 2-methyl-2-indole (PLASCHKE and GALLAGHER), A., i, 566.
- $C_{18}H_{25}O_2N_2$ from aniline and 3-methyl- α -pyrone (THORPE), T., 2225.
- $C_{18}H_{19}O_2N_4$ from chloralurethane (DIELS and GUKASSIANZ), A., i, 24.
- $C_{18}H_{19}ON_2Cl$ from diphenyl ether, chloride and pyridine, and its derivatives (MEYER and NICOLAUS), A., i, 11.

- Substance.** $C_{13}H_{15}ON$, from oxidation of β -phenyl β -diphenylmethylhydroxylamine (ANGELL, ALESSANDRI, and AIAZZO-MANCINI, A., i, 544).
- $C_{14}H_{15}O_2N_2$, from 3-nitrobenzaldehyde and phenylmethylpyrazolone (Pizzetti, A., i, 62).
- $C_{15}H_{17}O_4$, from bryony root (POWER and MOORE, T., 949; P., 118).
- $C_{15}H_{17}ON$, from oxidation of β -benzyl β -diphenylmethylhydroxylamine (ANGELL, ALESSANDRI, and AIAZZO-MANCINI, A., i, 545).
- $C_{15}H_{19}NCl$, from γ -phenylpropyl amide and dimethylamine (V. BRATS, A., i, 35).
- $C_{15}H_{21}NBr$, from γ -phenylpropyl amide and dimethylamine (V. BRATS, A., i, 35).
- $C_{15}H_{21}O_2NBr$, from 2-(6-nitropiperonyl)-naphthalavanone and bromine (FORKEY and CARRARELLI, A., i, 68).
- $C_{15}H_{17}ON$, from decomposition of phenyltrimethane (HEIMO, A., i, 25).
- $C_{15}H_{17}O_2N_2$, from brucine, nitric acid and potassium hydrogen carbonate, yields quinone (LEITCH and ANDERSON, A., i, 746).
- $C_{15}H_{17}O_2$, from 4:7-dimethylcoumarin and its bromine derivative (FRIES and VOLK, A., i, 205).
- $C_{15}H_{17}O_2N_2$, from diketone $C_{12}H_{11}O_2N_2$ (ANGELL, A., i, 1033).
- $C_{15}H_{17}O_2N_2$, from quinoline and hydroxylamine (KAUFMANN and STREIBER, A., i, 321).
- $C_{15}H_{17}N_2S$, from carvone hydrosulphide and hydrogen cyanide (STEELE, P., 240).
- $C_{15}H_{17}O_2S$, from hydrolysis of the compound of hydrogen cyanide and carvone hydrosulphide (STEELE, P., 241).
- $C_{15}H_{17}N_2$, from the action of light on quinaldine and acetone, and its salts (CIAMICIAN and SILBER, A., i, 647).
- $C_{15}H_{17}O_2$, from benzophenone and isobutyl ether (PATERNO and CHIEFFI, A., i, 66).
- $C_{15}H_{15}O_2N_2$, from condensation of 3-ke to 2-p-dimethylaminoanilcoumarin and 2-coumarinone (FRIES and HASSLWACH, A., i, 151).
- $C_{15}H_{15}N_2$, from interaction of α -nitroso β -naphthol, methylamine hydrochloride and formaldehyde (LANGER, A., i, 505).
- $C_{16}H_{19}O_2N_2$, from reduction of diacetic, and its aurichloride (GORTER, A., i, 562).
- Substance.** $C_{17}H_{15}O_2$, from the action of light on benzophenone and benzaldehyde (CIAMICIAN and SILBER, A., i, 647).
- $C_{17}H_{15}N_2$, from sodium benzeneazo α -naphthyl sulphite (VOROSCHTSCHEFF, A., i, 820).
- $C_{17}H_{15}N_2$, from chlorinated pyridine and β -naphthylamine (REIZENSTEIN and BERNING, A., i, 227).
- $C_{18}H_{17}O_2N_2$, from diketone $C_{12}H_{11}O_2N_2$ (ANGELL, A., i, 1033).
- Succinic acid**, oxidation of, by animal tissues (BALLEW and STERN, A., ii, 132).
- brucine hydrogen salt of (PICCARD and KENYON, P., 60).
- yttrium salt of (BENSER, A., ii, 285).
- menthyl esters of (HILDEBRAND, T., 222; P., 6).
- Succinic acid**, bromo-, ethyl ester, action of hydrazine hydrate on (VIRTHS and GOSKE, A., i, 401).
- α -bromo-, action of aliphatic amines on (FRANKLAND and SMITH, P., 320).
- action of benzylamine on (FRANKLAND, T., 1775; P., 206).
- cinchonine and strychnine salts of (HOLMBERG, A., i, 768).
- α -chloro-, ethyl ester (McKENZIE and BARROW, T., 1919).
- Succinic acids**, stereoisomeric dihalogen (HOLMBERG, A., i, 767).
- dibromo-, configuration of the stereoisomers (McKENZIE, P., 150).
- α -Succino μ -toluidic acid, ethyl ester, crystallography of (ROBERT, A., i, 776).
- Succinylacetoacetic acid**, ethyl ester, and its hydrazine and hydroxylamine derivatives (SCHEIBER and LÖNGWITZ, A., i, 836).
- Succinylidiacetoacetic acid**, ethyl ester (SCHEIBER and LÖNGWITZ, A., i, 836).
- Sucrose** (*saccharose*, *cane sugar*) in the roots of the *Aristolochiaceae* (LESFUR, A., ii, 525).
- action of ultra violet light on (BIERRY, HENRI, and RANCÉ, V. EULER and ORLSEN, A., i, 524).
- solubility of lime in solutions of (CAMERON and PATTEN, A., i, 179; CLAASSEN, A., i, 606).
- effect of, on the accuracy of the copper voltmeter (DEDE, A., i, 461).
- behaviour of, on heating (DUDCHAKY, A., i, 697, 769).
- fate of injected, in the body (HEILNER, A., ii, 635).
- liquid, density of, and of its solutions in water (SCHWERS, T., 1478; P., 298).

- Sucrose** (*saccharose, cane-sugar*), inversion of, by bees (KORNDORFER), A., ii, 1008.
- action of injections of (WILENKO), A., ii, 1015.
- detection of, in wines (SCHAEFFER and PHILIPPE; ROTHENFUSSEN), A., ii, 665.
- estimation of, in the presence of other sugars (JOLLES), A., ii, 74.
- estimation of, in beet-sugar molasses (OGILVIE), A., ii, 232.
- estimation of calcium oxide in the products of refining of (WEISSBERG), A., ii, 659.
- estimation of sugar and of calcium in the residues from refining of (LINDERT), A., ii, 664.
- Sugar**, formation of, in the liver (LOEWITZ), A., ii, 130.
- adsorption of, from solutions (WIEGNER and BURMEISTER), A., ii, 259.
- action of chemical substances on the excretion of (BAER and BLUM), A., ii, 512.
- influence of hydrazine on the amount of, in blood (UNDERHILL), A., ii, 910.
- influence of the liver on the combustion of (VERZAR), A., ii, 746.
- injected, effect of muscular work on the decomposition of (HOHLWEG), A., ii, 127.
- estimation of (BANG), A., ii, 664.
- estimation of, by safranin (HASSELBALCH and LINDHARD), A., ii, 73.
- estimation of, in blood (MICHAELIS and RONA), A., ii, 73; (RONA and DOBLIN), A., ii, 302; (FRANK), A., ii, 340; (LEPINE and BOULUD), A., ii, 619.
- estimation of, in urine (GAEBEL), A., ii, 73; (BANG), A., ii, 664.
- estimation of iodometrically, in urine (FERNAU), A., ii, 664.
- Sugars**, relation between the configuration and rotation of (ANDERSON), A., i, 770.
- effect of, on solutions of salts (GLOVER), T., 379.
- action of ammonia and of sodium carbonate and hydroxides on solutions of (JOLLES), A., i, 421.
- influence of arsenic compounds on the fermentation of, by yeast (HARDEN and YOUNG), A., ii, 519.
- action of muscle plasma and pancreatic extract on (LEVENE and MEYER), A., ii, 414.
- decomposition of, by bacteria (MENDL), A., ii, 318.
- action of *Bacillus lactis aerogenes* on (WALPOLE), A., ii, 318.
- Sugars**, degradation of (JOLLES), A., ii, 15.
- o*-carboxyanilides of the (HARRISON and HEND), T., 161; P., 9.
- estimation of, quantitatively (DACH and SILBERSTEIN), A., ii, 663.
- estimation of, in liquors (HARRISON), A., ii, 346.
- estimation of, in syrups (MANN), A., ii, 446.
- reducing, estimation of (BENNETT), A., ii, 340.
- Sugar**, beet-, influence of nature on the composition of (ANDERSON and URRAN), A., ii, 427.
- non-protein nitrogenous substances (SMOLENSKI), A., ii, 117.
- glycuronic acid derivative from (SMOLENSKI), A., ii, 428.
- Sugar group**, synthesis of bases from (FISCHER and ZACH), A., i, 117.
- Sugar**, invert-. See Invert-sugar.
- "Sugar sand," constituents of (WARREN), A., ii, 821.
- Sugar solutions**, fermented, the influence of, on the respiration of wheat (LINGS (IWANOFF), A., ii, 48).
- Sulphamide**, nitro-, and its derivatives (EPHRAIM and LASOCKI), A., ii, 181.
- Sulphaminobenzoylamino-naphthol**, preparation of, and their sulphonic acids (FARBENFABRIK AG. and BAYER & Co.), A., i, 630.
- Sulphammonium** (RUFF and HENNING), A., ii, 277; (RUFF), A., ii, 181.
- Sulphanilide**, and its derivatives (KASTLE and KOCH), A., i, 36.
- Sulphatide** from the human brain (KASTLE), A., ii, 129.
- Sulphides**. See under Sulphur.
- Sulphinic acid**, chloro-, propyl-, and butyl esters of (STAHLER and SCHMIDT), A., i, 174.
- Sulphinic acids**, aromatic, intramolecular condensation of (HARRISON), T., 1091; P., 139.
- ortho-substituted (CLAASZ), A., ii, 181.
- o*-Sulphobenzonic acid, and its derivatives, their potassium and barium salts (BERTOLO), A., i, 858.
- derivatives of (COBB and FILLARD), A., i, 637.
- p*-Sulphobenzonic acid, α -amino-, fluorescence of, and its derivatives (KASTLE), A., i, 200.
- fluorescence of, and its derivatives (KASTLE and HADEN), A., ii, 181.
- Sulphobenzonic acids**, amino-, and their derivatives (VAN DORSEN), A., i, 29.
- Sulphonylhydrazide**, hydrazine salts (EPHRAIM and LASOCKI), A., ii, 181.

- Sulphonates**, metallic and organic, preparation of (SZEKWEITZ and POIZAT), A., i, 360.
- Sulphonates**, aromatic, action of sulphur on (BOESCHKE), A., i, 533.
- Sulphonic acid**, $C_6H_5O_3NS$, barium salt of, from reduction of *o*-benzoylbenzoic acid anhydride (ROSE), A., i, 572.
- Sulphonic acid**, nitroso- (MANCROFT), A., i, 107; (RASCHIG), A., ii, 200.
- Sulphonic acids**, preparation of, in the free state (KASTLE), A., i, 50.
- Sulphonyl chlorides**, action of tertiary bases on (WEIGER and SCHENK), A., i, 190.
- Sulphonyl *p*-toluquinone**, bromo- (ZINCK and BRUNE), A., i, 197.
- Sulpho *p*-toluolide** (WOHL and KORN), A., i, 37.
- Sulphur and nitrogen**, relative atomic weights of (BURT and UNDER), A., ii, 389.
- mutual behaviour of tellurium and (CHIKASHIRI), A., ii, 978.
- equilibrium of (SMITH), A., ii, 1077.
- equilibrium of the modifications of (SMITH and CARSON), A., ii, 977.
- heat content of forms of (LEWIS and RANDALL), A., ii, 371.
- relation between the triple points of (KEVIN), A., ii, 879.
- absorption of light by (WIGAND), A., ii, 1084.
- reversible reaction of, in light (WIGAND), A., ii, 878.
- action of, in the vulcanisation of rubber (BARY and WEYERHAUS), A., i, 1003.
- preparation of colloidal solutions of, by fractional coagulation (UPPER), A., ii, 388.
- colloidal (RAFFO and MANCINI), A., ii, 878.
- colours of (LIESEGANG), A., ii, 37.
- effect of, on sulphur metabolism (MALLARD), A., ii, 622.
- hydroxide, preparation and properties of (UPPER), A., ii, 971.
- liquid, surface tension of (RIMMER), A., ii, 258.
- and its compounds, action of, on hydrazine (EPHRAIM and PIOTROWSKI), A., ii, 275.
- direct combination of, with metals (GUMANN), A., ii, 481.
- action of, on aromatic sulphonates (BOESCHKE), A., i, 533.
- fundamental properties of (FOREMAN), A., ii, 222; (MADVILLE), A., ii, 129.
- required by farm crops (HART and PETERSON), A., ii, 431.
- Sulphur**, action of, in the intestine (FRANK), A., ii, 749.
- metabolism. See under Metabolism.
- in proteins (JOHNSON and BURNHAM), A., i, 696; (JOHNSON), A., i, 758.
- compounds, absorption spectra of (PERVIA), A., ii, 560.
- action of, on metabolism (JONES), A., ii, 742.
- volatility of (DREYFUS), A., ii, 1061.
- with phosphorus (MAY), A., ii, 434, 719.
- Sulphur monochloride**, action of, on benzene, chlorobenzene and toluene (BOESCHKE and KONING), A., i, 532.
- use of, in analysis of the rare earth minerals (HICKS), A., ii, 934.
- Thionyl chloride**, action of, on alcohols, in presence of a tertiary base (DREYFUS), A., i, 513.
- action of, on esters of hydroxyacids in presence of a tertiary base (DREYFUS), A., i, 517.
- action of, on optically active hydroxyacids and esters (McKENZIE and BARROW), T., 1910; T., 232.
- action of, on magnesium alkyl halides (OHNO), A., i, 286.
- action of, on metallic oxides (DREYFUS and BOURGEOIS), A., ii, 878.
- action of, on tellurium (v. HORVATH), A., ii, 598.
- Sulphuryl chloride**, action of, on α -dimethylpyrrole (COLACICCHI), A., i, 224.
- action of, on metals (NORTH), A., ii, 738.
- action of, on tellurium (v. HORVATH), A., ii, 598.
- Sulphides**, estimation of, in alkali cyanide (ROSSIERO), A., ii, 654.
- Sulphur dioxide**, orthobaric densities and the rectilinear diameter of, in the neighbourhood of the critical point (CARUSO), A., ii, 854.
- equilibrium of, with methyl alcohol (RAMEY and PAMPHIL), A., i, 414.
- liquid, electrical conductivity of solutions of (FRANKLIN), A., ii, 1052.
- absorption of, by caoutchouc and by blood charcoal (REYCHLER), A., ii, 19.
- action of, on ammonia (EPHRAIM and PIOTROWSKI), A., ii, 274.
- influence of organic liquids on the interaction of hydrogen sulphide (KLEIN), A., ii, 200.

Sulphur dioxide, action of, on magnesium alkyl halides (ODDO), A., i, 286.

reduction of, in the presence of nickel (NÉGI and ADICARY), A., ii, 107.

use of, in iodometric analysis (ELVOVE), A., ii, 148.

estimation of, in white wines (RICHTER), A., ii, 330.

trioxide, quantitative estimation of, in sulphuric acid (FINCH), A., ii, 150.

Sulphurous acid, velocity of the reaction between iodic acid and (PATTERSON and FORSYTH), P., 320.

Sulphuric acid, molecular weight and constitution of (ODDO and ANELLI), A., ii, 177.

dissociation of (DRUCKER), A., ii, 687; (ENKLAAR), A., ii, 1071.

physical properties of mixtures of ether and (POUND), T., 698.

ammonia and water, equilibrium in the system (VAN DORP), A., ii, 379.

and ethyl alcohol, equilibrium in the reaction between (KREMANN), A., ii, 28.

and methyl alcohol, equilibrium in the reaction between (KREMANN and NEUMANN), A., ii, 28.

oxidation of hydrogen by (MILBAUER), A., ii, 872.

interaction of aromatic disulphides and (PRESCOTT and SMILES), T., 640; P., 65.

interaction of aromatic disulphides and (HILDITCH), T., 1091; P., 139.

action of, on *p*-tolyl ethyl ether (ROBERTS and ALLEMAN), A., i, 369.

theory of the lead chamber process for (RASCHIG), A., ii, 272; (WENTZKE), A., ii, 273, 878; (DIVERS), A., ii, 596.

organic catalytic reactions of (ODDO), A., i, 943.

estimation of, gravimetrically (KLEIN), A., ii, 822.

and sulphates, estimation of, volumetrically (AUCER and GABILON), A., ii, 330; (REPITON), A., ii, 331.

estimation of, in rain water (WITTYNJ), A., ii, 432.

estimation of, in soils (DE SORNAY), A., ii, 1027.

estimation of sulphur trioxide in (FINCH), A., ii, 150.

Sulphur:—

Sulphates, exact estimation of (STON and ADAMS), A., ii, 772.

Persulphates, organic, of metals (BARRIER and CAZ), A., ii, 889.

Hypersulphurous acid, constitution and dissociation of, compared with analogous sulphur oxides (JELLISKE), A., ii, 278.

Hyposulphites, preparation of, and their equilibrium with sulphur (JELLISKE), A., ii, 278.

electrolytic, preparation of (NEK), A., ii, 482.

potential of reactions of (JELLISKE), A., ii, 375.

Thiosulphates, detection of (LARI), A., i, 197.

Thionates, reactions of (FER), A., 289.

Dithionio acid, velocity of dissociation of (MULLER), A., ii, 106.

Pentathionic acid, occurrence in natural waters (MACLAUGHLIN), P., 533.

Sulphur, estimation of (ANELLI), A., ii, 533.

estimation of, in brass (THURNAUER), A., ii, 156.

estimation of, in coal (WATKINS), A., ii, 438.

estimation of, in coal gas (BARTON), A., ii, 534.

estimation of, in iron and steel (WIMMANN), A., ii, 1028.

estimation of, volumetrically, in steel (ELLIOT), A., ii, 117.

apparatus for estimation of, in steel (WENNMANN), A., ii, 933; (JABOULAY), A., ii, 664.

estimation of, in metal-bismuth (FAY), A., ii, 410.

free, estimation of, in mineral waters (W.), A., ii, 1130.

estimation of, in organic compounds (WAKUNIS), A., ii, 67.

estimation of, in petroleum (SANDERSON), P., 329.

sublimed, estimation of, in a mixture of different sulphurs (TAYLOR and GRIFFET), A., ii, 533.

estimation of, in tissues (WILSON and OSTERBERG), A., ii, 67.

estimation of, in urine (DENIS), A., ii, 66; (SCHMIDT), A., ii, 67; (DICT), A., ii, 330; (SMITH), A., ii, 626.

Sulphur organic compounds, estimation of (ZINCKE), A., i, 368.

Sulphides, aromatic, electrolytic estimation of (FICHTER and SCHMIDT), A., i, 41.

- Sulphuric acid.** See under Sulphur.
- Sulphur insulation, effect of light on** (BATES), A., ii, 836.
- Sulphuryl chloride.** See under Sulphur.
- Sundew.** See *Helianthus*.
- Suprarenal glands, constituents of the** (LOHMANN), A., ii, 630.
- Temperature action of the** (STUDZINSKI), A., ii, 599.
- Surface energy, molecular, of organic substances, abnormal temperature-coefficients of the** (WALDEN), A., ii, 97.
- Surface tension, measurements of** (MAGINI), A., ii, 258.
- Measurement of, by the method of capillary rise** (VERSCHAFFELT and VAN DER NOOT), A., ii, 701.
- At contact of two liquids** (VAN DER NOOT), A., ii, 559.
- Suspensions, viscosity of** (HASEGAWA), A., ii, 1067.
- Sweat, elimination of nitrogen, sulphur and phosphorus in human** (TAYLOR), A., ii, 397.
- Syphilis, mercury therapeutics of** (KUNOSY and LEVADITI), A., ii, 912.
- Syphilis reaction, action of cholesteroid and its derivatives in the** (BROWNS), and (CHURCHMAN), A., ii, 1014, 1115.
- Syringoloxystyrene acid** (FISHER, FELDNER, and LEISHER), A., ii, 875.
- Syrup, estimation of ash and sugar in** (MAINA), A., ii, 446.
- Extraction of gum in** (ROQUESS and SELLER), A., ii, 775.
- System, absorption, general phase theory for** (PAWLOFF), A., ii, 99.
- Two-component, space figure for** (WHITTE), A., ii, 1064.
- Disperse** (V. WEIMANN), A., ii, 381.
- Application of the phase rule to** (PAWLOFF), A., ii, 27.
- Condensed** (PAWLOFF), A., ii, 265.
- Heterogeneous, formation of layers in** (HATSECKA), A., ii, 972.
- Velocity of reaction in** (ROSELLI), A., ii, 196, 265.
- Reactions in, and the influence of alcohol on the same** (JARECZYNSKI and JARONSKI), A., ii, 27.
- Tanacetone, hydrazone of, and its derivatives** (KJERN), A., i, 71.
- d-Tanacetyl alcohol (d-thajol alcohol) and its derivatives** (PAGINO), A., i, 731.
- Tan liquors, estimation of, electrometrically** (SAND and LAW), A., ii, 243.
- Estimation of acids in** (PROCTOR and SKEMMER JONES), A., ii, 76.
- WOOD, SAND, and LAW**, A., ii, 942.
- Tannin, composition of** (STEINKOFF and SARGARIAN), A., i, 1004.
- In plant cells** (LOEW and BOKORNY), A., ii, 324.
- In ripening fruits** (LATO), A., ii, 918.
- In the roots of** (FISCHER), A., ii, 325.
- Solutions, reactions of** (GRASSER), A., ii, 1049.
- Estimation of, by means of casein** (NIEKENSILIN), A., ii, 236.
- Estimation of, by means of nickel hydrazide** (SINGH), A., ii, 910.
- Estimation of, by means of the refractometer** (FALCIGA and COHEN), A., ii, 163.
- Estimation of, in wines** (MALVEZIS), A., ii, 778.
- Glycerol and tartaric acid, estimation of, in liquids** (HINARD), A., ii, 942.
- Tannins** (NIEKENSILIN), A., ii, 282.
- Tartaric acid.** See under Tartarum.
- Tantalum, atomic weight of** (CHASTIN and SMITH), A., ii, 899.
- Melting point of** (V. PIRANI and MEYER), A., ii, 899.
- Solubility of hydrogen in** (STEVENS and REINSPER), A., ii, 990.
- Estimation of, and columbium** (FOOTE and LANGLEY), A., ii, 71, 72.
- Tantalum acid and its sodium salt, preparation of, from natural sources** (WEDERKIND and MAASS), A., ii, 44.
- Tar on roads, effect of on vegetation** (MERANDE), A., ii, 44.
- Tartrilolyl chloride, di-iso-** (HOFFMANN-LE ROUX & Co.), A., i, 691.
- "Tartar," dental, formation of** (BARTLE), A., ii, 741.
- Tartaric acid, di-benzylamides of** (FRANKLAND), T., 1782; P., 206.
- Salts of** (HILDEBRAND), T., 236.
- Basic barium salts of** (QUARTAROLI), A., i, 176.
- Cupric salts of** (PICKERING), T., 169; P., 7.
- Potassium salt, action of the oxides of lead on** (KRAUSKOPF), A., i, 519.
- d-Benzyl esters of** (PICKARD and KENTON), T., 68.
- Action of, on starch and dextrin** (OCHSNER DE CONINCK and RAY-SARD), A., i, 771.

T.

Tagayass "wood, causing influenza" (SUGIYAMA), A., i, 793.

Tanacetogenecarboxylic acid, methyl ester (SEMMLER and MEYER), A., i, 733.

Tanacetone, detection of, in absolute (KZ. PHILIPP and V. FELLEBERG), A., ii, 1049.

Tartaric acid, estimation of (ORDON-NEAU), A., ii, 77; (HECZKO), A., ii, 341, 342.

estimation of, in fruits and their juices (WARCOLLIER), A., ii, 1038.

estimation of, in tartrates and in wines (KLING), A., ii, 666.

estimation of, in wine residues (CARLES), A., ii, 342.

glycerol and tannin, estimation of, in liquids (HINARD), A., ii, 942.

Tartaric acids, behaviour of, in the organism (NEUBERG and SANAYOSHI), A., ii, 1016.

Tartrates, fermentation of (ORDON-NEAU), A., i, 429.

estimation of (TOBLER and CARAMELLI), A., ii, 447.

Tate's laws and the weight of a falling drop (MORGAN), A., ii, 372, 584; (MORGAN and THOMSEN), A., ii, 584; (MORGAN and DAGHLIAN), A., ii, 585; (MORGAN and SCHWARTZ), A., ii, 698; (MORGAN and CANN), A., ii, 699; (MORGAN and MCAFEE), A., ii, 857; (MORGAN and OWEN), A., ii, 1067.

Tautomeric compounds, thermochemical characteristics of (SVETOSLAVSKY), A., ii, 188.

Tautomerism, studies on (KNORR, ROTHE, and AVERBECK), A., i, 516; (KNORR and FISCHER), A., i, 976; (KNORR and SCHUBERT), A., i, 948. keto-enolic (MEYER), A., i, 350, 833, 865; (MEYER and KAPPELMEIER), A., i, 832.

Tektites, gases enclosed in (BECK), A., ii, 292.

Telluric acid. See under Tellurium.

Tellurium, pure, preparation of (SCHELLE), A., ii, 388.

complexity of (HARCOVERT and BAKEN), T., 1311; P., 137.

mutual behaviour of sulphur and (CHIKASHIKI), A., ii, 978.

action of sulphuryl and thionyl chlorides on (v. HORVATH), A., ii, 598.

Tellurium, alkylammonium salts of (GUTHRIE and FLURY), A., i, 132.

Tellurium alloys with cadmium and with tin (KOBAYASHI), A., ii, 40.

with gold (CORTE), A., ii, 405.

with zinc (KOBAYASHI), A., ii, 1089.

Telluric acid, oxalato-salts of (ROSENHEIM and WEINHEBER), A., i, 109.

estimation of, volumetrically (ROSENHEIM and WEINHEBER), A., ii, 151.

"-am organic compounds, aromatic esters (FELDER), A., i, 857.

Tellurium, estimation of, gravimetrically (ROSENHEIM and WEINHEBER), A., i, 151.

Temperature. See under Temperature chemistry.

Terephthalic acid, di-tert-butyl ester (PFANNL), A., i, 781.

Terephthaloyl bromide, estimation of (and CLAR), A., i, 638.

Tertiary systems (BONNEFANT), A., i, 476.

crystallisation in (PARLAGE), A., i, 794, 795.

of silver and lead (MATTHES), A., ii, 476.

Terpenes, chemistry of the (HARRIS and SUTHERLAND), T., 211; (HENDERSON and HARRIS), T., 1887; P., 248; (HARRIS and BOYD), T., 2159; P., 2160.

synthesis of the (LUFF and PETER), T., 518; P., 57; (CHURCHILL and KIN), T., 526; P., 57; (HARRIS), T., 727, 741; P., 95.

and ethereal oils (WALLACH), A., 310, 312, 469, 473, 891.

heats of combustion of (ROTH and EISENBERG), A., 1065.

preparation of isoprene from (INGEN and KLEVER), A., i, 976.

decomposition of, by glowing wires (HARRIS and GORDON), i, 798.

action of iodine on (CANNON), A., i, 218.

reduction of (IPATIEFF), A., i, 548.

cis-Terpin hydrate, decomposition of (LEULIER), A., i, 548.

Terpineol nitrosoazide (FOSTER and NEWMAN), T., 250; P., 10.

Testis, constituents of the (LOEWEN), A., ii, 630.

neutralisation of spermatophores (alkaloids by extract of (NIKOFF), A., ii, 217.

Tetanus toxin, combination with other substances (LOEWEN), A., 638, 912.

Tetra-acetylgluco-p-hydroxybenzoic acid, methyl ester (MAITNER), A., i, 647.

Tetra-acetylglucosamine methylglucoside (HAMLIN), A., i, 529.

Tetra-acetylglucovanillic acid, methyl ester (MAITNER), A., i, 647.

Tetra-alkylsilicane (BYGREN), A., 845.

γ-Tetrabenzo-1-β phenylpropane (DIECKMANN and V. FISCHER), A., 452.

Tetracinnamylammonium hydrate (EMDE and SCHELLBACH), A., i, 151.

- Tetra-4-diphenylethane** (SCHLENK, KENNING, and RACKY), A., i, 596.
- Tetra-4-diphenylethane** (SCHLENK, KENNING, and RACKY), A., i, 596.
- Tetraphenylhydrazine** and its hydrochloride (WIELAND and SÜSSER), A., i, 551.
- Tetraethylheptan-8-ol** and its phenylurethane (ZERNER), A., i, 950.
- Tetraethylheptan-8-one** (ZERNER), A., i, 953, 950.
- Tetraethylthiocarbamide** (DELPEINE), A., i, 54.
- Tetraethylsuccinic acid** (NIERENSTEIN), A., i, 382.
- Tetrahydrobenzaldehyde**, preparation of (BOESCHKE and SCHMIDT), A., i, 59.
- Tetrahydrobenzothiofuran** (*thiochroman*) and its derivatives (V. BRAUS), A., i, 176.
- Tetrahydroberberine methiodide** (GILCHRIST), A., i, 153.
- Tetrahydrocarvone**, oxime and semicarbazone of (WALLACH), A., i, 470.
- Tetrahydrodicarvone** (WALLACH), A., i, 471.
- Tetrahydro- β -naphthylamine**, influence of, on temperature and respiratory exchange (MILCH and PEMBERTON), A., ii, 1017.
- Tetrahydrochloride**, effect of injecting (BLACK), A., ii, 638.
- Tetrahydropiperic acid** and its derivatives (BOESCHKE), A., i, 1918.
- Tetrahydropiperine** (SKITA and TSUNO), A., i, 1017.
- Tetrahydroquinazoline**. See 2-Methyl-2-tetrahydroquinoline.
- Tetrahydro- α -quinoline, 7-hydroxy**, and its salts (PICTET and STENGLEB), A., i, 750.
- Tetrahydro- α -quinoline-3-carboxylic acid**, and 7-hydroxy- (PICTET and STENGLEB), A., i, 750.
- Tetrahydro-2'-thio-6'-pyrimidonethiol-1,6-dihydro-6-pyrimidone** (JOHNSON and SHEPARD), A., i, 921.
- Tetrahydro-4-carboxylic acid** and its potassium salt (BENARY), A., i, 672.
- 2,4'- and 3,4,3':4'-Tetramethoxybenzophenone** (KATFMANN and KUGEL), A., i, 939.
- 2,4'-Tetramethoxybenzophenone** and its phenylhydrazine (BARGELLINI and SCOGNANI), A., i, 966.
- 2,4,6'-Tetramethoxychalcone** (BARGELLINI and BENI), A., i, 212.
- 2,4,5-Tetramethoxychalcone** (BARGELLINI and AVERUTI), A., i, 68.
- Tetramethoxydiphenylmethane** (HARWIN, KUNZOFF, SAUROFF, ANDRUS, BERNKOPF, and DMITRIYEV), A., i, 656.
- 3,4,6,8-Tetramethoxyphenanthrene-9-carboxylic acid** and its methyl ester (PSCHORR and KNÖFFLER), A., i, 669.
- 4,4':4''-Tetramethoxytetraphenylethylene** (STAUDINGER, CLAR, and CZAKO), A., i, 625.
- 4,7,7-Tetramethylacetacetic acid** and its ethyl ester (WAHLBERG), A., i, 707.
- 1,3,6,8-Tetramethylallantoin**, and 7-thio- (BILIZ and KREIST), A., i, 242.
- α -Tetramethyl- β -diaminodiphenyl- γ -diphenylmethylenes Δ^6 -pentadiene** (STAUDINGER and KUN), A., i, 879.
- Tetramethyl- β -diaminodiphenyl ketone** hydrate and its benzoylene derivative and ketazine (WIELAND and ROSETH), A., i, 572.
- Tetramethyl- β -diaminotetraphenylethylene** (STAUDINGER and KUN), A., i, 879.
- Tetramethylammonium chloride**, physiological action of (MARSHALL), A., ii, 754.
- hypenitrite**, decomposition of, by heat (RAY and SEXTON), T., 1466; P., 121.
- nitrite**, decomposition of, by heat (RAY and SEXTON), P., 4.
- 6,3,3-Tetramethylamylene- β -glycol** (RICHARD), A., i, 8.
- 3,4,3':4'-Tetramethyldiphenyl- and amino-, 6-nitro-, and tetranitro-, and their derivatives** (CROSSLEY and HANSHIEB), T., 721; P., 90.
- Tetramethylenediamine**. See Butane, α -diamino.
- Tetramethylethylenediamine** and its platinumchloride (SKRAFT and PHILIPPI), A., ii, 588.
- Tetramethyl glucose**, nitrogen derivatives of (LEWIS and HYND), T., 167; P., 9.
- 4,3,3'-Tetramethylguanidine aurichloride** (SCHENCK), A., i, 843.
- Tetramethyl- β -heptadiene** (RUPK and KERRIGAN), A., i, 818.
- Tetramethyl- α -heptatriene** and its dihydrochloride (RUPK and KERRIGAN), A., i, 847.
- Tetramethyl- γ -cyclohexandione** and its semicarbazone (BAMBERGER and BLANCY), A., i, 883, 884.
- Tetramethylorcinol, dibromo-**, and its derivatives (HERZIG, WENZEL, ZEIDLER, and SCHWABEN), A., i, 777.
- 1,2,2,3-Tetramethyl-4-cyclopentanol** and its phenylmethane (LOQUIN), A., i, 792.
- 1,2,2,3-Tetramethyl-4-cyclopentanone** and its semicarbazones (LOQUIN), A., i, 792.
- 2,3,3,4-Tetramethyl- Δ^1 -cyclopentenone-5**. See 2-Methyl-laurenone.

acet-Tetramethylpimelamide (HALLER and BAUER), A., i, 652.
 1:2:4:6-Tetramethylpyridinium perchlorate (v. BAEYER and PICCARD), A., i, 901.
 1:2:6:8-Tetramethyltetrahydroquinoline and its salts (JONES and EVANS), T., 337.
 Tetramethylthiocarbamide, methiodide of (DELÉPINE), A., i, 23.
 Tetramethylisothiocarbamide and its picrate (DELÉPINE), A., i, 23.
acet-Tetramethylpimelic acid (HALLER and BAUER), A., i, 652.
 Tetramic acid and its oximino-derivative (BENARY), A., i, 673.
 Tetraoxy-2-methylthiophen and tri-bromo-, tetrabromide, and polynitro- (LANFRY), A., i, 1009.
 Tetraoxythiophen and its octabromide (LANFRY), A., i, 740.
 Tetraphenylacetone (STAUDINGER and GÖLLER), A., i, 307.
 2,2,4,4-Tetraphenylcyclobutan-1:3-dione (STAUDINGER and GÖLLER), A., i, 306.
 Tetraphenylchloro- and *m*-dichloroquinodimethane (STAUDINGER and BEREZA), A., i, 462.
 Tetraphenyldihydrotriazole (BUSCH and RUPPENTHAL), A., i, 87.
 Tetraphenylmethane, *o*-bromo-, *o*-chloro-, and *di-p*-chloro-*o*-bromo- (GOMBERG and VAN SLIKE), A., i, 361.
 Tetraphenylmethane, 4:4':4''-tetra-chloro-, and its dichloride (NORRIS, THOMAS, and BROWN), A., i, 32.
 1:2:4:6-Tetraphenyglyoxalino and its salts (EVEREST and MCCOMBIE), T., 1748; P., 209.
 Tetraphenylhydrazine (WIELAND), A., i, 569.
 Tetraphenylmethane, dihydroxy- (v. MEYER and FISCHER), A., i, 121.
acet-Tetraphenyl- Δ^6 -ponton-e-ol (REYNOLDS), A., i, 861.
 Tetraphenyltolquinodimethane (STAUDINGER and BEREZA), A., i, 462.
 Tetrapropylthiocarbamide (DELÉPINE), A., i, 23.
 Tetrapropylisothiocarbamide (DELÉPINE), A., i, 23.
 Tetra-*p*-tolylpyrazine (CURTIUS and KASTNER), A., i, 325.
 Tetradon poison (TAHARA), A., ii, 133.
 Tetradopentose (TAHARA), A., ii, 133.
 Tetrolaldehyde (Δ^6 -butinal) and its oxime (CLAISEN), A., i, 492.
 and its derivatives (VIGUIER), A., i, 522.
 Thalleioquinine, and its salts (COMAN-NUCCI), A., i, 317.

Thallium, crystallographic (v. WALLACE and WALLACE), A., ii, 113.
 Thallium alloys with calcium, manganese (BAER), A., ii, 113.
 Thallous hydroxide- (BAER), A., ii, 803.
 cerous nitrate (JANISCHKE and DOROW), A., ii, 113.
 lanthanum nitrate (JANISCHKE and WIGDOROW), A., ii, 113.
 sulphate, trans-ferrous (JANISCHKE with (KALK), A., ii, 113.
 Thallium ion, measurement of potential of the (SPENCER), A., ii, 113.
 Tharmanite from Beaver Creek (BUTLER and SCHAEFER), A., ii, 209.
Thea Sasangua, oil from (KUMAR), A., i, 388.
 Thebaine, physiological action of (DEBRANDT), A., ii, 517.
 oxide and its hydrochloride (DEBRANDT and SPEYER), A., i, 77.
 Thebaine, physiological action of (DEBRANDT), A., ii, 517.
 Theobromine, degradation of (DEBRANDT and TOPP), A., i, 692.
 and caffeine, estimation of (DEBRANDT), A., ii, 573.
 Theophylline, coupling of, with *p*-substituted dichloroaniline (KALNAY), A., i, 507.
 Thermal analysis. See ANALYSIS.
 Thermic reactions. See THERMAL CHEMISTRY.
 THERMOCHEMISTRY:--
 Thermochemical character of tautomeric compounds (v. SLAVSKY), A., ii, 188.
 investigations (AUWERS, EISENLOHR), A., ii, 188.
 studies (SVETOSLAVSKY), A., ii, 987.
 Thermodynamic chemistry of complex systems of van der Waals, A., ii, 256.
 Thermodynamics of solution (COHEN), A., ii, 189.
 and the kinetic theory of (BERTHOUD), A., ii, 57.
 Heat, conduction of, through gases (SODDY and BELL), A., ii, 253.
 relation of, to muscular work (HILL), A., ii, 215.
 Thermal conductivity of metals (EUCKEN), A., ii, 189.
 reactions in a vacuum (WILSON and ELLIS), A., ii, 395.
 Specific heat, theory of (NEERST and MANN), A., ii, 1059.

THERMOCHEMISTRY:—

- Specific heat, at low temperatures** (POLLITZER), A., ii, 189; (NERNST), A., ii, 368; (LINDEMANN), A., ii, 369; (NERNST and LINDEMANN), A., ii, 466; (KORFF), A., ii, 964;
of gases (THIRAUT), A., ii, 695;
 (DRUCKER), A., ii, 792;
of liquids, determination of (MEL-ROSE), A., ii, 851;
of solids at low temperatures (BALSCHALL), A., ii, 580;
 relation between, and elastic properties of solids with monatomic molecules (FINSING), A., ii, 186;
of solutions, calculation of (PASCH), A., ii, 851;
Atomic heat of the elements (KORFF), A., ii, 960;
Molecular heat of fusion (BALD), A., ii, 581;
Heat of admixture of substances (KILMAN), A., ii, 371;
Heat of combustion of compounds of physiological importance (EMERY), A., ii, 857;
Heat of evaporation, determination of, water and other liquids (RICHARDS and MATHEWS), A., ii, 692;
Heat of fusion of substances melting near atmospheric temperature (LIGINIS and DEBOND), A., ii, 692;
Heat of neutralization, measurement of by means of a Dewar flask (MATHEWS and GERMANN), A., ii, 187;
Heat of reaction in non aqueous solutions (MATHEWS), A., ii, 855;
Heat of vaporisation, electrical determination of (NAGORNOFF and ROBINZAN), A., ii, 965;
 relation of, to other physical constants (MONTGOMERY), A., ii, 965;
vapour pressure, and temperature, relation between (CEDEBERG), A., ii, 854;
about, of liquids, calculation of (THORKESSON, LEWIS), A., ii, 855;
 in mixed liquids (TYLER, T.), 1633; P., 215, 319;
Temperature, bath for maintaining constant (MORGAN), A., ii, 381;
 relation of osmotic pressure to (MOSEY, HOLLAND, and CARPENTER), A., ii, 375; (MOSEY, HOLLAND, and ZIEGLER), A., ii, 473; (MOSEY, HOLLAND, ZIEGLER, MYERS, CLARK, and GILL), A., ii, 701.

THERMOCHEMISTRY:—

- Temperature, heat of vaporisation and vapour pressure, relation between** (CEDEBERG), A., ii, 854;
 low, calculation of (ONNES), A., ii, 368;
 optimum, for physiological processes (VAN AMSTEL and VAN IJCKSON), A., ii, 319;
Calorimeter, simple combustion (WRIGHT), A., ii, 1064;
 copper, measurement of specific heat with the (KORFF), A., ii, 964;
Thermometer, electric signal (MICHEL), A., ii, 963;
 platinum, comparison of the hydrogen, helium, and nitrogen-thermometers (HOLMORS and HENNING), A., ii, 850;
Thermometry, use of the transition temperatures of sodium chromate in (RICHARDS and KELLEY), A., ii, 695;
Thermoregulator, Reichert, modification of the (FONSTANE), A., ii, 252;
Thermostat, transparent (PATOMAA), A., ii, 461;
Thermodynamics See under Thermochimistry;
Thermoelectric properties. See under Electrochemistry;
Thermoregulator. See under Thermochimistry;

Thermotropy and phototropy, studies in (SENDEL and CLARKE), T., 2081; P., 260;
Thianthren and its derivatives, and 4-chloro-, and 4,4'-dichloro- (FRIES and VOGT), A., i, 555;
 isomeric disulphoxides from (FRIES and VOGT), A., i, 395;
Thianthren 2,6 diphthaloyloic acid (SCHOLL and SEER), A., i, 557;
Thianthren 2 phthaloyloic acid (SCHOLL and SEER), A., i, 557;
Thiazole thioindigo derivatives, preparation of (KALLER & CO.), A., i, 678;
Thienyl methyl ketone, action of carbon disulphide and potassium hydroxide (KELKER and SCHWARZ), A., i, 740;
Thioamide (JOHNSON and BURHAM), A., i, 712;
Thiobenzamide, condensation of, with benzonitrile (MAISCH), A., i, 201;
Thioheptanilide, preparation of (BARNETT), P., 8;
 action of hydrogen dioxide on, and formation of its oxide (LEETZ and BARNETT), P., 129.

- Thiobenzoyl disulphide**, *o*-hydroxy-, and its acetyl derivative (HORN and BLOCH), A., i, 49.
- Thiocarbamide**, condensation of, with esters of allylmalonic acid (JOHNSON and HILL), A., i, 502.
- †Thiocarbamides**, aromatic, and their conversion into aryl orthothiocarbonates (ARNDT), A., i, 918.
- trans-β-Thiocarbiminoacrylic acid** (JOHNSON and SHEPARD), A., i, 924.
- Thiocarbonic acid**, chloro-, methyl and propyl esters (DELEPINE), A., i, 944.
- Thiochroman**. See Tetrahydrobenzthiopyran.
- Thiocyanates**, aromatic, action of ammonia on (STRZELECKA), A., i, 196.
- estimation of (RONNET), A., ii, 938.
- Thiodinaphthantraquinonylamine** (SCHOLL, SEER, and TRITSCH), A., i, 559.
- Thiodiphenylamine 2:7-diphthaloylic acid** (SCHOLL and SEER), A., i, 559.
- Thiodiphenylenephenetylsulphonium platini-chloride** (HILDITCH), T., 1096.
- Thioformoxamio acid**, metallic salts and benzyl ester of (CAMBI), A., i, 429.
- Thioglycylglycinethioamide** (JOHNSON and BURNHAM), A., i, 712.
- Thiohydantoin** and its potassium salt (KOMATSU), A., i, 683.
- “Thioindigo.”** See Bisoxxythionaphthen.
- 2-Thiol-4(or 5)-aminomethylglyoxaline** and its salts (PYMAN), T., 672; P., 91.
- Thiolbenzene**, 4:6-dichloro-1:3-dichloro-, and *o*-nitrochloro- (ZINCKE), A., i, 369.
- 5-Thiol-*o*-creosol**, 3-bromo-, and its diacetyl derivative (ZINCKE and BRUNKE), A., i, 197.
- Thioldiphenyl, 4:4'-dichloro-** (ZINCKE), A., i, 369.
- β-2-Thiolglyoxaline 4-acrylic acid** (BARGER and EWINS), T., 2338; P., 305.
- α-Thiol-*p*-methoxycinnamic acid**, disulphide and its benzyl derivative (BUTSCHER), A., i, 333.
- Thiophenylglyoxylic acid**, phenylhydrazone of, and its derivatives (AUWERS and MÜLLER), A., i, 586.
- Thiophthalic acid**, esters of (REISSERT and HOLLE), A., i, 981.
- 2-Thiol 4(or 5)-thiocarbamidomethylglyoxaline** (PYMAN), T., 672.
- γ-Thiol-*n*-valerylcarbamide** (JOHNSON and HILL), A., i, 503.
- Thionaphthen derivatives**, preparation of (KALLE & Co.), A., i, 667.
- Thionaphthen-2-aldehyde**, and its derivatives (FELDMAN and KIELBASINSKI), A., i, 564.
- Thionaphthen-3-aldehyde**, and its derivatives (FELDMAN and KIELBASINSKI), A., i, 564.
- (1-Thionaphthen-2-carboxylic acid hydroxy-, preparation of, and alkylthio- derivatives** (FELDMAN & Co.), A., i, 566.
- Thionaphthenphenylosotrazon** (AUWERS and MÜLLER), A., i, 586.
- Thionaphthenquinone**, azones and osazones of (MÜLLER), A., i, 586.
- 3-(1'-Thionaphthenyl)-indole-2-thione** (PUMMERER and GÖTTLER), A., i, 222.
- 3-(1'-Thionaphthenyl)-indole-2-methylamino-2-anil-1-thione** (GÖTTLER), A., i, 222.
- Thionates**. See under Sulphur.
- Thiobenzoic acid**, methyl ester of (DELEPINE), A., i, 768.
- Thionobutyric acid**, methyl ester of (DELEPINE), A., i, 768.
- Thiocarbonic acid**, methyl ester of (CHEMISCHE FABRIK LAG), A., i, 438.
- 3-Thion-1:4 diphenyl 2-methylamino-1-thione** (BUTSCH and LINNACH), A., i, 586.
- Thionocyclohexoic acid**, methyl ester of (DELEPINE), A., i, 768.
- Thionocetic acid**, methyl ester of (DELEPINE), A., i, 768.
- Thionoisovaleric acid**, methyl ester of (DELEPINE), A., i, 768.
- Thionyl chloride**. See under Sulphur.
- Thiophen 2-aldehyde**, preparation of, and its derivatives of (GRISHKEVICH and CHIMOWSKY), A., i, 181.
- Thiophenoquinones**, reduction of (POSNER), A., i, 551.
- Thiophosphoric acid**. See under Sulphur.
- 2-Thiopyrimidine 5-carboxylic acid and amino-**, and its ethyl ester, chloride (JOHNSON and AVANT), A., i, 576.
- Thiopyrine**. See 1-Phenyl-2:4-dipyrzolonone, 2:5-thio-.
- †Thiopyrine**. See 5-Methyl-1-phenyl-3-methylpyrazolonone.
- Thioquinoline** and its salts (N and STEUER), A., i, 163.
- Thioquinolinecarboxylic acid** (N and HEEZRAUM), A., i, 163.
- Thiosemicarbazylcamphorformazan-2-carboxylactimide** (BATES), A., i, 55.
- Thiosemicarbazylcamphorformazan-2-carboxylic acid** and its salts (TINGLE and BATES), A., i, 55.

- Thiarsulphates.** See under Sulphur.
- Thiarsanthosol,** constitution of (HILDEBRAND and SMILES), T., 156.
- Thiarsanthosyl chloride and oxide,** HILDEBRAND and SMILES, T., 156; P., 3.
- Thioxanthone,** synthesis of derivatives of CHRISTOPHER and SMILES, T., 2046; P., 265.
- Thioxanthone, 2-amino-, and hydroxy-** CHRISTOPHER and SMILES, T., 2046.
- Thionin, and chlorohydroxy-, and its sodium salt** MARSDEN and SMILES, T., 1356.
- Thiothiols,** (CLARKE and SMILES), T., 1338; P., 212.
- Thiothiols, synthesis of, and its trimethyl ether** ULLMANN and SENE, A., i, 739.
- Thioxanthones, nitro-, preparation of** GREENFARIGEN VORM. F. BAYER AG., A., i, 450.
- Thioxanthonium chloride and ferriehloride** HILDEBRAND and SMILES, T., 157; P., 4.
- Thomsonite** from New Jersey (CANFIELD), A., ii, 615.
- Thorium and its disintegration products** LEVINE, A., ii, 1018.
- transport of the active deposit of** WILLIAMS, A., ii, 358.
- stays from the active deposit of** (V. BAYER, HAHN, and MEISNER), A., ii, 567.
- gamma of** (RUSSELL and SIDDONS), A., ii, 22.
- biology of** ROSSER, A., ii, 1117; (V. BOLLON), A., ii, 1118.
- emanation, molecular weight of** (LEVINE), A., ii, 813.
- salts, action of the radium emanation on** (HILDEBRAND and RAMSAY), A., ii, 813.
- Thorium arsenates** (BARRIER), A., ii, 207.
- carbonates** CHAUVENET, A., ii, 806.
- chloride, dissociation of the compound of ammonia with** CHAUVENET, A., ii, 806.
- peroxide** (CATZARANI), A., ii, 301.
- torium, detection and estimation of, by means of telluric acid** (MEYER), A., ii, 825.
- proglobulin of the pig, histidine in** (K. H.), A., i, 496.
- thujone** (TSCHUGAEFF and FOMIN), A., i, 72.
- transformations of** (KIENER), A., i, 996.
- thujone, bromides of** (KIENER), A., i, 72.
- thujones, reduction of** (TSCHUGAEFF and FOMIN), A., i, 72.
- Thujorodin** (TAYLOR), A., i, 395.
- Thujyl alcohol.** See Tanacetyl alcohol.
- Thujylhydrazine** (KIENER), A., i, 71.
- Thulium, elements present in** (V. WELSH), A., ii, 607.
- and its salts** (JAMES), A., ii, 891.
- Thyma, Dalmatian white, constituents of the oil of** (PICKLES), P., 255.
- Thymic acid** (STRIDEL and BRIGLI), A., i, 342.
- Thymol, new isomerides of** (GILLAUD-MIN), A., ii, 318.
- diethylaminoethyl carbonate and its salts and chlorocarbonate** (EINHORN and ROTHLAUF), A., i, 704.
- Thymomenthyl** (HENDERSON and BOYD), T., 2161.
- Thymomenthone** (MURAT), A., i, 890.
- Thymomenthyl oxalate** (HENDERSON and BOYD), T., 2160; P., 276.
- Thymus, postolytic changes in the** (ROBIN), A., ii, 1112.
- Thyroid, constituents of the** (LOHMANN), A., ii, 630.
- internal secretion of the** (ANHE and FLACK), A., ii, 55.
- influence of the, on enzyme action** (JESCHITSCHENKO), A., ii, 1112.
- possible vicarious relationship between the pituitary and the** (SIMPSON and HUNTER), A., ii, 1112.
- estimation of iodine in the** (SEIDELL), A., ii, 926.
- Thyris splendens, pigmentation of** (GORISSE), A., ii, 908.
- Tiglylbenzene.** See Phenyl α -methylisopropyl ketone.
- Tilasite** from India (SMITH and PRIOR), A., ii, 1103.
- Tilia europae, phytosterol and its derivatives from** (KLOHN and GARNIER), A., i, 972.
- Tinacchi tenebreosa, composition of the secretion of** (CARLIER and EVANS), A., ii, 908.
- Tin, electrochemistry of** (FORSTER and YAMASAKI), A., ii, 576.
- vacuum distillation of** (TIEDE and FISCHER), A., ii, 731.
- the system lead, silver and** (PARRAVANO), A., ii, 281.
- action of seltzer water on** (BARILLE), A., ii, 859.
- compounds of, with arsenic** (JOLIBOIS and DEPEY), A., ii, 612; (PARRAVANO and DE CESARIO), A., ii, 613.
- chlorides, compounds of, with antipyrine** (ASTRE and VIDAL), A., i, 399.
- Tin alloys, with antimony** (KONSTANTINOFF and SMIRNOFF), A., ii, 1096.

- Tin alloys**, with cerium (VOGEL, A., ii, 1090.
 with copper and manganese, magnetic properties of (ROSE and GEAT, A., ii, 193.
 with lead (MAZZOTTO, A., ii, 889.
 with lead and antimony (LOEBE, A., ii, 204.
 with mercury and silver (JOYNER, T., 195; P., 5.
 with tellurium (KOBAYASHI, A., ii, 40.
 with zinc and lead (LEVI-MALVANO and CECCARELLI, A., ii, 1083, 1069.
 analysis of (KIEFERBER, A., ii, 158.
- Tin tetrahalides**, compounds of, with aldehydes (PFEIFFER, FRIEDMANN, GOLDBERG, PROS, and SCHWARKOFF, A., i, 789.
- Stannic bromide**, latent heat of fusion of (TOLLOZCOZ and MEYER, A., ii, 187.
tetrachloride, compounds of, with *o*-hydroxy-ketones (PFEIFFER, GOLDBERG, and KUNTNER, A., i, 899.
- Stannous chloride**, compounds of, with ammonia (SOFIANOPoulos, A., ii, 403.
 salts, detection of (DE GUZMAN CANANCIO, A., ii, 825.
- Tin organic compounds** (PFEIFFER, PRADÉ, and REKATE), A., i, 595; (EMMERT and ELLER), A., i, 846.
 halides, pyridine compounds of (PFEIFFER, FRIEDMANN, LEHNARDT, LUTTENSTEINER, PRADÉ, and SCHNURMANN), A., i, 746.
 diethyl, preparation of pure (PFEIFFER, PRADÉ, and REKATE), A., i, 595.
- Stanni-diacetic acid**, *di*-iodo-, ethyl ester (EMMERT and ELLER), A., i, 846.
- Stanni-di-*o*-benzoic acid**, *di*-iodo-, ethyl ester (EMMERT and ELLER), A., i, 846.
- Tin**, estimation of, in tin-plate (BEVERIDGE), A., ii, 543.
 separation of, and platinum (WÖHLER and SPENZEL), A., ii, 338.
- Tin ores**, decomposition of refractory (LORAM), P., 60.
- Tin-plate**, estimation of tin in (BEVERIDGE), A., ii, 543.
- Tinstone**, solution of (GILBERT), A., ii, 71.
- Tissues**, action of radium on normal (GRÜNBAUM and GRÜNBAUM), A., ii, 132.
 introduction of radium into the (HABET, DANNE, and JABOIN), A., ii, 418.
 irritable, relation of stimulation to changes of permeability in (LILLIE), A., ii, 750.
- Tissues**, action of radium on normal (GRÜNBAUM and GRÜNBAUM), A., ii, 132.
 for growth (GRÜNBAUM and GRÜNBAUM), A., ii, 132.
 muscular, differentiation of (GRÜNBAUM and GRÜNBAUM), A., ii, 132.

INDEX OF SUBJECTS

(Tolyl compounds, Me=1.)

- o*-Toluidine, 3-iodo-5-nitro- (WHEELER and HOFFMAN), A., i, 28.
- 5-iodo-3-, and 4-nitro-, and 4:5-di-iodo- (WHEELER and BRAUTLECHT), A., i, 27.
- m*-Toluidine, 2:5-di-iodo-, and 2:5:6-tri-iodo- (WHEELER and BRAUTLECHT), A., i, 27.
- 5:6-di-iodo-, 4:5:6-tri-iodo-, and 2:4:5:6-tetraiodo- (WHEELER and HOFFMAN), A., i, 28.
- o*- and *p*-Toluidine, compounds of, with antimony trichloride (MAY), T., 1384; P., 125.
- p*-Toluidine, 2:5-di-iodo- (WHEELER and BRAUTLECHT), A., i, 28.
- Toluidine series, pharmacological and chemo-therapeutic studies in the (HILDEBRANDT), A., ii, 514.
- o*-*p*-Toluidinoacetophenone, derivatives of (BURCH and HEFELE), A., i, 583.
- 1-*p*-Toluidinoanthraquinone, *o*-nitro- (ULLMANN and FODOR), A., i, 468.
- 4-*p*-Toluidinoanthraquinone-2:1-acridone (ULLMANN and BILLIG), A., i, 491.
- p*-Toluidino-1-anthraquinone-2-carboxylic acid (BADISCHE ANILIN- & SODA-FABRIK), A., i, 980.

- Triphenylacetoneitrile and its diacetyl derivative, FRIEDBERG, VAN ROSENTHAL, HILDEBRAND, A., i, 867.

- ylacetylphenylimine chloride** (BINGER, CLAR, and CZEKO, A., A., i, 32).
- yibenzene**, synthesis of (DEL, A., i, 32).
- yibenzylmethane** v. MEYER and FISCHER, A., i, 121.
- phenyl γ -butyrolactone** (REV, A., i, 361).
- yl-carbamide** (CHEMISKE LAPENBERG, A., i, 438).
- clearinol**, absorption spectra of (v. MEYER and WIELAND, A., i, 362).
- yl-amine** on (GREEN and CHAPPEL, A., i, 451).
- derivative of SCHLENK, MAIR, and BORNHARDT, A., i, 434.**
- clearinol**, α -bromo-, and β -bromo- (SCHLESCHIBABIN, A., i, 434).
- yl-chloro**, and β -chloro-, α -bromo-, and β -bromo-, and their derivatives (BING and VAN STYKE, A., i, 434).
- l-carbinol 4 carboxylic acid**, (v. STAUDINGER and CLAR, A., i, 639).
- yl-chlorobenzylmethane** v. MEYER and FISCHER, A., i, 121.
- l-dihydrotriazole** (BUSH and KNOTT, A., i, 57).
- phenyl 2,5 dihydro 1,2,3 triaz** (v. MEYER and FISCHER, A., i, 129).
- l-ethylene glycol**, acetyl deriva (PATRINO and GRIFFITH, A., i, 65).
- ylsulphide**, β -bromo- of (v. BUNARY, A., i, 300).
- benzylglyoxaline** and its salts (v. MORGAN and MCCORMIE, T., 2292; P., 274).
- methane**, preparation of de (v. of (FARNSFABER, A., i, 364).
- yl-bromo**, α - and β -chloro-, α -bromo- (SCHLESCHIBABIN, A., i, 434).
- yl and acetylo** (SCHLENK, and BORNHARDT, A., i, 434).
- methane 4 carboxylic acid**, β - and amide from (STAUDINGER and CLAR, A., i, 639).
- yl-methyl ester** and α -bromo- (STAUDINGER and CLAR, A., i, 639).
- yl-methyl** (GOMBERG and VAN STYKE, A., i, 361).
- yl-spectra** of (MEYER and FISCHER, A., i, 121).
- Triphenylmethyl**, colour of, in relation to dilution (PICCARD, A., i, 361).
- yl-methyl** (SCHLENK, MAIR, and BORNHARDT, A., i, 434).
- yl, α -bromo**, and β -bromo-, and α -chloro-, β -bromides (SCHLESCHIBABIN, A., i, 434).
- Triphenylmethylamine**, α -bromo-, β -chloro-, and β -p-chloro- and β -bromo- (GOMBERG and VAN STYKE, A., i, 361).
- Triphenylmethyl 4 carboxylanilide** (STAUDINGER and CLAR, A., i, 639).
- Triphenylmethyl 4 carboxylin acid**, β -methyl ester (STAUDINGER and CLAR, A., i, 639).
- Triphenylmethyl diphenylamine** (WIELAND and LUCHER, A., i, 370).
- Triphenylmethyl β -tolylamine** (WIELAND and LUCHER, A., i, 370).
- Triphenylmethyl ethyl sulphide** (v. MEYER and FISCHER, A., i, 121).
- 1,4,5 Triphenyl 2 methylglyoxaline** and its salts (PATRINO and MCCORMIE, T., 2292; P., 274).
- Triphenylmethylmethylcarbamide** (v. MEYER and FISCHER, A., i, 129).
- Triphenylmethyl methyl sulphide** (v. MEYER and FISCHER, A., i, 121).
- Triphenylmethylphthalimide** (v. MEYER and FISCHER, A., i, 129).
- Triphenylmethylpiperidine** (v. MEYER and FISCHER, A., i, 129).
- Triphenylmethylpyrrole** (v. MEYER and FISCHER, A., i, 129).
- Triphenylmethylthiocarbamide** (v. MEYER and FISCHER, A., i, 129).
- 3,4,5 Triphenyl oxazole** (HEIM, A., i, 718).
- Triphenyl α -phenylaminediamine** and its β -hydroxy- (v. WIELAND and LUCHER, A., i, 360).
- α , β -Triphenylpropene** (HEIM, A., i, 718).
- and Triphenylpropionic acid**, β -hydroxy-, and its silver salt (PATRINO and GRIFFITH, A., i, 65).
- α , β -Triphenylpropylene, α -nitro** (HEIM, A., i, 718).
- 1,4,5 Triphenylpyrazole** (WIELAND and LUCHER, A., i, 361).
- Triphenylsemicarbazide** (α -diphenyl-, β -diphenyl-, and γ -diphenyl-), and its derivatives (v. MEYER and NICOLAUS, A., i, 121).
- Triphenylallicol**, α -hydroxy derivative of (SCHLENK, BENNING, and BARRY, A., i, 360).
- Triphenylethine**, β -amino-, and α -hydroxy- (v. MORGAN and MCCORMIE, T., 2292; P., 274).

- Triphenyltetrakis(dihydroxide)trisulphonic acid and its salts** (MORGAN and MUKLETHWAIT), T., 2296.
- Triphenyltellurium salts** (LEDERER), A., i, 857.
- Triphenyl-*p*-tolylethylene** (STAUDINGER and KON), A., i, 878.
- Triphenyltriazolone** (BUSCH and RUPENTHAL), A., i, 87.
- Triphenyltribenzylmalamine** (v. MEYER and NABE), A., i, 122.
- Triphenyltrimethylmelamine** (v. MEYER and NABE), A., i, 122.
- Triple points** (JOUQUER), A., ii, 869.
- Tripropylthiocarbamide** (DELÉPINE), A., i, 23.
- Tripyridineferrii thiocyanate** (BARBIERI and PAMPANINI), A., i, 225.
- Triquinolineferrii thiocyanate** (BARBIERI and PAMPANINI), A., i, 225.
- Trisacriocylboric acid** (COHN), A., i, 641.
- Trisallylboric acid** (COHN), A., i, 640.
- Triquinhydroneoxonium hydrosulphide** (RICHTER), A., i, 135.
- Tri-*o*- and -*p*-tellurinium salts** (LEDERER), A., i, 857.
- Tritionucleic acid** (LEVENE and LA FORGE), A., i, 96.
- Tri-*n*-propylamine** (SCHOLL, SEER, and TRITSCH), A., i, 559.
- Tritolylcarbinol**, action of amines on (GREEN and WOODHEAD), A., i, 481.
- Tropaea**, constitution of (KÖTZ and ROSENBUSCH), A., i, 318.
- Trypanosome infection**, action of antimony on (MORGENROTH and ROSENTHAL), A., ii, 632.
- effect of arsenophenylglycine on (BROWNING and MCKENZIE), A., ii, 59, 219.
- influence of quinine and its derivatives on (MORGENROTH and HALBERSTAEDTER), A., ii, 219.
- Trypanosomes**, action of 3:5:9-triaminophenoxazonium chloride on (LAVERAN and ROUDSKY), A., ii, 911.
- Trypsin**, isoelectric point of, and nucleoprotein (MICHAELIS and DAVIDSOHN), A., i, 343.
- influence of hydrogen ion concentration on the action of (MICHAELIS and DAVIDSOHN), A., i, 1051.
- action of, on oxidation in animal tissues (BATTELLI and STERN), A., ii, 808.
- effect of calcium chloride and intestinal extract on the action of (HEKMA), A., i, 511.
- Tryptophan**, dissociation constants of (KANITZ), A., i, 97.
- Tryptophan**, preparation of, of, and its identity with indole (VAN ROYBROUCK and T.), 2068; P., 258.
- Tubes**, method of cutting (MILBAUER), A., ii, 722.
- heated, gases from (GEIGARIS), A., ii, 916.
- Tuberculin**, chemistry of (A.), ii, 916.
- formation in protein-free (LOWENSTEIN and L.), 317.
- Tumour tissues**, accumulation in (TAKEMURA), A., ii, 916.
- Tungsten**, solubility of (SIEVEKIS and BERG), 990.
- Tungstic acid**, electrolysis of (ROSENHEIM and GRISON), A., ii, 412.
- hydrosol, preparation of (A.), ii, 209.
- complex derivatives (CHELLI and BONOMO), 990.
- Metatungstic acid** (ROSENHEIM and KERN), (COPAU), A., ii, 1023.
- (A.), ii, 612.
- Tungsten**, estimation of (A.), ii, 230.
- estimation of, in steel (A. and DIECKMANN), A.
- estimation of, in water (A. of molybdenite (A.), 1139.
- Tungstic acid**. See under Tungsten.
- Turmeric oil** (RUPE and S.), i, 69, 293; (RUTE and A.), 446; (SCHIMMEL), 476.
- Turnbull's blue**, composition (WEGELIN, TREADWELL, and THALER), A., i, 541.
- Turpentine**, detection of (KLEIN), A., ii, 341.
- Turpentine oil**, Italian (SCHIMMEL and CO.), A.
- hydrogenation of (VAVON), valuation of (KLASON), A.
- detection of adulteration in wood oil or resin spirit (A.), ii, 231.
- Typewriting**, increase in rate to the work of (A.), 621.
- Typhaceae**, formation of (TELLE and HUBER), A.
- Tyrosine**, synthesis of (HOFFMAN), A., i, 499.
- fermentation of (A.), 127.

crystals of, in cheese (DOX),
ii, 429.

of, (DENIS), A., i, 773.

3,5-dichloro-, and its hydro-
lysis (WHEELER, HOFFMAN, and
JOHNSON), A., i, 923.

phosphatolysogenic acids,

salts, effect of oxidizing agents on the
absorption spectra of (JONES and
STROONG), A., ii, 168.

action of, as luminous catalysts in
the photolysis of acids (BERTHE-
LOT and GAUBRECHON), A., ii, 170.

detection of (SIEMSEN), A., ii, 773.

Uranium Azodihydroxide (RUFF and HEIN-
ZELMANN), A., ii, 858.

Uranic oxide, hydrate of (OCHSNER
DE CONING and HANNAUD), A., ii,
806.

Uranous oxide, molecular weight of
(OCHSNER DE CONING), A., ii,
804, 496.

Uranyl nitrate and its ethereal solution
(LEBEAU), A., i, 257.

hydrates of (LEBEAU), A., ii, 403.

action of acetic anhydride on
(VANINO), A., ii, 898.

phosphates, behaviour of, with in-
dicators (STARKENSTEIN), A., ii,
537.

ethylamine, methylamine, and
trimethylamine phosphates
(BACHER), A., i, 526.

salts (VASSILIEFF), A., ii, 1096.

action of light on, and ozonic
acid (BACQ), A., ii, 5.

duration of phosphorescence of
(BROCHER), A., ii, 236.

Uranium, detection of (SIEMSEN), A.,
ii, 239.

estimation of, volumetrically (BROTH-
SON and CLARKE), A., ii, 443.

Uranium A, secondary emanations pro-
duced by (HOFER), A., ii, 569.

Uranium earths, estimation of radium in
(MACKWALD and RUSSELL), A., ii, 360.

Uranous oxide. See under Uranium.

Uranyl salts. See under Uranium.

Urea, formation of, from ammonium
salts in the body (WAKEMAN and
HARRIS), A., ii, 629.

influence of, on the blood and milk
of suckling women (KUGEL and
MURCHHAUSER), A., ii, 629.

analytical methods relating to:—

action of hexamethylenetetramine (SCHÖNBERG, A., ii, 843).

action of iodic acid in (KOZŁOWSKI, A., ii, 553).

action of iron in (REICH, A., ii, 13).

metric estimation of mercury in (ZIMMERMANN, A., ii, 772).

action of phenol and p-cresol in (FRIEDL and ZIMMERMANN, A., ii, 941).

various, estimation of phenols in (DUBIL and MOSSER, A., ii, 942).

action of phosphates in (AMANN, A., ii, 536).

action of potassium in (GREEN, A., ii, 1135).

action of surn in (GAERTEL, A., ii, 1); (FELSNER, RANG, A., ii, 1).

action of sulphur in (DENTS, A., ii, 66); (SCHMIDT, A., ii, 67); (INSECT, A., ii, 139); (SÄCK, A., ii, 626).

action of trimethylamine in (FAC, A., ii, 559).

metric estimation of triethylamine in (KINOSHITA, A., ii, 743).

action of urea in (HENRIQUES and FREUD, A., ii, 679).

action of uric acid in (PAGANO, A., ii, 697); (VIGARI, A., ii, 773).

separation of, from its bromine (INSECT, A., ii, 135).

action of, and its relation to bromine in (SIMON, A., ii, 209).

action and detection of (CARRIZ, A., ii, 944).

metric estimation of (MEISS, A., ii, 117).

action, estimation of (WEISZ, A., ii, 95).

action, influence of oxidation on (ADRIAN and PAUL, A., ii, 846).

products of urine (A. SOD, A., ii, 109).

constituents of (GASCHNER, A., ii, 647).

V.

the electron reception of (L. and NELSON, A., ii, 194).

action of, to oxidation of gases (KAS and FLETCHER, A., ii, 1).

chloral, bromine (CHEM, LEBER, GIDEON, RICHIE, A., ii, 8).

n-Valeric acid, *di*-methylhexylcarbonyl ester of (HILDEBRAND, T., 222).

Valeric acid, *d*- and *l*- γ -amino-, and *d*- and *l*- γ -benzylamino- (FISCHER and GROSS, A., ii, 778).

S-Valerolactone, and its ethyl ester (LEFEBVRE, A., ii, 106).

is-Valeric acid, benzyl ester (SARATIER and MAURY, A., ii, 258).

is-Valeric acid, α -bromo-, and α -iodo-, geminal esters of, and poly ester of the latter, and *n*- α -bromo-, and *d*- α -iodo-, quaternary esters of, (FABRY and FABRY, A., ii, 630).

tert-Valerylacetic acid (Wahlberg, A., ii, 707).

tert-Valerylacetamide (WIDMAN and WAHLBERG, A., ii, 702).

tert-Valerylacetimino ether, hydrochloride and platinum chloride (WIDMAN and WAHLBERG, A., ii, 702).

tert-Valerylacetonitrile. See Paralodin, *see* value.

is-Valerylaminooacetophenone, α -bromo- (HEINRICH, WOLKE, VORM, Dr. HEINRICH, BAY, A., ii, 823).

is-Valerylaminooacetophenone, α -bromo- (KEMMEL, T., 625, P., 72).

is-Valerylaminooacetophenone, α -bromo- (HOLMANN and WEIZMANN, T., 1581).

is-Valerylidene 9-phenylrhodanilic acid (BUTSCHER, A., ii, 631).

tert-Valerylmethylacetic acid, and its ethyl ester (Wahlberg, A., ii, 707).

Valve cells. See under Electrochemistry.

Vanadic acid. See under Vanadium.

Vanadium atomic weight of (McADAM, A., ii, 117).

Vanadyl bromide (RUFF and LUCK, A., ii, 891).

Vanadium chlorides (RUFF and LUCK, A., ii, 891).

tert-, *tert*-, and *pent*-fluorides (RUFF and LUCK, A., ii, 889).

Vanadyl *di*- and *tri*-fluorides (RUFF and LUCK, A., ii, 889).

Vanadium pentoxide, action of calcium fluoride on (FRANKE and MANZ, A., ii, 100).

Vanadic acid, colloidal, preparation of (MUTTER, A., ii, 732).

estimation of, in the presence of phosphoric acid (EUGER, A., ii, 71).

Vanadium, estimation of, in the presence of arsenic (TRAUTMANN, A., ii, 544).

estimation of silicon in, and in its iron alloys (TRAUTMANN, A., ii, 538).

and its estimation of, volumetrically (MUTTER and DUEPPELHAUER, A., ii, 524).

- Vanadium**, separation of iron and (DEISS and LEYNAHT), A., ii, 939.
- Vanadyl salts**. See under Vanadium.
- Vanilla**, action of ultra-violet light on the green husks of (POUGNET), A., ii, 523.
- 4-Vanillin methyl carbonate** (PAULY, SCHUBEL, and LOCKEMANN), A., i, 788.
- 3,4-Vanillin methyl carbonate** (PAULY, SCHUBEL, and LOCKEMANN), A., i, 789.
- Vanillin-*p* methoxyphenylhydrazones** (PAPOA and SANTI), A., i, 1030.
- 3-Vanillylideneamino 2-methyl-4-quinazolone** (BOGERT, HELL, and AMEND), A., i, 163.
- Vapour density**, determination of, of volatile substances (MENZIES), A., ii, 94.
influence of catalysts in determination of (KLING), A., ii, 371.
- Vapour lines**, retrogressive (SMITH), A., ii, 855.
- Vapour pressure**, studies in (SMITH and MENZIES), A., ii, 114.
optical measurement of (CUTHBERTSON and CUTHBERTSON), A., ii, 582.
calculation of, in univariant systems (URBAIN and SCAL), A., ii, 370.
alterations in, as a means of showing the existence of compounds (KRULLA), A., ii, 480.
variation of, with temperature (CEDERBERG), A., ii, 966.
heat of vaporisation and temperature, relation between (CEDERBERG), A., ii, 854.
of hydrates, determination of (PARTINGTON), P., 12.
of liquids, causes of the constant temperature variation in (MICHARD), A., ii, 371.
in binary systems of partially miscible liquids (KOHNSHAMM and TIMMERMANS), A., ii, 370.
- Vapours**, condensation of (BECKER), A., ii, 1063.
- Variscite**, crystallised, from Utah (SCHALLER), A., ii, 1103.
- Vaso motor centre**, effects of asphyxia on the (MATHISON), A., ii, 617.
- Vegetariane**, action of animal proteins on (ALBERTONI and ROSSI), A., ii, 411.
- Vegetation**, effect of road tarring on (MIRANDE), A., ii, 64.
- Velocity of racemisation**. See under Affinity, chemical.
- Velocity of reaction**. See under Affinity, chemical.
- o-Veratraldehyde**, derivatives of (PERKIN, ROBERTS, and ROBINSON), P., 57.
- Veratraldehyde**, 6-nitro-, action of, with acetone and alkalies (SCHULZE), A., i, 577.
- o-Veratric acid** (PERKIN, ROBERTS, and ROBINSON), P., 57.
- Veratrine**, action of, on strychnine (LAMME), A., ii, 813.
effect of, on muscle and nerve (LEONARD), A., ii, 138.
- Veratrole**, 3:4:5-trinitro-, action of, on (KLEMENC), A., i, 779.
- α-Veratryl 88 dimethylfulginate** (STORBE and LENZNER), A., i, 374.
- α-Veratryl 88 dimethylfulginate** and LENZNER, A., i, 374.
- γ-Veratrylitaconic acid**, action of, on salt and anhydride (LEUNER), A., i, 375.
- Veratrylnorhydrohydrastizine** and GAMS, A., i, 807.
- Verbascon thapsig**, action of, on derivatives from (KLEIN), A., i, 972.
- Verbasterol** and its action (KLOBB and EHEW), A., i, 807.
- Vernine**, identity of, with (SCHULZE and THIER), A., i, 156.
- Veronal**, toxicity of (GAMM), A., ii, 316.
pharmacology of (BOWEN and ROEMER), JAC, ii, 1120.
detection of (JONES), A., ii, 815.
forensic detection of (HARRIS), A., ii, 815.
- Viburnum luteum**, fruit of (HARRIS), A., ii, 529.
- Vicianin**, constitution of (KLEIN and WEISWEILER), A., i, 156.
- Vicianose**, constitution of (KLEIN and WEISWEILER), A., i, 156.
- Vicine**, constitution of (KLEIN and THIER), A., i, 156.
- 1-Vinyl-Δ¹-cyclohexene** (HARRIS), A., ii, 959.
- 5-Vinylideneamino-4-xylenol** (GOLDBER), A., i, 580.

- 4-*m*-Xyleneazo-5-hydroxy-3-methylisoxazole (BÜLOW and HECKING), A., i, 245.
- 4-*m*-Xyleneazo-5-hydroxy-3-methylpyrazole (BÜLOW and HECKING), A., i, 405.
- 4-*m*-Xyleneazo-5-hydroxy-1-methylpyrazole (BÜLOW and HECKING), A., i, 405.
- 4-*m*-Xyleneazo-3-phenyl- (MEYER), A., i, 841.
- m*-Xylenol, 5-chloro-, 1:2- (ORTON and KING), T., 135.
- p*-2 Xylenol, 3:6-*di*bromo-4:5-3:6-*di*bromo-5-nitro-, and derivative (ZINCKE and BIERING), A., i, 216.
- m*-Xyldine, 5-chloro- (ORTON and T.), 1188.
- o*-4 Xylenyl acetates, and derivatives (DIEFOLDER), 853.
- o*-3 Xyldine, 4:5-, 4:6-, and 4:7- and their acetyl derivatives (ORTON and MORRELL), T., 244.
- o*-4 Xyldine, 3:4:5-*tri*-, and 3:4:5-*tri*- and their acetyl derivatives (ORTON and MORRELL), T., 244.
- m*-4 Xyldylcamphorformic acid and its derivatives (TINGLE and BATES), A., i, 1021.
- p*-Xyloquinol, *di*bromo- (ZINCKE and BIERING), 216.
- Xyloquinone, 8-lactone (ORTON and BEKEZA), A., i, 46.
- p*-Xyloquinone, action of methyl iodide on (BLANCHEY), A., i, 884.
- 2-*m*-Xyloylbenzoic acid, 5-chloro- (BAMSHIDE and FABRIK), A., i, 885.
- 3-(*m*-4)-Xyloypicolinic acid (ORTON and T.), 1021.
- o*- and *p*-Xylyl iodide (ORTON and T.), 442.
- disulphide (STREZELKA), 196.
- p*-Xylyl sulphide (MARTIN), 195.
- o*-4-, *m*-4-, and *p*-5 Xylyl osmichloride (GRIFFITH and INGER), A., i, 191.
- platinibromide (GRIFFITH and OBERMAIER), A., i, 191.
- α*-*o*-, *m*-, and *p*-Xylyl azo dioxiphenone (HALLER and BAUER), 726.
- o*- and *m*-Xylyldimethyl- (HALLER and BAUER), A., i, 726.
- α*-, *m*-, and *p*-Xylyldimethyl- inol (HALLER and BAUER), 726.
- o*-Xylyleneconhydrium- (HALLER and BAUER), A., i, 327.
- o*-Xylylenestilbazolinium- (HALLER and BAUER), A., i, 327.

- Me*: *Me* = 1:2; *m-xylene*, *Me*: *Me* = 1:3; *p-xylene*, *Me*: *Me* = 1:4.)
 and *p*-xylylenedipiperidine (SOLTZ), A., i, 327.
 xylylenedipiperidinium (ATZ), A., i, 326.
 yl ethers (PAWLOW-SKY),
 3 ethylisindolinone. 3
 KUHARA and KOMATSU,
 and *p*-2 Xylylmethylallyl-
 MAISHUREVINICH, A., i,
 3 methylisindolinone. 3
 KUHARA and KOMATSU,
 and *p*-Xylylphthalamide
 and KOMATSU, A., i, 207.
 3, *m*-4, and *p*-Xylyl-
 KUHARA and KOMATSU,
 4 pyridyl ketone and its
 CLAU, A., i, 1021.
 ione (MARTYNOWICZ), A., i,
 oxide (MARTYNOWICZ), A.,
 Y.
 nce of acids and alkalis on
 lysis of (NAVASSAR), A.,
 of antiseptics on the autolysis
 (ASARI), A., ii, 610.
 pl salts on the autofermenta-
 (HALLER and PAINET), P.,
 of zymase from (*v. LEE*,
 A., i, 248; ii, 539;
 (RESE), A., i, 1051;
 A., ii, 421, 640.
 the enzymes of (*v. ELLER*
 (RESE), A., ii, 817.
 glycogen in (HENSENBERG),
 9.
 er with (*v. ELLER* and
 (RESE), A., ii, 640.
 on sugar free (NEUBERG and
 (RESE), A., ii, 329; (NEU-
 4 TIER), A., ii, 529; (NEU-
 4 KARZAG), A., ii, 1019.
 arsenic compounds on the
 tion of sugars by (HAGEN-
 SG), A., ii, 519.
 o-fumino acids in fermenta-
 (NEUBERG and FROMMERT),
 1.
 of furfuraldehyde by
 and *v. LIEBIG*, A., ii,
 Yeast, degradation of nitrogenous sub-
 stances by (SCHWARZ), A., ii, 640.
 formation of plasma protein by
 (FREUDL), A., ii, 1122.
 food value of (VOLTZ and BAPPEXEL),
 A., ii, 215.
 utilisation of, in the human body
 (VOLTZ and BAPPEXEL), A., ii,
 301.
 Yeasts, assimilation of different carbo-
 hydrates by different (LINSENER and
 SATO), A., ii, 758.
 Yeast cells, alteration in the fermentative
 properties of, after killing by acetone
 (HELGES and SATO), A., ii, 914.
 Yeast gum (*v. ELLER* and FOLCH), A.,
 i, 697; (SALKOWSKI), A., i, 825.
 behaviour of, in autolysis and fermenta-
 tion (SALKOWSKI), A., ii, 62.
 Yeast juice, hexosephosphoric acid from
 (YOUNG), A., i, 422.
 Yeast nucleic acid (LEVENE and JACOBS),
 A., i, 96, 519.
 Yohimbine, effect of, on muscle and
 nerve (WALLER), A., ii, 138.
 Yttrium, organic salts of (PRATT and
 JAMES), A., ii, 893.
 Yttrium earths, fractionation of (BEN-
 NER), A., ii, 286.
 Yttriofluorite from Norway (VON), A.,
 ii, 733.
 Z.
 Zein, a toxin of the pancreatic juice on
 (BASTONI), A., ii, 999.
 Zeolites, constitution of (BASCHIERI),
 A., ii, 592.
 from Hungary (MAULIZ), A., ii, 46.
 Zinc, spectrum of (PASCHEN), A., ii,
 893.
 apparatus for demonstrating the
 action of acids of pure and impure
 (CASPER), A., ii, 279.
 and manganese, joint influence of,
 on the development of *Aspergillus*
noyer (BERTRAND and JAVILLIER),
 A., ii, 421.
 silver and lead, equilibrium in the
 system (KREMAN and HOEFER),
 A., ii, 884.
 Zinc alloys with aluminium (ROSENHAIN
 and ARBERG), A., ii, 895.
 with lead and tin (LEVI-MALINARO
 and CROCELLI), A., ii, 1088,
 1089.
 with zinc, equilibrium of, in rela-
 tion to the dark cell (COHEN and
 VAN GINNEKEN), A., ii, 14.
 with nickel (VIGORGO and BOSS-

- Zinc alloys**, with silver and lead, potential of (KREMMANN and HOFMEIER), A., ii, 848.
with tellurium (KOBAYASHI), A., ii, 1089.
- Zinc bromide and chloride**, efficiency of, as drying agents (BAXTER and WARREN), A., ii, 268.
chloride, compound of, with aniline (HOLGERS), A., i, 191.
chromates (GROGER), A., ii, 283.
molybdate. See Zinc peroxide.
nitrate, ammonia and water, equilibrium in the system (STABEVLICH), A., ii, 476.
nitride, presence of, in commercial zinc (MATIGNON), A., ii, 605.
oxide, solubility of, in fused lead silicate and borate (HOLDICROFT), A., ii, 953.
peroxides (KAZANECKY: CARRASCO), A., ii, 282; (TELETOFF), A., ii, 490.
peroxide (zinc molybdate; zinc peroxydate) (EBLER and KRAUSE), A., ii, 801.
sulphate, precipitation of proteins by (LIPPICH), A., i, 934.
- Zinc organic compounds**, and their use in organic syntheses (BLAISE), A., i, 415.
reaction between, and unsaturated compounds (KÖHLER, HERFAGE, and MACLEOD), A., i, 862.
- Zinc organic compounds**, chlorides of alkyl (BLAISE and PICARD), 260.
action of, on ethyl (SHDANOVITSCH), A.
- Zinc**, precipitation of, (SCHIRM), A., ii, 11.
estimation of, electrolytically (MERER), A., ii, 555.
estimation of, gravimetrically (GRUND), A., ii, 855.
estimation of, volumetrically (HAGUE), A., ii, 155.
separation and estimation of, (REACT and VILA), A.
- Zinc blende**, influence of, on sulphur content of, (A.), ii, 283.
- Zinc minerals** from K... (ROGERS), A., ii, 500.
- Zirconium**, estimation of, (A.), ii, 771.
- Zygadenus intermedia*, physiological effects of, and SMITH, A., ii, 325.
analysis of (HEAL and H.), ii, 325.
- Zymase**, extraction and estimation of, (DEFF), A., i, 225.
extraction of, from yeast (DEFF), A., i, 215.
(RINCKLEGEN), A., i, 215.
(KAYSER), A., ii, 11.

ERRATA.

COLLECTIVE INDEX 1893-1902.

PART II. SUBJECTS.

- Vol.
 ii *delete* "isolated." "
 ii " " GABRIEL and NEUMANN, 1893, A, i, 346."
 i " " See 2, 5 Diphenylpyrazine."
 i *insert* " (GABRIEL and NEUMANN, 1893, A, i, 346)

VOL. LXXXVI (ABSTR., 1904).

PART I.

see "Malonobenzylamide" *read* "Malobenzylamide."

"SANDERLIN" *read* "GANDERLIN."
